

6-axis IMU (inertial measurement unit) with enhanced vibration immunity, dual accelerometer up to $\pm 320\text{ g}$, and embedded AI

LGA-14L
(2.5 x 3.0 x 0.83 mm) typ.

Features

- Enhanced vibration immunity
- PFAS-, lead-, and BPA-free
- Quad-channel architecture for UI, EIS, OIS, and high-g data processing
- "Smart, always-aware" experience for system power optimization
- Dual accelerometer channels
 - Low-g channel $\pm 2/\pm 4/\pm 8/\pm 16\text{ g}$ full scale
 - High-g channel $\pm 32/\pm 64/\pm 128/\pm 256/\pm 320\text{ g}$ full scale
- Gyroscope full scale: $\pm 250/\pm 500/\pm 1000/\pm 2000/\pm 4000\text{ dps}$
- SPI / I²C & MIPI I3C[®] v1.1 serial interface with main processor data synchronization
- Auxiliary SPI & MIPI I3C[®] v1.1 for OIS data output for gyroscope and accelerometer
- Programmable finite state machine for accelerometer (high-g & low-g), gyroscope, and external sensor data processing with high rate @ 960 Hz
- Machine learning core with exportable features and filters for AI applications
- Embedded adaptive self-configuration (ASC)
- Embedded sensor fusion low-power (SFLP) algorithm
- OIS configurable from the auxiliary or primary interface
- EIS dedicated channel on primary interface with dedicated filtering
- Advanced pedometer, step detector, and step counter
- Significant motion detection, tilt detection
- Standard interrupts: free-fall, wake-up, 6D/4D orientation, click and double click, high-g wake-up and high-g shock
- Smart FIFO up to 4.5 KB
- Embedded temperature sensor
- Independent I/O supply
 - I²C voltage range: 1.62 V to 3.6 V
 - SPI / MIPI I3C[®] extended voltage range: 1.08 V to 3.6 V
- Supply current
 - 6-axis configuration @ 0.67 mA in combo high-performance mode
 - 9-axis configuration @ 0.80 mA in combo high-performance mode
- Compact footprint: 2.5 mm x 3 mm x 0.83 mm
- **ECOPACK** and RoHS compliant

Product status
LSM6DSK320X

Product summary	
Order code	LSM6DSK320XTR
Temp. range [°C]	-40 to +85
Package	LGA-14L (2.5 x 3.0 x 0.83 mm)
Packing	Tape and reel

Product resources

Applications

- Wearables
- Smart tags
- Drones
- Asset monitors
- Event data recorders (EDRs)
- Structural health monitoring (SHM) of buildings and bridges
- Personal protective equipment (severity of falls or impacts)
- Gaming controllers

Description

The **LSM6DSK320X** is a compact, low-power, high-performance IMU that integrates a 3-axis digital low-g accelerometer with selectable full scale up to $\pm 16\text{ g}$, a 3-axis digital high-g accelerometer up to $\pm 320\text{ g}$, and a 3-axis digital gyroscope. Its advanced architecture processes acceleration and angular-rate data through four independent channels: User Interface (UI), OIS, EIS, and high-g acceleration.

Designed for demanding motion-sensing applications, the LSM6DSK320X enables intense movement tracking, shock and concussion monitoring, and other high-dynamic use cases.

The device features a new gyroscope architecture with a fully differential readout chain and enhanced mechanical symmetry, delivering outstanding vibration immunity and resilience to external disturbances. It also supports edge AI functions through a finite state machine (FSM) for configurable motion detection and a machine learning core (MLC) for context awareness, enabling intelligent features for personal electronics, IoT, sports and wearables, and drone applications.

To optimize power consumption, the LSM6DSK320X includes adaptive self-configuration (ASC), which automatically adjusts sensor settings in real time based on detected motion patterns or MLC events, without host intervention. The digital subsystem also integrates ST's sensor fusion low-power (SFLP) technology for spatial orientation.

In addition, a dedicated high-g acceleration sensor with an independent channel and dedicated filtering ensures reliable shock detection, making the device well suited for sports, concussion detection, impact detection, emergency call, and drone applications.

1 Overview

The LSM6DSK320X is a system-in-package IMU integrating a high-performance 3-axis digital low-*g* accelerometer, a 3-axis digital high-*g* accelerometer, and a 3-axis digital gyroscope. It provides advanced motion sensing capabilities for applications requiring accurate detection of orientation, gestures, and high-dynamic events.

The device supports event-detection interrupts for hardware recognition of free-fall, 6D orientation, single and double click, activity/inactivity, stationary/motion, and wake-up events. Embedded machine learning core (MLC) and finite state machine (FSM) processing enable selected motion-analysis algorithms to be executed within the sensor, reducing host processor workload and contributing to lower system power consumption.

The LSM6DSK320X is compliant with main operating system requirements and supports real, virtual, and batch-mode sensor operation. It is designed to implement hardware functions such as significant motion detection, stationary/motion detection, tilt, pedometer, timestamping, and acquisition from external sensors.

The device offers a flexible pin configuration to support the connection of external sensors and extended functionality, including sensor hub operation and auxiliary SPI/I²C[®] interfaces.

For cameras, the LSM6DSK320X provides dedicated support for OIS and EIS applications. These channels use independent processing paths and filtering. Enhanced EIS gyroscope data are available through I²C, MIPI I³C[®] v1.1, or SPI interfaces.

The device features four operating channels:

Channel 1: user interface motion processing, with accelerometer and gyroscope data available through I²C/SPI/I³C, and independent ODR and FS settings

Channel 2: OIS processing, with data available through auxiliary SPI or I³C at 7.68 kHz, supporting independent FS.

Channel 3: EIS enhanced, with data available in free-run mode or via FIFO, including dedicated tag and timestamp support.

Channel 4: high-*g* acceleration, with independent full-scale settings from $\pm 32\text{ g}$ to $\pm 320\text{ g}$.

A 4.5 KB FIFO with compression and dynamic allocation for significant data, including external sensor data and timestamps, contributes to overall system power savings.

The LSM6DSK320X also integrates ST's sensor fusion low-power (SFLP) algorithm, which provides a 6-axis game rotation vector expressed as a quaternion. The X, Y, and Z quaternion components are stored in the FIFO.

The device is based on robust in-house manufacturing processes for micromachined accelerometers and a new symmetric gyroscope architecture designed to improve resistance to process variation and external vibration. It combines specialized micromachining with CMOS technology to achieve optimized sensor characteristics.

Additional embedded features include FSM, MLC, adaptive self-configuration (ASC), sensor fusion low power, and dedicated filtering for OIS, EIS, and motion processing.

The LSM6DSK320X is available in a small plastic, land grid array (LGA) package of 2.5 x 3.0 x 0.83 mm, suitable for ultracompact solutions.

2 Embedded low-power features

The LSM6DSK320X features the following on-chip functions:

- 4.5 KB FIFO data buffering, data can be compressed two or three times
 - 100% efficiency with flexible configurations and partitioning
 - Possibility to store timestamp
- Event-detection interrupts (fully configurable)
 - Free-fall
 - Wake-up
 - 6D orientation
 - Click and double-click sensing
 - Activity/inactivity recognition
 - Stationary/motion detection
 - High-g wake-up and high-g shock
- Specific IP blocks (called "embedded functions") with negligible power consumption and high performance
 - Pedometer functions: step detector and step counters
 - Tilt
 - Significant motion detection
 - Finite state machine (FSM)
 - Machine learning core (MLC) with exportable features and filters for AI applications
 - Adaptive self-configuration (ASC)
 - Embedded sensor fusion low-power (SFLP) algorithm
- Sensor hub
 - Up to six total sensors: two internal (accelerometer and gyroscope) and four external sensors

2.1 Pedometer functions: step detector and step counters

The LSM6DSK320X embeds an advanced pedometer with an algorithm running in an ultralow-power domain in order to ensure extensive battery life in battery-constrained applications.

Leveraging enhanced configurability, the advanced embedded pedometer is suitable for a large range of applications from mobile to wearable devices.

The algorithm processes and analyzes the accelerometer waveform in order to count the user's steps during walking and running activities.

The pedometer works at 30 Hz and it is not affected by the selected device power mode (ultralow-power, low-power, high-performance), thus guaranteeing an ultralow-power experience and extreme flexibility in conjunction with other device functionalities.

The pedometer output can be batched in the device's FIFO buffer, in order to decrease overall system supply current.

ST freely provides the support and the tools for easily configuring the device and tuning the algorithm configuration for a best-in-class user experience.

2.2 Pedometer algorithm

The pedometer algorithm is composed of a cascade of four stages:

1. Computation of the acceleration magnitude signal in order to detect the signal independently from device orientation;
2. FIR filter to extract relevant frequency components and to smooth the signal by cutting off high frequencies;
3. Peak detector to find the maximum and minimum of the waveform and compute the peak-to-peak value;
4. Step count: if the peak-to-peak value is greater than the settled threshold, a step is counted.

Figure 1. Four-stage pedometer algorithm

The LSM6DSK320X embeds a dynamic internal threshold for step detection that is updated after each peak-to-peak evaluation: the internal threshold is increased with a configurable speed if a step is detected or decreased with a configurable speed if a step is not detected.

