Description of STM32H5 HAL and low-layer drivers

Introduction

STM32Cube is an STMicroelectronics original initiative to significantly improve developer productivity by reducing development effort, time and cost. STM32Cube covers the STM32 portfolio.

STM32Cube includes:

- STM32CubeMX, a graphical software configuration tool that allows the generation of C initialization code using graphical wizards.
- A comprehensive embedded software platform, delivered per Series (such as STM32CubeH5 for STM32H5 Series)
  - The STM32Cube HAL, STM32 abstraction layer embedded software ensuring maximized portability across the STM32 portfolio. HAL APIs are available for all peripherals.
  - Low-layer APIs (LL) offering a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. LL APIs are available only for a set of peripherals.
  - A consistent set of middleware components such as Azure® RTOS ThreadX, USBX, and secure manager API.
  - All embedded software utilities, delivered with a full set of examples.

The HAL driver layer provides a simple, generic multi-instance set of APIs (application programming interfaces) to interact with the upper layer (application, libraries and stacks). The HAL driver APIs are split into two categories: generic APIs, which provide common and generic functions for all the STM32 series and extension APIs, which include specific and customized functions for a given line or part number. The HAL drivers include a complete set of ready-to-use APIs that simplify the user application implementation. For example, the communication peripherals contain APIs to initialize and configure the peripheral, manage data transfers in polling mode, handle interrupts or DMA, and manage communication errors. The HAL drivers are feature-oriented instead of IP-oriented. For example, the timer APIs are split into several categories following the IP functions, such as basic timer, capture and pulse width modulation (PWM). The HAL driver layer implements run-time failure detection by checking the input values of all functions. Such dynamic checking enhances the firmware robustness. Run-time detection is also suitable for user application development and debugging.

The LL drivers offer hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities, and provide atomic operations that must be called by following the programming model described in the product line reference manual. As a result, the LL services are not based on standalone processes and do not require any additional memory resources to save their states, counter or data pointers. All operations are performed by changing the content of the associated peripheral registers. Unlike the HAL, LL APIs are not provided for peripherals for which optimized access is not a key feature, or for those requiring heavy software configuration and/or a complex upper-level stack.

The HAL and LL are complementary and cover a wide range of application requirements:

- The HAL offers high-level and feature-oriented APIs with a high-portability level. These hide the MCU and peripheral complexity from the end-user.
- The LL offers low-level APIs at register level, with better optimization but less portability. These require deep knowledge of the MCU and peripheral specifications.

The HAL- and LL-driver source code is developed in Strict ANSI-C, which makes it independent of the development tools. It is checked with the CodeSonar® static analysis tool. It is fully documented.

It is compliant with MISRA C®:2012 standard.

This user manual is structured as follows:

- Overview of HAL drivers
- Overview of low-layer drivers
- Cohabiting of HAL and LL drivers
- Detailed description of each peripheral driver: configuration structures, functions, and how to use the given API to build your application

1 General information

The STM32CubeH5 MCU Package runs on STM32H5 32-bit microcontrollers based on the Arm® Cortex®-M processor with Arm® TrustZone® technology.

Note: Arm and TrustZone are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

2 Acronyms and definitions

Table 1. Acronyms and definitions

Acronym	Definition
ADC	Analog-to-digital converter
AES	Advanced encryption standard
ANSI	American national standards institute
API	Application programming interface
BSP	Board support package
CAN	Controller area network
CMSIS	Cortex microcontroller software interface standard
COMP	Comparator
CORDIC	Trigonometric calculation unit
CPU	Central processing unit
CRC	CRC calculation unit
CRYP	Cryptographic processor
DAC	Digital to analog converter
DCMI	Digital camera interface
DMA	Direct memory access
EXTI	External interrupt/event controller
FDCAN	Flexible data-rate controller area network unit
FLASH	Flash memory
FMAC	Filtering mathematical calculation unit
FMC	Flexible memory controller
GPIO	General purpose I/Os
GTZC	Global TrustZone® controller
GTZC-MPCBB	GTZC block-based memory protection controller
GTZC-MPCWM	GTZC watermark memory protection controller
GTZC-TZIC	TrustZone® illegal access controller
GTZC-TZSC	TrustZone® security controller
HAL	Hardware abstraction layer
HASH	Hash processor
HCD	USB host controller driver
I2C	Inter-integrated circuit
I3C	Improved inter-integrated circuit
I2S	Inter-integrated sound
ICACHE	Instruction cache
IRDA	Infrared data association
IWDG	Independent watchdog
LCD	Liquid crystal display controller
LPTIM	Low-power timer
LPUART	Low-power universal asynchronous receiver/transmitter