This approach ensures high accuracy when the user starts to walk and a false peak rejection when the user is walking or running.

An internal configurable debounce algorithm can be also set to filter false walks: indeed, an accelerometer pattern is recognized as a walk or run only if a minimum number of steps are counted.

The LSM6DSK320X has been designed to reject a false-positive signal inside the algorithm core.

On top of the mechanisms detailed above, the LSM6DSK320X allows enabling and configuring a dedicated false-positive rejection block to further boost pedometer accuracy.

2.3 Tilt detection

The tilt function helps to detect activity change and has been implemented in hardware using only the accelerometer to achieve targets of both ultralow power consumption and robustness during the short duration of dynamic accelerations.

The tilt function is based on a trigger of an event each time the device's tilt changes and can be used with different scenarios, for example:

- Triggers when a phone is in a front pants pocket and the user goes from sitting to standing or standing to sitting;
- Does not trigger when a phone is in a front pants pocket and the user is walking, running, or going upstairs.

2.4 Significant motion detection

The significant motion detection (SMD) function generates an interrupt when a 'significant motion', that could be due to a change in user location, is detected. In the LSM6DSK320X device this function has been implemented in hardware using only the accelerometer.

SMD functionality can be used in location-based applications in order to receive a notification indicating when the user is changing location.

2.5 Finite state machine

The LSM6DSK320X can be configured to generate interrupt signals activated by user-defined motion patterns. To do this, up to 8 embedded finite state machines can be programmed independently for motion detection such as glance gestures, absolute wrist tilt, shake and double-shake detection.

Definition of finite state machine

A state machine is a mathematical abstraction used to design logic connections. It is a behavioral model composed of a finite number of states and transitions between states, similar to a flow chart in which one can inspect the way logic runs when certain conditions are met. The state machine begins with a start state, goes to different states through transitions dependent on the inputs, and can finally end in a specific state (called stop state). The current state is determined by the past states of the system. The following figure shows a generic state machine.

Figure 2. Generic state machine

Finite state machine in the LSM6DSK320X

The LSM6DSK320X works as a combo accelerometer-gyroscope sensor, generating acceleration and angular rate output data. It is also possible to connect an external sensor like a magnetometer or pressure sensor by using the sensor hub feature (mode 2). These data can be used as input of up to 8 programs in the embedded finite state machine (Figure 3. State machine in the LSM6DSK320X).

All 8 finite state machines are independent: each one has its dedicated memory area and it is independently executed. An interrupt is generated when the end state is reached or when some specific command is performed.

Figure 3. State machine in the LSM6DSK320X

High-g peak tracking feature

The high-g accelerometer peak tracking feature allows monitoring the magnitude of the high-g accelerometer within a time window that can be defined by issuing dedicated commands from the finite state machine. When issuing the command related to the end of the monitoring window, this feature stores the high-g accelerometer three-axis components of the detected peak in the FIFO with a dedicated TAG.

2.6 Machine learning core

The LSM6DSK320X embeds a dedicated core for machine learning processing that provides system flexibility, allowing some algorithms run in the application processor to be moved to the MEMS sensor with the advantage of consistent reduction in power consumption.

Machine learning core logic allows identifying if a data pattern (for example motion, pressure, temperature, magnetic data, and so forth) matches a user-defined set of classes. Typical examples of applications could be activity detection like running, walking, driving, and so forth.

The LSM6DSK320X machine learning core works on data patterns coming from the low-g, high-g accelerometer and gyroscope sensors, but it is also possible to connect and process external sensor data (like magnetometer or pressure sensor) by using the sensor hub feature (mode 2).

The input data can be filtered using a dedicated configurable computation block containing filters and features computed in a fixed time window defined by the user. Computed feature values and filtered data values can also be read through the FIFO buffer.

Machine learning processing is based on logical processing composed of a series of configurable nodes characterized by "if-then-else" conditions where the "feature" values are evaluated against defined thresholds.

Figure 4. Machine learning core in the LSM6DSK320X

The LSM6DSK320X can be configured to run up to 8 decision trees simultaneously and independently and every decision tree can generate up to 16 results. The total number of nodes can be up to 256.

The results of the machine learning processing are available in dedicated output registers readable from the application processor at any time.

The LSM6DSK320X machine learning core can be configured to generate an interrupt when a change in the result occurs.

2.7 Adaptive self-configuration (ASC)

The LSM6DSK320X supports the adaptive self-configuration (ASC) feature, which allows the FSM to automatically reconfigure the device in real time based on the detection of a specific motion pattern or based on the output of a specific decision tree configured in the MLC, without any intervention from the host processor. The FSM can write a subset of the device registers using the SETR command, which allows indicating the register address and the new value to be written in such a register. The access to these device registers is mutually exclusive to the host.

2.8 Sensor fusion low power

A sensor fusion low-power (SFLP) block is available in the LSM6DSK320X for generating the following data based on the (low-g) accelerometer and gyroscope data processing:

- Game rotation vector, which provides a quaternion representing the attitude of the device
- Gravity vector, which provides a three-dimensional vector representing the direction of gravity
- Gyroscope bias, which provides a three-dimensional vector representing the gyroscope bias

The SFLP block is enabled by setting the SFLP_GAME_EN bit to 1 of the **EMB_FUNC_EN_A (04h)** embedded functions register.

The SFLP block can be reinitialized by setting the SFLP_GAME_INIT bit to 1 of the **EMB_FUNC_INIT_A (66h)** embedded functions register.

3.1 Pin connections

The LSM6DSK320X offers flexibility to connect the pins in order to have three different mode connections and functionalities. In detail:

- **Mode 1:** I²C / MIPI I3C[®] target interface or SPI (3- and 4-wire) serial interface is available.
- **Mode 2:** I²C / MIPI I3C[®] target interface or SPI (3- and 4-wire) serial interface and I²C controller interface for external sensor connections are available.
- **Mode 3:** I²C / MIPI I3C[®] target interface or SPI (3- and 4-wire) serial interface is available for the application processor interface while an auxiliary MIPI I3C[®] / SPI (3- and 4-wire) serial interface for external sensor connections is available for the accelerometer and gyroscope.

4.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 9. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
VDD	Supply voltage	-0.3 to 4.8	V
T _{STG}	Storage temperature range	-40 to +125	°C

ESD	Electrostatic discharge protection (HBM)	2	kV
V _{in}	Input voltage on any control pin (including CS, SCL/SPC, SDA/SDI/SDO, SDO/TA0)	-0.3 to VDDIO +0.3	V

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

4.6 Terminology

4.6.1 Sensitivity

Linear acceleration sensitivity can be determined, for example, by applying 1 *g* acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, ± 1 *g* acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors (see [Table 3](#)).

An angular rate gyroscope is a device that produces a positive-going digital output for counterclockwise rotation around the axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time (see [Table 3](#)).

4.6.2 Zero-g and zero-rate level

Linear acceleration zero-*g* level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface measures 0 *g* on both the X-axis and Y-axis, whereas the Z-axis measures 1 *g*. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-*g* offset.

Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-*g* level change vs. temperature" in [Table 3](#). The zero-*g* level tolerance (TyOff) describes the standard deviation of the range of zero-*g* levels of a group of sensors.

Zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time (see [Table 3](#)).

5 Digital interfaces

5.1 I²C/SPI interface

The registers embedded inside the LSM6DSK320X may be accessed through both the I²C and SPI serial interfaces. The latter may be software configured to operate either in 3-wire or 4-wire interface mode. The device is compatible with SPI modes 0 and 3.

The serial interfaces are mapped to the same pins. To select/exploit the I²C interface, the CS line must be tied high (that is, connected to VDDIO).

Table 10. Serial interface pin description

Pin name	Pin description
CS	Enables SPI I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled)
SCL/SPC	I ² C serial clock (SCL) SPI serial port clock (SPC)
SDA/SDI/SDO	I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
SDO/TA0	SPI serial data output (SDO) I ² C less significant bit of the device address

5.1.1 I²C serial interface

The LSM6DSK320X I²C is a bus target. The I²C is employed to write the data to the registers, whose content can also be read back.

The relevant I²C terminology is provided in the table below.

Table 11. I²C terminology

Term	Description
Transmitter	The device that sends data to the bus
Receiver	The device that receives data from the bus
Controller	The device that initiates a transfer, generates clock signals, and terminates a transfer
Target	The device addressed by the controller

There are two signals associated with the I²C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to VDDIO through external pull-up resistors. When the bus is free, both the lines are high.

The I²C interface is implemented with fast mode (400 kHz) I²C standards as well as with fast mode plus (1000 kHz).

In order to disable the I²C block, I2C_I3C_disable = 1 must be written in IF_CFG (03h).

5.1.2 I²C operation

The transaction on the bus is started through a start (ST) signal. A start condition is defined as a high to low transition on the data line while the SCL line is held high. After this has been transmitted by the controller, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the target in the first 7 bits and the eighth bit tells whether the controller is receiving data from the target or transmitting data to the target. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the controller.

The target address (TAD) associated to the LSM6DSK320X is 110101xb. The SDO/TA0 pin can be used to modify the less significant bit of the device address. If the SDO/TA0 pin is connected to the supply voltage, LSb is 1 (address 1101011b); else if the SDO/TA0 pin is connected to ground, the LSb value is 0 (address 1101010b). This solution permits to connect and address two different inertial modules to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver that has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LSM6DSK320X behaves like a target device and the following protocol must be adhered to. After the start condition (ST) a target address is sent, once a target acknowledge (TAK) has been returned, an 8-bit subaddress (SUB) is transmitted. The increment of the address is configured by the CTRL3 (12h) (IF_INC).

The target address is completed with a read/write bit. If the bit is 1 (read), a repeated start (SR) condition must be issued after the two subaddress bytes; if the bit is 0 (write) the controller transmits to the target with direction unchanged. Table 12 explains how the TAD+read/write bit pattern is composed, listing all the possible configurations.

Table 12. TAD+read/write patterns

Command	TAD[6:1]	TAD[0] = TA0	R/W	TAD+R/W
Read	110101	0	1	11010101 (D5h)
Write	110101	0	0	11010100 (D4h)
Read	110101	1	1	11010111 (D7h)
Write	110101	1	0	11010110 (D6h)

Table 16. Transfer when controller is receiving (reading) multiple bytes of data from target

Controller	ST	TAD+W		SUB		SR	TAD+R			MAK		MAK		NMAK	SP
Target			TAK		TAK			TAK	DATA		DATA		DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a target receiver does not acknowledge the target address (that is, it is not able to receive because it is performing some real-time function) the data line must be left high by the target. The controller can then abort the transfer. A low to high transition on the SDA line while the SCL line is high is defined as a stop condition. Each data transfer must be terminated by the generation of a stop (SP) condition.

In the presented communication format, CAK is controller acknowledge and NCAK is no controller acknowledge.

5.1.3 SPI bus interface

The SPI on the LSM6DSK320X is a bus target that allows writing and reading the registers of the device.

Figure 10. Read and write protocol (in mode 3)

CS enables the serial port and it is controlled by the SPI controller. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI controller. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in the case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: $\overline{RW}$ bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods are added. When the **CTRL3 (12h) (IF_INC)** bit is 0, the address used to read/write data remains the same for every block. When the **CTRL3 (12h) (IF_INC)** bit is 1, the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.1.3.1 SPI read

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

bit 16-...: data DO(...-8). Further data in multiple byte reads.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple byte writes.

Figure 14. Multiple byte SPI write protocol (2-byte example) (in mode 3)

5.1.3.3 SPI read in 3-wire mode

3-wire mode is entered by setting the IF_CFG (03h) (SIM) bit equal to 1 (SPI serial interface mode selection).

Figure 15. SPI read protocol in 3-wire mode (in mode 3)

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

5.2 MIPI I3C® interface

5.2.1 MIPI I3C® target interface

The LSM6DSK320X interface includes a MIPI I3C® SDR-only target interface (compliant with release 1.1 of the specification) with MIPI I3C® SDR embedded features:

- CCC command
- Direct CCC communication (SET and GET)
- Broadcast CCC communication
- Private communications
- Private read and write for single byte
- Multiple read and write
- In-band interrupt request
- Target reset pattern
- Group address
- Full range VDDIO support
- Asynchronous modes 0 and 1
- Synchronous mode
- Error detection and recovery methods (S0-S6)

In order to disable the MIPI I3C® block, I2C_I3C_disable = 1 must be written in IF_CFG (03h).

5.2.2 MIPI I3C® CCC supported commands

The list of MIPI I3C® CCC commands supported by the device is detailed in the following table.

Table 17. MIPI I3C® CCC commands

Command	Command code	Default	Description
ENTDAA	0x07		DAA procedure
SETDASA	0x87		Assign dynamic address using static address 0x6B/0x6A depending on SDO pin

5.2.3 Overview of antispikes filter management

The device acts as a standard I²C target as long as it has an I²C static address. The device is capable of detecting and disabling the I²C antispikes filter after detecting the broadcast address (7'h7E/W). In order to guarantee proper behavior of the device, the I3C controller must emit the first START, 7'h7E/W at open-drain speed using I²C fast mode plus reference timing.

After detecting the broadcast address, the device can receive the I3C dynamic address following the I3C push-pull timing. If the device is not assigned a dynamic address, then the device continues to operate as an I²C device with no antispikes filter. For the case in which the host decides to keep the device as I²C with an antispikes filter, there is a configuration required to keep the antispikes filter active. This configuration is done by writing the ASF_CTRL bit to 1 in the IF_CFG (03h) register. This configuration forces the antispikes filter to always be turned on instead of being managed by the communication on the bus.

5.3 Auxiliary MIPI I3C[®] target interface

The LSM6DSK320X interface includes an auxiliary MIPI I3C[®] SDR-only target interface (compliant with release 1.1 of the specification) with MIPI I3C[®] SDR embedded features:

- CCC command
- Direct CCC communication (SET and GET)
- Broadcast CCC communication
- Private communications
- Private read and write for single byte
- Multiple read and write
- In-band interrupt request
- Target reset pattern (peripheral reset only)
- Group address
- Full range VDDIO support
- Error detection and recovery methods (S0-S6)

In order to disable the MIPI I3C[®] auxiliary block, IF2_SPI_READ_EN = 1 must be written in IF2_CTRL1_OIS (70h).

Table 18. MIPI I3C[®] CCC commands

Command	Command code	Default	Description

5.4 Auxiliary SPI interface

If the LSM6DSK320X is configured in mode 3, the auxiliary SPI is available. The auxiliary SPI interface is mapped to the following dedicated pins.

Table 19. Auxiliary SPI pin details

Pin name	Pin description
OCS_aux	Enables auxiliary SPI 3/4-wire
SDx	Auxiliary SPI 3/4-wire data input (SDI_aux) and SPI 3-wire data output (SDO_aux)
SCx	Auxiliary SPI 3/4-wire interface serial port clock
SDO_aux	Auxiliary SPI 4-wire data output (SDO_aux)

When the LSM6DSK320X is configured in mode 3, the auxiliary SPI can be connected to a camera module for OIS support.

5.5 I²C controller interface

If the LSM6DSK320X is configured in mode 2, an I²C controller line is available. The controller serial interface is mapped to the following dedicated pins.

Table 20. I²C controller pin details

Pin name	Pin description
CSCL	I ² C controller serial clock
CSDA	I ² C controller serial data
CDRDY	I ² C controller external synchronization signal

6 Functionality

This section describes all the operating modes and power modes of the LSM6DSK320X.

Note: Refer to the product application note for the details regarding operating/power mode configurations, settings, turn-on/off time and on-the-fly changes.

6.1 Operating modes

In the LSM6DSK320X, the low-*g*, high-*g* accelerometers and the gyroscope can be turned on/off independently of each other and are allowed to have different ODRs and power modes.

6.1.1 Low-*g* accelerometer operating modes

In the LSM6DSK320X, the accelerometer can be configured in six different operating modes: power-down mode, low-power mode (1, 2, 3), normal mode, high-performance mode, high-accuracy ODR mode, and ODR-triggered mode.

The operating mode selected depends on the value of the OP_MODE_XL[2:0] bits in CTRL1 (10h).

If the value of the OP_MODE_XL[2:0] bits is 000 (default), high-performance mode is valid for all ODRs (from 7.5 Hz up to 7.68 kHz).

Normal mode is available for ODR values from 7.5 Hz to 1.92 kHz and it is enabled by setting the OP_MODE_XL[2:0] bits to 111. Normal mode cannot be used in mode 3 connection mode.

In high-performance mode and in normal mode, the analog antialiasing filter is active.

Low-power mode is available for lower ODRs (1.875 Hz, 15 Hz, 30 Hz, 60 Hz, 120 Hz, 240 Hz). The three low-power modes are enabled by setting OP_MODE_XL[2:0] to 100 (LPM1), 101 (LPM2), 110 (LPM3).

High-accuracy ODR mode is available for ODR values from 15 Hz up to 7.68 kHz and it is enabled by setting the OP_MODE_XL[2:0] bits to 001. Refer to [Section 6.1.4: High-accuracy ODR mode](#) for more details.

ODR-triggered mode is available for ODR values from 15 Hz up to 7.68 kHz and it is enabled by setting the OP_MODE_XL[2:0] bits to 011. Refer to [Section 6.1.5: ODR-triggered mode](#) for more details.

The embedded functions based on accelerometer data (free-fall, 6D/4D, tap/double-tap, wake-up, activity/inactivity, stationary/motion, step counter, step detection, significant motion, tilt) and the FIFO batching functionality are supported in all modes.

6.1.2 High-*g* accelerometer operating modes

In the LSM6DSK320X, the high-*g* accelerometer can be configured with different ODRs from 480 Hz up to 7.68 kHz.

When the high-*g* accelerometer is used, the low-*g* accelerometer must be configured in high-performance mode or in high-accuracy ODR mode. In these configurations, antialiasing is enabled. The ODRs are independent between the low-*g* and high-*g* accelerometers.