Acronym	Definition
MCO	Microcontroller clock output
MDIOS	Management data input/output (MDIO) slave
MMC	MultiMediaCard
MPU	Memory protection unit
MSP	MCU specific package
NAND	NAND Flash memory
NOR	NOR Flash memory
NVIC	Nested vectored interrupt controller
OPAMP	Operational amplifier
OTFDEC	On-the-fly decryption engine
PKA	Public key accelerator
PCD	USB peripheral controller driver
PPP	STM32 peripheral or block
PSSI	Parallel synchronous slave interface
PWR	Power controller
RCC	Reset and clock controller
RNG	Random number generator
RTC	Real-time clock
SAI	Serial audio interface
SAES	Secure advanced encryption standard
SBS	System configuration, boot and security
SD	Secure digital
SDMMC	SD/SDIO/MultiMediaCard card host interface
SMARTCARD	Smartcard IC
SMBUS	System management bus
SPI	Serial peripheral interface
SRAM	SRAM external memory
SysTick	System tick timer
TIM	Advanced-control, general-purpose or basic timer
UART	Universal asynchronous receiver/transmitter
UCPD	USB Type-C® and Power Delivery interface
USART	Universal synchronous receiver/transmitter
VREFBUF	Voltage reference buffer
WWDG	Window watchdog
USB	Universal serial bus
XSPI	Extended SPI interface

3 Overview of HAL drivers

The HAL drivers are designed to offer a rich set of APIs and to interact easily with the application upper layers.

Each driver consists of a set of functions covering the most common peripheral features. The development of each driver is driven by a common API which standardizes the driver structure, the functions and the parameter names.

The HAL drivers include a set of driver modules, each module being linked to a standalone peripheral. However, in some cases, the module is linked to a peripheral functional mode. As an example, several modules exist for the USART peripheral: UART driver module, USART driver module, SMARTCARD driver module and IRDA driver module.

The HAL main features are the following:

- Cross-family portable set of APIs covering the common peripheral features as well as extension APIs in case of specific peripheral features.
- Three API programming models: polling, interrupt and DMA.
- APIs are RTOS compliant:
  - Fully reentrant APIs
  - Systematic usage of timeouts in polling mode
- Support of peripheral multi-instance allowing concurrent API calls for multiple instances of a given peripheral (such as USART1 or USART2)
- All HAL APIs implement user-callback functions mechanism:
  - Peripheral Init/DeInit HAL APIs can call user-callback functions to perform peripheral system level Initialization/De-Initialization (clock, GPIOs, interrupt, DMA)
  - Peripherals interrupt events
  - Error events
- Object locking mechanism: safe hardware access to prevent multiple spurious accesses to shared resources.
- Timeout used for all blocking processes: the timeout can be a simple counter or a timebase.

3.1 HAL and user-application files

3.1.1 HAL driver files

HAL drivers are composed of the following set of files:

Table 2. HAL driver files

File	Description
stm32h5xx_hal_ppp.c	Main peripheral/module driver file It includes the APIs that are common to all STM32 devices. *Example: stm32h5xx_hal_adc.c, stm32h5xx_hal_irda.c.*
stm32h5xx_hal_ppp.h	Header file of the main driver C file It includes common data, handle and enumeration structures, define statements and macros, as well as the exported generic APIs. *Example:stm32h5xx_hal_adc.h,stm32h5xx_hal_irda.h.*
stm32h5xx_hal_ppp_ex.c	Extension file of a peripheral/module driver. It includes the specific APIs for a given part number or family, as well as the newly defined APIs that overwrite the default generic APIs if the internal process is implemented in different way. *Example:stm32h5xx_hal_adc_ex.c,stm32h5xx_hal_flash_ex.c.*
stm32h5xx_hal_ppp_ex.h	Header file of the extension C file It includes the specific data and enumeration structures, define statements and macros, as well as the exported device part number specific APIs *Example: stm32h5xx_hal_adc_ex.h,stm32h5xx_hal_flash_ex.h.*
stm32h5xx_hal.c	This file is used for HAL initialization and contains VREFBUF, SBS, DBGMCU, Remap and Time Delay based on SysTick APIs.
stm32h5xx_hal.h	stm32h5xx_hal.c header file
stm32h5xx_hal_msp_template.c	Template file to be copied to the user application folder It contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
stm32h5xx_hal_conf_template.h	Template file allowing to customize the drivers for a given application
stm32h5xx_hal_def.h	Common HAL resources such as common define statements, enumerations, structures and macros

3.1.2 User-application files

The minimum files required to build an application using the HAL are listed in the table below:

Table 3. User-application files

File	Description
system_stm32h5xx.c	When TrustZone® security is disabled, this file contains SystemInit() that is called at startup just after reset and before branching to the main program. It allows relocating the vector table in internal Flash memory or internal SRAM.
system_stm32h5xx_ns.c	When TrustZone® security is enabled, this file is part of the non-secure application. It contains SystemInit() that is called by the secure application before branching to the non-secure main program. It allows relocating the vector table in internal Flash memory or internal SRAM.
startup_stm32h5xx.s	Toolchain specific file that contains reset handler and exception vectors. For some toolchains, it allows adapting the stack/heap size to fit the application requirements.
stm32h5xx_flash.icf/ stm32h5xx_flash.icf	When TrustZone® security is disabled, this file is the linker file for EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the application requirements.

File	Description
stm32h5xx_flash_s.icf/ stm32h5xx_flash_s.icf	When TrustZone® security is enabled, this file is the linker file for EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the secure application requirements.
stm32h5xx_flash_ns.icf/ stm32h5xx_flash_ns.icf	When TrustZone® security is enabled, this file is the linker file for EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the non-secure application requirements.
stm32h5xx_hal_msp.c	This file contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
stm32h5xx_hal_conf.h	This file allows the user to customize the HAL drivers for a specific application. It is not mandatory to modify this configuration. The application can use the default configuration without any modification.
stm32h5xx_it.c/.h	This file contains the exceptions handler and peripherals interrupt service routine, and calls HAL_IncTick() at regular time intervals to increment a local variable (declared in *stm32h5xx*_hal.c) used as HAL timebase. By default, this function is called each 1ms in Systick ISR. The PPP_IRQHandler() routine must call HAL_PPP_IRQHandler() if an interrupt based process is used within the application.
main.c/.h	This file contains the main program routine, mainly: • Call to HAL_Init() • assert_failed() implementation • system clock configuration • peripheral HAL initialization and user application code.

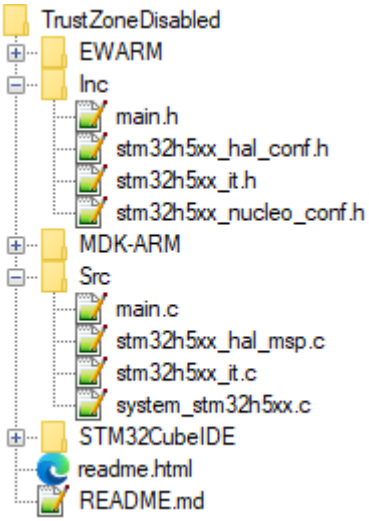
The STM32Cube package comes with ready-to-use project templates, one for each supported board. Each project contains the files listed above and a preconfigured project for the supported toolchains.

Each project template provides empty main loop function and can be used as a starting point to get familiar with project settings for STM32Cube. Its features are the following:

- It contains the sources of HAL, CMSIS and BSP drivers which are the minimal components to develop a code on a given board.
- It contains the include paths for all the firmware components.
- It defines the STM32 device supported, and allows configuring the CMSIS and HAL drivers accordingly.
- It provides ready to use user files preconfigured as defined below:
  - HAL is initialized
  - SysTick ISR implemented for HAL_GetTick()
  - System clock configured with the selected device frequency.