There are no limitations on the selectable operating mode of the gyroscope when the high-*g* channel is enabled.

Table 21. High-*g* accelerometer compatibility with low-*g* accelerometer operating modes and ODRs

Low- <i>g</i> accelerometer modes	Low- <i>g</i> accelerometer ODR_XL	High- <i>g</i> compatibility
High-performance	All	Y
High-accuracy ODR	All	Y
Low-power	All	N
Normal mode	All	N
ODR-triggered	All	N

6.1.3 Gyroscope operating modes

In the LSM6DSK320X, the gyroscope can be configured in six different operating modes: power-down mode, sleep mode, low-power mode, high-performance mode, high-accuracy ODR mode, and ODR-triggered mode.

The operating mode selected depends on the value of the OP_MODE_G_[2:0] bits in CTRL2 (11h).

If the value of the OP_MODE_G_[2:0] bits is 000 (default), high-performance mode is valid for all ODRs (from 7.5 Hz up to 7.68 kHz).

Low-power mode is available for lower ODRs (7.5 Hz, 15 Hz, 30 Hz, 60 Hz, 120 Hz, 240 Hz) and it is enabled by setting the OP_MODE_G_[2:0] bits to 101.

High-accuracy ODR mode is available for ODR values from 15 Hz up to 7.68 kHz and it is enabled by setting the OP_MODE_G_[2:0] bits to 001. Refer to [Section 6.1.4: High-accuracy ODR mode](#) for more details.

ODR-triggered mode is available for ODR values from 15 Hz up to 7.68 kHz and it is enabled by setting the OP_MODE_XL_[2:0] bits to 011. Refer to [Section 6.1.5: ODR-triggered mode](#) for more details

6.1.4 High-accuracy ODR mode

High-accuracy ODR (HAODR) mode can be enabled to reduce the part-to-part output data rate variation. It supports both the low-*g*, high-*g* accelerometers and the gyroscope. When this mode is used for one sensor (accelerometers or gyroscope), the other sensor also has to be configured in high-accuracy ODR (HAODR) mode.

The main high-accuracy ODR features are:

- Noise level is aligned with high-performance mode
- The power consumption in HAODR mode depends on the selected ODR and on the enabled sensors. As an example, at ODR = 960 Hz in combo mode (low-*g* accelerometer + gyroscope) it increases 20 μ A (typical) compared to high-performance mode. Refer to the application note for more details.
- The UI channel bandwidth can be selected through the gyroscope LPF1 and accelerometer HPF/LPF2 filters.
- When HAODR mode is enabled, it is applied to the UI low-*g*, high-*g* accelerometers, UI gyroscope, EIS gyroscope, and temperature. It is not applied to the OIS accelerometer/gyroscope channels.

Note: HAODR mode has to be enabled / disabled when the device is in power-down mode.

When HAODR mode is enabled, four different sets of ODRs are supported based on the configuration of the HAODR_SEL_[1:0] bitfield in the HAODR_CFG (62h) register, as shown in the table below.

Note: High-accuracy ODR mode is not compatible with the activity/inactivity functionality (motion/stationary can be used).

1100	7680	8000	6400	6667
Others	Reserved	Reserved	Reserved	Reserved

6.1.5 ODR-triggered mode

When ODR-triggered mode is enabled, a reference signal must be provided to the INT2 pin, and the device then automatically aligns (in frequency and phase) the data generation to the edges of the reference signal.

It supports the low-*g* accelerometer only, gyroscope only, and the combo of low-*g* accelerometer and gyroscope. When both the accelerometer and gyroscope are enabled, the user must configure the same ODR on both the accelerometer and gyroscope. It is not possible to select different ODRs for the accelerometer and gyroscope; if different output data rate values are set, the ODR configured for the gyroscope data is also applied to the accelerometer data.

The full-scale configurations are totally independent between the accelerometer and gyroscope and they can be set in any combination.

Note: ODR-triggered mode has to be enabled / disabled when the device is in power-down mode.

Note: When ODR-triggered mode is enabled, the 1100 configuration of the ODR_XL[3:0] bits in register CTRL1 (10h) and the 1100 configuration of the ODR_G[3:0] bits in register CTRL2 (11h) cannot be used.

Note: ODR-triggered mode is not compatible with the EIS functionality.

6.2 Block diagram of filters

Figure 16. Block diagram of filters

6.2.1 Block diagrams of the low-g accelerometer filters

In the LSM6DSK320X, the filtering chain for the low-g accelerometer is composed of the following:

- Digital filter (LPF1)
- Composite filter

Details of the block diagrams appear in the following figures.

Figure 17. Low-g accelerometer UI chain

Figure 18. Low-g accelerometer composite filter

1. The cutoff value of the LPF1 output is $ODR/2$ when the accelerometer is in high-performance mode, high-accuracy ODR mode, or normal mode. This value is equal to 2300 Hz when the accelerometer is in low-power mode 1 (2 mean), 912 Hz in low-power mode 2 (4 mean) or 431 Hz in low-power mode 3 (8 mean).

Note: Embedded functions include finite state machine, machine learning core, pedometer, step detector and step counter, significant motion detection, and tilt functions.

The accelerometer filtering chain when mode 3 is enabled is illustrated in the following figure.

Figure 19. Accelerometer chain with mode 3 enabled

Note: The accelerometer OIS chain is enabled by setting the `OIS_XL_EN` bit to 1 in the `UI_CTRL1_OIS` (70h) / `IF2_CTRL1_OIS` (70h) register.

The configuration of the accelerometer UI chain is not affected by enabling/disabling the accelerometer OIS chain, with one exception: accelerometer normal operating mode (`OP_MODE_XL[2:0] = 111` in the `CTRL1` (10h) register) cannot be used when the accelerometer OIS chain is enabled.

Accelerometer output values are available in the following registers with ODR at 7.68 kHz:

- `UI_OUTX_L_A_OIS_HG` (34h) and `UI_OUTX_H_A_OIS_HG` (35h) through `UI_OUTZ_L_A_OIS_HG` (38h) and `UI_OUTZ_H_A_OIS_HG` (39h)
- `IF2_OUTX_L_A_OIS` (28h) and `IF2_OUTX_H_A_OIS` (29h) through `IF2_OUTZ_L_A_OIS` (2Ch) and `IF2_OUTZ_H_A_OIS` (2Dh)

Note: When the accelerometer OIS is used, refer to the product application note for the power mode configuration and settings.

6.2.2 Block diagram of the high-g accelerometer filter

The LSM6DSK320X high-g accelerometer filtering chain is shown in the following figure.

Figure 20. High-g accelerometer filtering chain

6.2.3 Block diagram of the gyroscope filters

In the LSM6DSK320X, the gyroscope filtering chain depends on the mode configuration:

- Mode 1 (for user interface (UI) and electronic image stabilization (EIS) functionality through the primary interface) and mode 2

Figure 21. Gyroscope digital chain - mode 1 (UI/EIS) and mode 2

1. When the gyroscope OIS or EIS chain is enabled, the LPF1 filter is not available in the gyroscope UI chain. It is recommended to avoid using the LPF1 filter in the gyroscope UI chain when the gyroscope OIS or EIS is used.
2. The LPF1 filter is available in high-performance mode only. If the gyroscope is configured in low-power mode, the LPF1 filter is bypassed.

In this configuration, the gyroscope ODR is selectable from 7.5 Hz up to 7.68 kHz. A low-pass filter (LPF1) is available, for more details about the filter characteristics see [Table 66. Gyroscope LPF1 + LPF2 bandwidth selection](#).

The digital LPF2 filter's cutoff frequency depends on the selected gyroscope ODR, as indicated in the following table.

Table 23. Gyroscope LPF2 bandwidth selection

Gyroscope ODR [Hz]	LPF2 cutoff [Hz]
7.5	3.4
15	6.6
30	13.0
60	24.6
120	49.4
240	96
480	187
960	342
1.92 kHz	491
3.84 kHz	528
7.68 kHz	537

Note: Data can be acquired from the output registers and FIFO over the primary I²C/MIPI I3C[®]/SPI interface.

- Mode 3 (for OIS functionality)

Figure 22. Gyroscope digital chain - mode 3 (OIS)

1. When the gyroscope OIS or EIS chain is enabled, the LPF1 filter is not available in the gyroscope UI chain.
2. It is recommended to avoid using the LPF1 filter in mode 1/2 when the gyroscope OIS or EIS chain is used.
3. When the gyroscope OIS is used, refer to the product application note for the power mode configuration and settings.

The auxiliary interface needs to be enabled in [UI_CTRL1_OIS \(70h\)](#) / [IF2_CTRL1_OIS \(70h\)](#).

In mode 3 configuration, there are two paths:

- The chain for user interface (UI) where the ODR is selectable from 7.5 Hz up to 7.68 kHz
- The chain for OIS where the ODR is at 7.68 kHz and the LPF1 is available. The LPF1 configuration depends on the setting of the LPF1_G_OIS_BW_[1:0] bits in register [UI_CTRL2_OIS \(71h\)](#) / [IF2_CTRL2_OIS \(71h\)](#); for more details about the filter characteristics see [UI_CTRL2_OIS \(71h\)](#). Gyroscope output values are in registers 22h to 27h if read from the auxiliary interfaces or in registers 2Eh to 33h if read from the primary interface with the selected full scale FS_G_OIS_[1:0] bits in [UI_CTRL2_OIS \(71h\)](#) / [IF2_CTRL2_OIS \(71h\)](#).

6.3 Enhanced EIS

The LSM6DSK320X offers advanced design flexibility for EIS applications: enhanced EIS functionality has a dedicated channel and processing with independent filtering.

Enhanced EIS main features:

- Enhanced EIS channel gyroscope data can be read over the primary interfaces through I²C / MIPI I3C[®] / SPI.
- EIS data are available in free-run mode in the output registers (UI_OUTX_L_G_OIS_EIS (2Eh) and UI_OUTX_H_G_OIS_EIS (2Fh) through UI_OUTZ_L_G_OIS_EIS (32h) and UI_OUTZ_H_G_OIS_EIS (33h)) by setting the G_EIS_ON_G_OIS_OUT_REG bit to 1 in the CTRL_EIS (6Bh) register or in FIFO (by setting the G_EIS_FIFO_EN bit to 1 in the FIFO_CTRL4 (0Ah) register) with dedicated TAG and timestamp configurable using FIFO_CTRL4 (0Ah).
- Enhanced EIS option is compatible with mode 3 selection. When EIS data-out are read from the output registers (setting G_EIS_ON_G_OIS_OUT_REG bit), data from the gyroscope OIS chain can be only read from the auxiliary interfaces.

Figure 23. LSM6DSK320X supports UI, enhanced EIS, and OIS processing simultaneously

Figure 24. Gyroscope enhanced EIS and UI block diagram

When enhanced EIS mode is activated through the ODR_EIS_[1:0] bits in the CTRL_EIS (6Bh) register:

- Gyroscope UI can be configured only in power-down mode, high-performance mode, or high-accuracy ODR mode.
- Gyroscope EIS full scale can be selected by using the FS_G_EIS_[2:0] bits in the CTRL_EIS (6Bh) register.
- Gyroscope EIS data rate selectable at 1.92 kHz or 960 Hz configurable through the ODR_G_EIS_[1:0] bits in the CTRL_EIS (6Bh) register.
- LPF_EIS low-pass filter (refer to Figure 24) bandwidth selection can be configured through the LPF_G_EIS_BW bit in the CTRL_EIS (6Bh) register.

6.4 OIS

This section describes OIS functionality. There is a dedicated gyroscope and accelerometer DSP for OIS. The device also supports self-test functionality on the OIS side.

6.4.1 Enabling OIS functionality and configuration options

There are two different ways in order to enable and configure the OIS functionality:

- **Auxiliary interface full control:** enabling and configuration done from the auxiliary SPI / MIPI I3C®
- **Primary interface full control:** enabling and configuration done from the primary interface

The configurations that allow selecting these two different options are done using the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register as described in the following table.

Table 24. OIS configurations

OIS_CTRL_FROM_UI	OIS configuration option
0	Auxiliary SPI / auxiliary MIPI I3C® full control
1	Primary interface full control

6.4.1.1 Auxiliary SPI and auxiliary MIPI I3C® full control

This is the default condition of the device. The camera module is completely independent from the application processor as shown in Figure 25.

The auxiliary interface can configure OIS functionality through IF2_INT_OIS (6Fh), IF2_CTRL1_OIS (70h), IF2_CTRL2_OIS (71h), IF2_CTRL3_OIS (72h).

By default, writing using the auxiliary SPI and writing/reading over the I3C are enabled. The IF2_SPI_READ_EN bit in the IF2_CTRL1_OIS (70h) register must be set to 1 to enable reading over the auxiliary SPI. When IF2_SPI_READ_EN is set to 1, the auxiliary I3C target is disabled also.

The primary interface can access the OIS control registers (UI_INT_OIS (6Fh), UI_CTRL1_OIS (70h), UI_CTRL2_OIS (71h), UI_CTRL3_OIS (72h)) in read mode.

Figure 25. Auxiliary interface full control

6.4.1.2 Primary interface full control

This option allows the application processor to configure all OIS functionalities from the primary interface. This option allows using embedded OIS data for both the main and front camera, connecting them to the application processor (eventually adding a context hub) as shown in Figure 26: the AP can also process the data before sending them to the cameras.

In order to place the device in this mode, the `OIS_CTRL_FROM_UI` bit in the `FUNC_CFG_ACCESS` (01h) register must be set to 1 from the primary interface.

Figure 26. OIS primary interface full control

Then, the AP can configure OIS functionalities through `UI_INT_OIS` (6Fh), `UI_CTRL1_OIS` (70h), `UI_CTRL2_OIS` (71h), `UI_CTRL3_OIS` (72h).

By default, writing with the auxiliary SPI and writing/reading over the I3C are enabled. When the auxiliary SPI is used, the `IF2_SPI_READ_EN` bit in the `UI_CTRL1_OIS` (70h) register shall be set to 1. The `IF2_SPI_READ_EN` bit enables reading over the SPI interface and it also disables the auxiliary I3C interface (as shown in Figure 26 (b)). The auxiliary SPI can access the `IF2_INT_OIS` (6Fh), `IF2_CTRL1_OIS` (70h), `IF2_CTRL2_OIS` (71h), and `IF2_CTRL3_OIS` (72h) registers in read-only mode.

Note: The `OIS_CTRL_FROM_UI` bit is reset by the software reset procedure.

6.5 FIFO

The presence of a FIFO allows consistent power saving for the system since the host processor does not need continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

The LSM6DSK320X embeds 1.5 KB of data in FIFO (up to 4.5 KB with the compression feature enabled) to store the following data:

- Gyroscope
- Low-*g* accelerometer
- High-*g* accelerometer
- External sensors (up to four)
- Step counter
- Timestamp
- Temperature
- FSM events
- High-*g* accelerometer peak value
- MLC features, filters, and results
- SFLP output data (quaternion, gyroscope bias, gravity vector)

The applications have maximum flexibility in choosing the rate of batching for physical sensors with FIFO-dedicated configurations: low-*g* accelerometer, gyroscope, and temperature sensor batch rates can be selected by the user. Writing external sensors in the FIFO can be triggered depending on the sensor hub rate chosen or by an external sensor interrupt. The step counter can be stored in the FIFO with an associated timestamp each time a step is detected. The status of the FSMs when they are generating an interrupt event can be stored in the FIFO, as well as the long counter overrun event or the long counter value when a specific command is executed from one FSM, all associated with the timestamp value. The high-*g* accelerometer peak value detected from the high-*g* peak tracking feature is stored in FIFO. Results from SFLP (quaternion, gyroscope bias, gravity vector) can be stored in the FIFO at the rate selected for the algorithm. Moreover, MLC features, filters, and results can be enabled to be stored in the FIFO. It is possible to select decimation for timestamp batching in FIFO with a factor of 1, 8, or 32.

The reconstruction of a FIFO stream is a simple task thanks to the FIFO_DATA_OUT_TAG byte that allows recognizing the meaning of a word in FIFO.

FIFO allows correct reconstruction of the timestamp information for each sensor stored in FIFO. If a change in the ODR or BDR (batch data rate) configuration is performed, the application can correctly reconstruct the timestamp and know exactly when the change was applied without disabling FIFO batching. FIFO stores information of the new configuration and timestamp in which the change was applied in the device.

Finally, FIFO embeds a compression algorithm that the user can enable in order to have up to 4.5 KB data stored in FIFO and take advantage of interface communication length for FIFO flushing and communication power consumption.

The programmable FIFO watermark threshold can be set using the WTM[7:0] bits in the FIFO_CTRL1 (07h) register. To monitor the FIFO status, dedicated registers (FIFO_STATUS1 (1Bh), FIFO_STATUS2 (1Ch)) can be read to detect FIFO overrun events, FIFO full status, FIFO empty status, FIFO watermark status, and the number of unread samples stored in the FIFO. To generate dedicated interrupts on the INT1 and INT2 pins of these status events, the configuration can be set in INT1_CTRL (0Dh) and INT2_CTRL (0Eh).

The FIFO buffer can be configured according to seven different modes:

- Bypass mode
- FIFO mode
- Continuous mode
- Continuous-to-FIFO mode
- ContinuousWTM-to-full mode
- Bypass-to-continuous mode
- Bypass-to-FIFO mode

Each mode is selected by the FIFO_MODE_[2:0] bits in the FIFO_CTRL4 (0Ah) register.

6.5.1 Bypass mode

In bypass mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]** = 000), the FIFO is not operational and it remains empty. Bypass mode is also used to reset the FIFO when in FIFO mode.

6.5.2 FIFO mode

In FIFO mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]** = 001) data from the output channels are stored in the FIFO until it is full.

To reset FIFO content, bypass mode should be selected by writing **FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]**) to 000. After this reset command, it is possible to restart FIFO mode by writing **FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]**) to 001.