Note: If an existing project is copied to another location, then include paths must be updated.

Figure 1. Example of project template



3.2 HAL data structures

Each HAL driver can contain the following data structures:

- Peripheral handle structures
- Initialization and configuration structures
- Specific process structures.

3.2.1 Peripheral handle structures

The APIs have a modular generic multi-instance architecture that enables working with several IP instances simultaneously.

PPP_HandleTypeDef *handle is the main structure that is implemented in the HAL drivers. It handles the peripheral/module configuration and registers and embeds all the structures and variables needed to follow the peripheral device flow.

The peripheral handle is used for the following purposes:

- Multi-instance support: each peripheral/module instance has its own handle. As a result instance resources are independent.
- Peripheral process intercommunication: the handle is used to manage shared data resources between the process routines.
  Example: global pointers, DMA handles, state machine.
- Storage : this handle is used also to manage global variables within a given HAL driver.

An example of peripheral structure is shown below:

```
typedef struct
{
USART_TypeDef *Instance; /* USART registers base address */
USART_InitTypeDef Init; /* Usart communication parameters */
uint8_t *pTxBuffPtr;/* Pointer to Usart Tx transfer Buffer */
uint16_t TxXferSize; /* Usart Tx Transfer size */
__IO uint16_t TxXferCount;/* Usart Tx Transfer Counter */
uint8_t *pRxBuffPtr;/* Pointer to Usart Rx transfer Buffer */
uint16_t RxXferSize; /* Usart Rx Transfer size */
__IO uint16_t RxXferCount; /* Usart Rx Transfer Counter */
DMA_HandleTypeDef *hdmatx; /* Usart Tx DMA Handle parameters */
DMA_HandleTypeDef *hdmarx; /* Usart Rx DMA Handle parameters */
HAL_LockTypeDef Lock; /* Locking object */
__IO HAL_USART_StateTypeDef State; /* Usart communication state */
__IO HAL_USART_ErrorTypeDef ErrorCode;/* USART Error code */
}USART_HandleTypeDef;
```

Note:

1. *The multi-instance feature implies that all the APIs used in the application are reentrant and avoid using global variables because subroutines can fail to be reentrant if they rely on a global variable to remain unchanged but that variable is modified when the subroutine is recursively invoked. For this reason, the following rules are respected:*
   - *Reentrant code does not hold any static (or global) non-constant data: reentrant functions can work with global data. For example, a reentrant interrupt service routine can grab a piece of hardware status to work with (for example serial port read buffer) which is not only global, but volatile. Still, typical use of static variables and global data is not advised, in the sense that only atomic read-modify-write instructions should be used in these variables. It should not be possible for an interrupt or signal to occur during the execution of such an instruction.*
   - *Reentrant code does not modify its own code.*
2. *When a peripheral can manage several processes simultaneously using the DMA (full duplex case), the DMA interface handle for each process is added in the PPP_HandleTypeDef.*
3. *For the shared and system peripherals, no handle or instance object is used. The peripherals concerned by this exception are the following:*
   - *GPIO*
   - *SYSTICK*
   - *NVIC*
   - *PWR*
   - *RCC*
   - *FLASH*