The FIFO buffer memorizes up to 4.5 KB of data (with compression enabled) but the depth of the FIFO can be resized by setting the **WTM[7:0]** bits in **FIFO_CTRL1 (07h)**. If the **STOP_ON_WTM** bit in **FIFO_CTRL2 (08h)** is set to 1, FIFO depth is limited up to the **WTM[7:0]** bits in the **FIFO_CTRL1 (07h)** register.

6.5.3 Continuous mode

Continuous mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]** = 110) provides a continuous FIFO update: as new data arrives, the older data is discarded.

A FIFO threshold flag **FIFO_STATUS2 (1Ch)**(**FIFO_WTM_IA**) is asserted when the number of unread samples in FIFO is greater than or equal to **FIFO_CTRL1 (07h)** (**WTM[7:0]**).

It is possible to route the **FIFO_WTM_IA** flag to the **INT1** pin by writing in register **INT1_CTRL (0Dh)** (**INT1_FIFO_TH**) = 1 or to the **INT2** pin by writing in register **INT2_CTRL (0Eh)**(**INT2_FIFO_TH**) = 1.

A full-flag interrupt can be enabled, **INT1_CTRL (0Dh)**(**INT1_FIFO_FULL**) = 1 or **INT2_CTRL (0Eh)**(**INT2_FIFO_FULL**) = 1, in order to indicate FIFO saturation and eventually read its content all at once.

If an overrun occurs, at least one of the oldest samples in FIFO has been overwritten and the **FIFO_OVR_IA** flag in **FIFO_STATUS2 (1Ch)** is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in **FIFO_STATUS1 (1Bh)** and **FIFO_STATUS2 (1Ch)**(**DIFF_FIFO_[8:0]**).

6.5.4 Continuous-to-FIFO mode

In continuous-to-FIFO mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]** = 011), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- High-g wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 1, FIFO operates in FIFO mode.

When the selected trigger bit is equal to 0, FIFO operates in continuous mode.

6.5.5 ContinuousWTM-to-full mode

In continuousWTM-to-full mode (**FIFO_CTRL4 (0Ah)**(**FIFO_MODE_[2:0]** = 010), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- High-g wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 0, FIFO operates in continuous mode with the FIFO size limited to the FIFO watermark level (defined by the **WTM[7:0]** bits in the **FIFO_CTRL1 (07h)** register).

When the selected trigger bit is equal to 1, FIFO continues to store data until it is full.

6.5.6 Bypass-to-continuous mode

In bypass-to-continuous mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 100), data measurement storage inside FIFO operates in continuous mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- High-*g* wake-up
- Free-fall
- D6D

6.5.7 Bypass-to-FIFO mode

In bypass-to-FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 111), data measurement storage inside FIFO operates in FIFO mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- High-*g* wake-up
- Free-fall
- D6D

6.5.8 FIFO reading procedure

The data stored in FIFO are accessible from dedicated registers and each FIFO word is composed of 7 bytes: one tag byte ([FIFO_DATA_OUT_TAG \(78h\)](#)), in order to identify the sensor, and 6 bytes of fixed data ([FIFO_DATA_OUT](#) registers from (79h) to (7Eh)).

The [DIFF_FIFO_\[8:0\]](#) field in the [FIFO_STATUS1 \(1Bh\)](#) and [FIFO_STATUS2 \(1Ch\)](#) registers contains the number of words (1 byte TAG + 6 bytes DATA) collected in FIFO.

In addition, it is possible to configure a counter of the batch events of accelerometer or gyroscope sensors. The flag [COUNTER_BDR_IA](#) in [FIFO_STATUS2 \(1Ch\)](#) alerts that the counter reaches a selectable threshold ([CNT_BDR_TH_\[9:0\]](#) field in [COUNTER_BDR_REG1 \(0Bh\)](#) and [COUNTER_BDR_REG2 \(0Ch\)](#)). This allows triggering the reading of FIFO with the desired latency of one single sensor. The sensor is selectable using the [TRIG_COUNTER_BDR_\[1:0\]](#) bits in [COUNTER_BDR_REG1 \(0Bh\)](#). As for the other FIFO status events, the flag [COUNTER_BDR_IA](#) can be routed on the INT1 or INT2 pins by asserting the corresponding bits ([INT1_CNT_BDR](#) of [INT1_CTRL \(0Dh\)](#) and [INT2_CNT_BDR](#) of [INT2_CTRL \(0Eh\)](#)).

In order to maximize the amount of accelerometer and gyroscope data in FIFO, the user can enable the compression algorithm by setting to 1 both the [FIFO_COMPR_EN](#) bit in [EMB_FUNC_EN_B \(05h\)](#) (embedded functions registers bank) and the [FIFO_COMPR_RT_EN](#) bit in [FIFO_CTRL2 \(08h\)](#). When compression is enabled, it is also possible to force writing noncompressed data at a selectable rate using the [UNCOMPR_RATE_\[1:0\]](#) field in [FIFO_CTRL2 \(08h\)](#).

Meta information about accelerometer and gyroscope sensor configuration changes can be managed by enabling the [ODR_CHG_EN](#) bit in [FIFO_CTRL2 \(08h\)](#).

1. Mode 3 - SPI is enabled when the IF2_SPI_READ_EN bit in the UI_CTRL1_OIS (70h) / IF2_CTRL1_OIS (70h) registers is set to 1.

The internal pull-up value is from 30 kΩ to 50 kΩ, depending on VDDIO.

8 Register mapping

The table given below provides a list of the 8/16-bit registers embedded in the device and the corresponding addresses.

All these registers are accessible from the primary SPI/I²C/MIPI I3C[®] interface only.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

9 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate, and temperature data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

9.1 FUNC_CFG_ACCESS (01h)

Enable embedded functions register (R/W)

Table 27. FUNC_CFG_ACCESS register

EMB_FUNC_REG_ACCESS	SHUB_REG_ACCESS	0 ⁽¹⁾	0 ⁽¹⁾	FSM_WR_CTRL_EN	SW_POR	IF2_RESET	OIS_CTRL_FROM_UI
---------------------	-----------------	------------------	------------------	----------------	--------	-----------	------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 28. FUNC_CFG_ACCESS register description

EMB_FUNC_REG_ACCESS	Enables access to the embedded functions configuration registers. ⁽¹⁾ Default value: 0
SHUB_REG_ACCESS	Enables access to the sensor hub (I ² C controller) configuration registers. ⁽²⁾ Default value: 0
FSM_WR_CTRL_EN	Enables the control of the CTRL registers to FSM (FSM can change some configurations of the device autonomously). Default value: 0 (0: disabled; 1: enabled)
SW_POR	Global reset of the device. Default value: 0
IF2_RESET	Resets the control registers of the auxiliary interface from the primary interface. This bit must be set to 1 and then back to 0 (this bit is not automatically cleared). Default value: 0
OIS_CTRL_FROM_UI	Enables the full control of OIS configurations from the primary interface. Default value: 0 (0: OIS chain full control from primary interface disabled; 1: OIS chain full control from primary interface enabled)

1. Details concerning the embedded functions configuration registers are available in [Section 12: Embedded functions register mapping](#) and [Section 13: Embedded functions register description](#).
2. Details concerning the sensor hub registers are available in [Section 16: Sensor hub register mapping](#) and [Section 17: Sensor hub register description](#).

9.2 PIN_CTRL (02h)

SDO, OCS_aux, SDO_aux pins pull-up register (R/W). This register is not reset during the software reset procedure (see bit 0 of the CTRL3 (12h) register).

Table 29. PIN_CTRL register

------------	-----------	-------------	------------------	------------------	------------------	-------------------	-------------------

1. This bit must be set to 0 for the correct operation of the device.

Table 30. PIN_CTRL register description

OIS_PU_DIS	Disables pull-up on both OCS_aux and SDO_aux pins (for mode 1 and mode 2). For further details about the configuration of the pull-up resistors in mode 3, refer to Table 25. Default value: 0 (0: OCS_aux and SDO_aux pins with pull-up; 1: OCS_aux and SDO_aux pins pull-up disconnected)
SDO_PU_EN	Enables pull-up on SDO pin. For details, refer to Table 25. Default value: 0 (0: SDO pin pull-up disconnected; 1: SDO pin with pull-up)
IBHR_POR_EN	Selects the action that the device performs after "reset whole chip" I3C pattern. Default value: 1 (0: configuration reset (software reset + dynamic address reset); 1: global reset (POR reset))
IO_PAD_STRENGTH[1:0]	Defines the drive strength for the interrupt pads. Default value: 11 (00: lowest strength (recommended for VDDIO ≥ 3.0 V); 01: intermediate strength (recommended for VDDIO ≥ 2.0 V and VDDIO < 3 V); 10: reserved (do not use); 11: highest strength (recommended for VDDIO < 2 V))

9.3 IF_CFG (03h)

Interface configuration register (R/W). This register is not reset during the software reset procedure (see bit 0 of the CTRL3 (12h) register).

Table 31. IF_CFG register

1. This bit must be set to 0 for the correct operation of the device.

Table 32. IF_CFG register description

SDA_PU_EN	Enables pull-up on SDA pin. Default value: 0 (0: SDA pin pull-up disconnected; 1: SDA pin with pull-up)
SHUB_PU_EN	Enables I ² C controller pull-up. Default value: 0 (0: internal pull-up on auxiliary I ² C line disabled; 1: internal pull-up on auxiliary I ² C line enabled)
ASF_CTRL	Enables antispikes filters. Default value: 0 (0: antispikes filters are managed by the protocol and turned off after the broadcast address; 1: antispikes filters on SCL and SDA lines are always enabled)
H_LACTIVE	Interrupt activation level. Default value: 0 (0: interrupt output pins active high; 1: interrupt output pins active low)
PP_OD	Push-pull/open-drain selection on INT1 and INT2 pins. Default value: 0 (0: push-pull mode; 1: open-drain mode)
SIM	SPI serial interface mode selection. Default value: 0 (0: 4-wire interface; 1: 3-wire interface)
I2C_I3C_disable	Disables I ² C and MIPI I3C [®] interfaces. Default value: 0 (0: SPI, I ² C and MIPI I3C [®] interfaces enabled; 1: I ² C and MIPI I3C [®] interfaces disabled)

1. This bit must be set to 0 for the correct operation of the device.

Table 38. FIFO_CTRL2 register description

STOP_ON_WTM	Sensing chain FIFO stop values memorization at threshold level. Default value: 0 (0: FIFO depth is not limited; 1: FIFO depth is limited to threshold level, defined in FIFO_CTRL1 (07h))
FIFO_COMPR_RT_EN ⁽¹⁾	Enables/disables compression algorithm runtime. Default value: 0 (0: FIFO compression algorithm disabled; 1: FIFO compression algorithm enabled)
ODR_CHG_EN	Enables ODR CHANGE virtual sensor to be batched in FIFO. Default value: 0 (0: ODR CHANGE virtual sensor not batched in FIFO; 1: ODR CHANGE virtual sensor batched in FIFO) <i>Note: Refer to the product application note for the details regarding operating/power mode configurations, settings, turn-on/off time and on-the-fly changes.</i>
UNCOMPR_RATE_[1:0]	This field configures the compression algorithm to write uncompressed data at each rate. (0: uncompressed data writing is not forced (default); 1: uncompressed data every 8 batch data rate; 2: uncompressed data every 16 batch data rate; 3: uncompressed data every 32 batch data rate)

1. This bit is activated if the FIFO_COMPR_EN bit of [EMB_FUNC_EN_B \(05h\)](#) is set to 1.

9.11 INT1_CTRL (0Dh)

INT1 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT1 when the MIPI I3C[®] dynamic address is not assigned (I²C or SPI is used). Some bits can be also used to trigger an IBI (in-band interrupt) when the MIPI I3C[®] interface is used. The output of the pin is the OR combination of the signals selected here and in MD1_CFG (5Eh).

FIFO_WTM_IA	FIFO watermark status. Default value: 0 (0: FIFO filling is lower than WTM; 1: FIFO filling is equal to or greater than WTM) Watermark is set through bits WTM[7:0] in FIFO_CTRL2 (08h) and FIFO_CTRL1 (07h) .
FIFO_OVR_IA	FIFO overrun status. Default value: 0 (0: FIFO is not completely filled; 1: FIFO is completely filled)
FIFO_FULL_IA	Smart FIFO full status. Default value: 0 (0: FIFO is not full; 1: FIFO will be full at the next ODR)
COUNTER_BDR_IA	Counter BDR reaches the CNT_BDR_TH_[10:0] threshold set in COUNTER_BDR_REG1 (0Bh) and COUNTER_BDR_REG2 (0Ch) . Default value: 0 This bit is reset when these registers are read.
FIFO_OVR_LATCHED	Latched FIFO overrun status. Default value: 0 This bit is reset when this register is read.
DIFF_FIFO_8	Number of unread sensor data (TAG + 6 bytes) stored in FIFO. Default value: 00 In conjunction with DIFF_FIFO[7:0] in FIFO_STATUS1 (1Bh)

1. This bit must be set to 0 for the correct operation of the device.

Table 155. FUNCTIONS_ENABLE register description

INTERRUPTS_ENABLE	Enables basic interrupts (6D/4D, free-fall, wake-up, tap, activity/inactivity). Default value: 0 (0: interrupt disabled; 1: interrupt enabled)
TIMESTAMP_EN	Enables timestamp counter. The counter is readable in TIMESTAMP0 (40h) , TIMESTAMP1 (41h) , TIMESTAMP2 (42h) , and TIMESTAMP3 (43h) . Default value: 0 (0: disabled; 1: enabled)
DIS_RST_LIR_ALL_INT	When this bit is set to 1, reading the ALL_INT_SRC (1Dh) register does not reset the latched interrupt signals. This can be useful in order to not reset some status flags before reading the corresponding status register. Default value: 0 (0: disabled; 1: enabled)
INACT_EN_[1:0]	Enables activity/inactivity (sleep) function. Default value: 00 (00: stationary/motion-only interrupts generated, accelerometer and gyroscope configuration do not change; 01: sets accelerometer to low-power mode 1 with accelerometer ODR selected through the XL_INACT_ODR_[1:0] bits of the INACTIVITY_DUR (54h) register, gyroscope configuration does not change; 10: sets accelerometer to low-power mode 1 with accelerometer ODR selected through the XL_INACT_ODR_[1:0] bits of the INACTIVITY_DUR (54h) register, gyroscope in sleep mode; 11: sets accelerometer to low-power mode 1 with accelerometer ODR selected through the XL_INACT_ODR_[1:0] bits of the INACTIVITY_DUR (54h) register, gyroscope in power-down mode)

Table 157. HG_FUNCTIONS_ENABLE register description

HG_INTERRUPTS_ENABLE	Enables high-g interrupt generator (high-g wake-up and high-g shock). Default value: 0 (0: interrupt disabled; 1: interrupt enabled)
HG_WU_CHANGE_INT_SEL	Selects the type of wake-up interrupt to be sent to the INT1 pin, INT2 pin, and described by the HG_IA bit (ALL_INT_SRC (1Dh)). Default value: 0 (0: interrupt generated each time one of the three axes is higher than the threshold; 1: interrupt when high-g passes from all axes under the threshold to at least one axis over the threshold, or vice versa.)
INT2_HG_WU	Routes high-g wake-up event to INT2. Default value: 0 (0: routing high-g wake-up event to INT2 disabled; 1: routing high-g wake-up event to INT2 enabled)
INT1_HG_WU	Routes high-g wake-up event to INT1. Default value: 0 (0: routing high-g wake-up event to INT1 disabled; 1: routing high-g wake-up event to INT1 enabled)
HG_SHOCK_DUR[3:0]	High-g duration to exit from shock state. Allowed values for HG_SHOCK_DUR[3:0] are in the range of 0 (default) to 14. $HG_SHOCK_DUR[s] = (HG_SHOCK_DUR[3:0] + 1) * 512 / ODR_XL_HG$

Table 175. TAP_DUR register description

DUR_[3:0]	Duration of maximum time gap for double-tap recognition. Default: 0000 When double-tap recognition is enabled, this register expresses the maximum time between two consecutive detected taps to determine a double-tap event. The default value of these bits is 0000b which corresponds to 16/ODR_XL time. If the DUR_[3:0] bits are set to a different value, 1LSB corresponds to 32/ODR_XL time.
QUIET_[1:0]	Expected quiet time after a tap detection. Default value: 00 Quiet time is the time after the first detected tap in which there must not be any overthreshold event. The default value of these bits is 00b which corresponds to 2/ODR_XL time. If the QUIET_[1:0] bits are set to a different value, 1LSB corresponds to 4/ODR_XL time.
SHOCK_[1:0]	Maximum duration of overthreshold event. Default value: 00 Maximum duration is the maximum time of an overthreshold signal detection to be recognized as a tap event. The default value of these bits is 00b which corresponds to 4/ODR_XL time. If the SHOCK_[1:0] bits are set to a different value, 1LSB corresponds to 8/ODR_XL time.

1. This bit must be set to 0 for the correct operation of the device.

Table 192. UI_HANDSHAKE_CTRL register description

UI_SHARED_ACK	Primary interface side. This bit acknowledges the handshake. If the secondary interface is not accessing the shared registers, this bit is set to 1 by the device and the R/W operation on the UI_IF2_SHARED_0 (65h) through UI_IF2_SHARED_5 (6Ah) registers is allowed on the primary interface.
UI_SHARED_REQ	This bit is used by the primary interface controller to request access to the UI_IF2_SHARED_0 (65h) through UI_IF2_SHARED_5 (6Ah) registers. When the R/W operation is finished, the controller must reset this bit.

1. This bit must be set to 0 for the correct operation of the device.

Table 265. IF2_HANDSHAKE_CTRL register description

IF2_SHARED_REQ	This bit is used by the auxiliary SPI (IF2) controller interface to request access to the UI_IF2_SHARED_0 (65h) through UI_IF2_SHARED_5 (6Ah) registers. When the R/W operation is finished, the controller must reset this bit.
IF2_SHARED_ACK	Auxiliary SPI (IF2) interface side. This bit acknowledges the handshake. If the primary interface is not accessing the shared registers, this bit is set to 1 by the device and the R/W operation on the UI_IF2_SHARED_0 (65h) through UI_IF2_SHARED_5 (6Ah) registers is allowed on the auxiliary SPI interface.