3.2.2 Initialization and configuration structure

These structures are defined in the generic driver header file when it is common to all part numbers. When they can change from one part number to another, the structures are defined in the extension header file for each part number.

```
typedef struct
{
  uint32_t BaudRate;       /*!< This member configures the Usart communication baud rate.
                                The baud rate is computed using the following formula:
                                Baud Rate Register[15:4] = ((2 * fclk_pres) /
                                ((huart->Init.BaudRate)))[15:4]
                                Baud Rate Register[3]    = 0
                                Baud Rate Register[2:0]  =  (((2 * fclk_pres) /
                                ((huart->Init.BaudRate)))[3:0]) >> 1
                                where fclk_pres is the USART input clock frequency (fclk)
                                divided by a prescaler.
                                @note  Oversampling by 8 is systematically applied to
                                achieve high baud rates. */
  uint32_t WordLength;          /*!< Specifies the number of data bits
                                transmitted or received in a frame.This
              parameter can be a value of                                                USAR
TEx_Word_Length. */
  uint32_t StopBits;            /*!< Specifies the number of stop bits transmitted.
                                This parameter can be a value of USART_Stop_Bits. */
  uint32_t Parity;              /*!< Specifies the parity mode.
                                This parameter can be a value of USART_Parity
                                @note When parity is enabled, the computed parity is inserted
                                at the MSB position of the transmitted data (9th bit when
                                the word length is set to 9 data bits; 8th bit when the
                                word length is set to 8 data bits). */
  uint32_t Mode;                /*!< Specifies whether the Receive or
              Transmit mode is enabled or disabled.
                                This parameter can be a value of
              USART_Mode. */
  uint32_t CLKPolarity;         /*!< Specifies the steady state of the serial clock.
                                This parameter can be a value of USART_Clock_Polarity. */
  uint32_t CLKPhase;            /*!< Specifies the clock transition on
              which the bit capture is made.
                                This parameter can be a value of USART_Clock_Phase. */
  uint32_t CLKLastBit;          /*!< Specifies whether the clock pulse
              corresponding to the last transmitted data                                 bit
(MSB) has to be output on the SCLK pin                                  in synchronous mode.
                                This parameter can be a value of USART_Last_Bit. */
  uint32_t ClockPrescaler;      /*!< Specifies the prescaler value used to
              divide the USART clock source.
                                This parameter can be a value of USART_ClockPrescaler. */
} USART_InitTypeDef;
```

Note: The config structure is used to initialize the sub-modules or sub-instances. See below example:

```
HAL_ADC_ConfigChannel (ADC_HandleTypeDef* hadc, const ADC_ChannelConfTypeDef *pConfig)
```

3.2.3 Specific process structures

The specific process structures are used for specific process (common APIs). They are defined in the generic driver header file.

Example:

```
HAL_PPP_Process (PPP_HandleTypeDef* hadc,PPP_ProcessConfig* sConfig)
```

3.3 API classification

The HAL APIs are classified into the following categories:

- **Generic APIs:** common generic APIs applying to all STM32 devices. These APIs are consequently present in the generic HAL driver files of all STM32 microcontrollers.

```
HAL_StatusTypeDef HAL_ADC_Init(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_DeInit(ADC_HandleTypeDef *hadc);
HAL_StatusTypeDef HAL_ADC_Start(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Start_IT(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop_IT(ADC_HandleTypeDef* hadc);
void HAL_ADC_IRQHandler(ADC_HandleTypeDef* hadc);
```

- **Extension APIs:**
  This set of API is divided into two sub-categories :
  - **Family specific APIs**: APIs applying to a given family. They are located in the extension HAL driver file (see example below related to the ADC).

```
HAL_StatusTypeDef HAL_ADCEx_Calibration_Start(ADC_HandleTypeDef* hadc, uint32_t Si
ngleDiff);
uint32_t HAL_ADCEx_Calibration_GetValue(ADC_HandleTypeDef* hadc, uint32_t SingleDi
ff);
```

  - **Device part number specific APIs:**These APIs are implemented in the extension file and delimited by specific define statements relative to a given part number.

Note: The data structure related to the specific APIs is delimited by the device part number define statement. It is located in the corresponding extension header C file.

The following table summarizes the location of the different categories of HAL APIs in the driver files.

Table 4. API classification

	Generic file	Extension file
Common APIs	X	X
Family specific APIs	-	X
Device specific APIs	-	X

Note: Family specific APIs are only related to a given family. This means that if a specific API is implemented in another family, and the arguments of this latter family are different, additional structures and arguments might need to be added.

The IRQ handlers are used for common and family specific processes.

3.4 Devices supported by HAL/LL drivers

Table 5. List of devices supported by HAL/LL drivers

IP/Module	STM32H573xx	STM32H563xx	STM32H562xx	STM32H503xx
stm32h5xx_hal.c	YES	YES	YES	YES

3.5 HAL driver rules

3.5.1 HAL API naming rules

The following naming rules are used in HAL drivers:

Table 6. HAL API naming rules

	Generic	Family specific APIs	Device specific APIs
File names	*stm32h5xx_hal_ppp (c/h)*	*stm32h5xx_hal_ppp_ex (c/h)*	*stm32h5xx_ hal_ppp_ex (c/h)*
Module name	*HAL_PPP_ MODULE*		
Function name	*HAL_PPP_Function* *HAL_PPP_FeatureFunction_MODE*	*HAL_PPPEx_Function* *HAL_PPPEx_FeatureFunction_MODE*	*HAL_PPPEx_Function* *HAL_PPPEx_FeatureFunction_MODE*
Handle name	*PPP_HandleTypedef*	*NA*	*NA*
Init structure name	*PPP_InitTypeDef*	*NA*	*PPP_InitTypeDef*
Enum name	*HAL_PPP_StructnameTypeDef*	*NA*	*NA*

- The **PPP** prefix refers to the peripheral functional mode and not to the peripheral itself. For example, if the USART, PPP can be USART, IRDA, UART or SMARTCARD depending on the peripheral mode.
- The constants used in one file are defined within this file. A constant used in several files is defined in a header file. All constants are written in uppercase, except for peripheral driver function parameters.
- typedef variable names should be suffixed with _TypeDef.
- Registers are considered as constants. In most cases, their name is in uppercase and uses the same acronyms as in the STM32H5 reference manuals.
- Peripheral registers are declared in the PPP_TypeDef structure (for example ADC_TypeDef) in the stm32h5xxx.h header file:
stm32h5xxx.h corresponds to stm32h573xx, stm32h563xx, stm32h562xx and stm32h503xx.
- Peripheral function names are prefixed by HAL_, then the corresponding peripheral acronym in uppercase followed by an underscore. The first letter of each word is in uppercase (for example HAL_UART_Transmit()). Only one underscore is allowed in a function name to separate the peripheral acronym from the rest of the function name.
- The structure containing the PPP peripheral initialization parameters are named PPP_InitTypeDef (for example ADC_InitTypeDef).
- The structure containing the Specific configuration parameters for the PPP peripheral are named PPP_xxxxConfTypeDef (for example ADC_ChannelConfTypeDef).
- Peripheral handle structures are named PPP_HandleTypedef (e.g DMA_HandleTypeDef)
- The functions used to initialize the PPP peripheral according to parameters specified in PPP_InitTypeDef are named HAL_PPP_Init (for example HAL_TIM_Init()).
- The functions used to reset the PPP peripheral registers to their default values are named HAL_PPP_DeInit (for example HAL_TIM_DeInit()).
- The **MODE** suffix refers to the process mode, which can be polling, interrupt or DMA. As an example, when the DMA is used in addition to the native resources, the function should be called:
HAL_PPP_Function_DMA().
- The **Feature** prefix should refer to the new feature.
Example: *HAL_ADCEx_InjectedStart()*() refers to the injection mode.

3.5.2 HAL general naming rules

- For the shared and system peripherals, no handle or instance object is used. This rule applies to the following peripherals:
  - GPIO
  - SYSTICK
  - NVIC
  - RCC
  - FLASH

Example: The *HAL_GPIO_Init()* requires only the GPIO address and its configuration parameters.

```
HAL_StatusTypeDef HAL_GPIO_Init (GPIO_TypeDef* GPIOx, GPIO_InitTypeDef *Init)
{
/*GPIO Initialization body */
}
```

- The macros that handle interrupts and specific clock configurations are defined in each peripheral/module driver. These macros are exported in the peripheral driver header files so that they can be used by the extension file. The list of these macros is defined below:

Note: This list is not exhaustive and other macros related to peripheral features can be added, so that they can be used in the user application.