11.11 IF2_INT_OIS (6Fh)

OIS interrupt configuration register and self-test setting

The auxiliary interface can write this register when the OIS_CTRL_FROM_UI bit in the FUNC_CFG_ACCESS (01h) register is equal to 0 (auxiliary IF full-control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 1 (primary IF full-control mode) and shows the content of the UI_INT_OIS (6Fh) register.

INT2_DRDY_OIS	Enables OIS chain DRDY on INT2 pin. This setting has priority over all other INT2 settings.
DRDY_MASK_OIS	Enables / masks OIS data available. Default value: 0 (0: disabled; 1: masks OIS DRDY on pin (both accelerometer and gyroscope) until filter settling ends (accelerometer and gyroscope independently masked))
ST_OIS_CLAMPDIS	Disables OIS chain clamp during self-test. Default value: 0 (0: All OIS chain outputs = 8000h during self-test; 1: OIS chain self-test outputs)
ST_G_OIS_[1:0]	Gyroscope OIS chain self-test selection when the self-test is enabled and ST_OIS_CLAMPDIS = 0. (00: normal mode (default); 01: positive sign self-test; 10: normal mode; 11: negative sign self-test)
ST_XL_OIS_[1:0]	Accelerometer OIS chain self-test selection; activated only if the accelerometer OIS chain is enabled. (00: normal mode (default); 01: positive sign self-test; 10: negative sign self-test; 11: reserved)

11.12 IF2_CTRL1_OIS (70h)

OIS configuration register

The auxiliary interface can write this register when the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register is equal to 0 (auxiliary IF full-control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 1 (primary IF full-control mode) and shows the content of the [UI_CTRL1_OIS \(70h\)](#) register.

OIS_G_EN	Enables gyroscope OIS chain. Default value: 0 (0: gyroscope OIS chain disabled; 1: gyroscope OIS chain enabled)
IF2_SPI_READ_EN	Selection between auxiliary SPI or auxiliary I3C. Default value: 0 (0: OIS data read from auxiliary SPI disabled and I3C auxiliary enabled; 1: OIS data read from auxiliary SPI enabled and I3C auxiliary disabled)

11.13 IF2_CTRL2_OIS (71h)

OIS configuration register

The auxiliary interface can write this register when the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register is equal to 0 (auxiliary IF full-control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 1 (primary IF full-control mode) and shows the content of the [UI_CTRL2_OIS \(71h\)](#) register.

FIFO_COMPR_EN ⁽²⁾	Enables FIFO compression function. Default value: 0 (0: FIFO compression function disabled; 1: FIFO compression function enabled)
FSM_EN	Enables finite state machine (FSM) function. Default value: 0 (0: FSM function disabled; 1: FSM function enabled)

1. MLC_BEFORE_FSM_EN bit in the [EMB_FUNC_EN_A \(04h\)](#) register must be set to 0 when using this bit.

2. This bit is activated if the FIFO_COMPR_RT_EN bit of [FIFO_CTRL2 \(08h\)](#) is set to 1.

14 Embedded advanced features pages

The table given below provides a list of the registers for the embedded advanced features page 0. These registers are accessible when PAGE_SEL[3:0] are set to 0000 in [PAGE_SEL \(02h\)](#).

Note: *External sensor offset compensation registers and transformation matrix correction registers affect FSM data only. When these registers are set with their default values, no compensation is applied.*

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Write procedure example: write value 06h in register at address 84h (PEDO_DEB_STEPS_CONF) in page 1

1. Write bit EMB_FUNC_REG_ACCESS = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_WRITE = 1 in PAGE_RW (17h) register // Select write operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Write 06h in PAGE_DATA register (09h) // Set value to be written
6. Write bit PAGE_WRITE = 0 in PAGE_RW (17h) register // Write operation disabled
7. Write bit EMB_FUNC_REG_ACCESS = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Read procedure example: read value of register at address 84h (PEDO_DEB_STEPS_CONF) in page 1

1. Write bit EMB_FUNC_REG_ACCESS = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_READ = 1 in PAGE_RW (17h) register // Select read operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Read value of PAGE_DATA register (09h) // Get register value
6. Write bit PAGE_READ = 0 in PAGE_RW (17h) register // Read operation disabled
7. Write bit EMB_FUNC_REG_ACCESS = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Note: *Steps 1 and 2 of both procedures are intended to be performed at the beginning of the procedure. Steps 6 and 7 of both procedures are intended to be performed at the end of the procedure. If the procedure involves multiple operations, only steps 3, 4 and 5 must be repeated for each operation. If, in particular, the multiple operations involve consecutive registers, only step 5 can be performed.*

15.1 Page 0 - embedded advanced features registers

15.1.1 FSM_EXT_SENSITIVITY_L (BAh) and FSM_EXT_SENSITIVITY_H (BBh)

External sensor sensitivity value register for the finite state machine (R/W)

This register corresponds to the conversion value of the external sensor. The register value is expressed as half-precision floating-point format: SEESEEEEEEEEEEE (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

Default value of FSM_EXT_S_[15:0] bits is 0x1624 (when using an external magnetometer this value corresponds to 0.0015 gauss/LSB).

15.2.1 XL_HG_SENSITIVITY_L (58h) and XL_HG_SENSITIVITY_H (59h)

High-*g* accelerometer sensitivity value register for the finite state machine and machine learning core (R/W)

This register corresponds to the conversion value of the high-*g* accelerometer sensor. The register value is expressed as half-precision floating-point format: S EEEEE FFFF (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

The default value of XL_HG_S[15:0] is 0x051F (expressed in hundreds of *g*, then $7.8e-5 * [100\text{ g}]$). If FS_XL_HG is $\pm 320\text{ g}$, the value to be loaded is 0x06D4 (corresponds to $10.4e-5 * [100\text{ g}]$).

MLC_EXT_SENSITIVITY_L (E8h) and MLC_EXT_SENSITIVITY_H (E9h)

External sensor sensitivity value register for the machine learning core (R/W)

This register corresponds to the conversion value of the external sensor. The register value is expressed as half-precision floating-point format: SEEEEEEEEEEEE (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

Default value of MLC_EXT_S_[15:0] is 0x3C00 (when using an external magnetometer this value corresponds to 1 gauss/LSB).

External sensor (3-byte output data) sensitivity value register for the finite state machine and machine learning core (R/W)

This register corresponds to the conversion value of the external sensor having 3-byte output data. The register value is expressed as half-precision floating-point format: S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

The default value of EXT_3BYTE_S_[15:0] is 0x0C00 (when using an external pressure sensor this value corresponds to 2.441e-04 hPa/LSB).

EXT_3BYTE_OFFSET_XL (06h), EXT_3BYTE_OFFSET_L (07h) and EXT_3BYTE_OFFSET_H (08h)

External sensor (3-byte output data) offset value register for the finite state machine and machine learning core (R/W)

This register corresponds to the offset value applied to external sensor output data (3-byte) before being processed in FSM and MLC. The value is expressed as a 24-bit word in two's complement.

The default value of EXT_3BYTE_OFF_[23:0] is 0x3F5400, which corresponds to 4150272 LSB. This offset is subtracted from the external output data (in LSB) before the sensitivity (configured in the EXT_3BYTE_SENSITIVITY_L (02h) and EXT_3BYTE_SENSITIVITY_H (03h) registers) is internally applied.

1. This bit must be set to 0 for the correct operation of the device.

Table 519. CONTROLLER_CONFIG register description

RST_CONTROLLER_REGS	Resets controller logic and output registers. Must be set to 1 and then set to 0. Default value: 0
WRITE_ONCE	Target 0 write operation is performed only at the first sensor hub cycle. Default value: 0 (0: write operation for each sensor hub cycle; 1: write operation only for the first sensor hub cycle)
START_CONFIG	Sensor hub trigger signal selection. Default value: 0 (0: sensor hub trigger signal is the accelerometer/gyro data-ready; 1: sensor hub trigger signal external from INT2 pin)
PASS_THROUGH_MODE	I ² C interface pass-through. Default value: 0 (0: pass-through disabled; 1: pass-through enabled, primary I ² C line is short-circuited with the sensor hub line)
CONTROLLER_ON	Enables sensor hub I ² C controller. Default: 0 (0: I ² C controller of sensor hub disabled; 1: I ² C controller of sensor hub enabled)
AUX_SENS_ON[1:0]	Number of external sensors to be read by the sensor hub. (00: one sensor (default); 01: two sensors; 10: three sensors; 11: four sensors)

18 Soldering information

The LGA package is compliant with the [ECOPACK](#) and RoHS standard.

It is qualified for soldering heat resistance according to JEDEC J-STD-020.

For land pattern and soldering recommendations, consult technical note [TN0018](#) available on www.st.com.

19 Package information

To meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions, and product status are available at: www.st.com. ECOPACK is an ST trademark.