Table 7. Macros handling interrupts and specific clock configurations

Macros	Description
__HAL_PPP_ENABLE_IT(__HANDLE__, __INTERRUPT__)	Enables a specific peripheral interrupt
__HAL_PPP_DISABLE_IT(__HANDLE__, __INTERRUPT__)	Disables a specific peripheral interrupt
__HAL_PPP_GET_IT (__HANDLE__, __ INTERRUPT __)	Gets a specific peripheral interrupt status
__HAL_PPP_CLEAR_IT (__HANDLE__, __ INTERRUPT __)	Clears a specific peripheral interrupt status
__HAL_PPP_GET_FLAG (__HANDLE__, __FLAG__)	Gets a specific peripheral flag status
__HAL_PPP_CLEAR_FLAG (__HANDLE__, __FLAG__)	Clears a specific peripheral flag status
__HAL_PPP_ENABLE(__HANDLE__)	Enables a peripheral
__HAL_PPP_DISABLE(__HANDLE__)	Disables a peripheral
__HAL_PPP_XXXX (__HANDLE__, __PARAM__)	Specific PPP HAL driver macro
__HAL_PPP_GET_ IT_SOURCE (__HANDLE__, __ INTERRUPT __)	Checks the source of specified interrupt

- NVIC and SYSTICK are two Arm® Cortex® core features. The APIs related to these features are located in the stm32h5xx_hal_cortex.c file.
- The PPP handles are valid before using the HAL_PPP_Init() API. The init function performs a check before modifying the handle fields.

```
 HAL_PPP_Init(PPP_HandleTypeDef)
if(hppp == NULL)
 {
 return HAL_ERROR;
 }
```

- The macros defined below are used:
  - Conditional macro:

```
#define ABS(x) (((x) > 0) ? (x) : -(x))
```

  - Pseudo-code macro (multiple instructions macro):

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
(__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
(__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

3.5.3 HAL interrupt handler and callback functions

Besides the APIs, HAL peripheral drivers include:

- HAL_PPP_IRQHandler() peripheral interrupt handler that should be called from stm32h5xx_it.c
- User callback functions.

The user callback functions are defined as empty functions with “weak” attribute. They have to be defined in the user code.

There are three types of user callbacks functions:

- Peripheral system level initialization/ de-Initialization callbacks: HAL_PPP_MspInit() and HAL_PPP_MspDeInit
- Process complete callbacks : HAL_PPP_ProcessCpltCallback
- Error callback: HAL_PPP_ErrorCallback.

Table 8. Callback functions

Callback functions	Example
HAL_PPP_MspInit() / _DeInit()	Example: HAL_USART_MspInit() Called from HAL_PPP_Init() API function to perform peripheral system level initialization (GPIOs, clock, DMA, interrupt)
HAL_PPP_ProcessCpltCallback	Example: HAL_USART_TxCpltCallback Called by peripheral or DMA interrupt handler when the process completes
HAL_PPP_ErrorCallback	Example: HAL_USART_ErrorCallback Called by peripheral or DMA interrupt handler when an error occurs

3.6 HAL generic APIs

The generic APIs provide common generic functions applying to all STM32 devices. They are composed of four APIs groups:

- **Initialization and de-initialization functions:**HAL_PPP_Init(), HAL_PPP_DeInit()
- **IO operation functions**: HAL_PPP_Read(), HAL_PPP_Write(),HAL_PPP_Transmit(), HAL_PPP_Receive()
- **Control functions**: HAL_PPP_Set (), HAL_PPP_Get ().
- **State and Errors functions**: HAL_PPP_GetState (), HAL_PPP_GetError ().

For some peripheral/module drivers, these groups are modified depending on the peripheral/module implementation.

Example: in the timer driver, the API grouping is based on timer features (such as PWM, OC and IC).

The initialization and de-initialization functions allow initializing a peripheral and configuring the low-level resources, mainly clocks, GPIO, alternate functions (AF) and possibly DMA and interrupts. The *HAL_DeInit()* function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.

The IO operation functions perform a row access to the peripheral payload data in write and read modes.

The control functions are used to change dynamically the peripheral configuration and set another operating mode.

The peripheral state and errors functions allow retrieving in run time the peripheral and data flow states, and identifying the type of errors that occurred. The example below is based on the ADC peripheral. The list of generic APIs is not exhaustive. It is only given as an example.

Table 9. HAL generic APIs

Function group	Common API name	Description
Initialization group	*HAL_ADC_Init()*	This function initializes the peripheral and configures the low -level resources (clocks, GPIO, AF..)
	HAL_ADC_DeInit()	This function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.
IO operation group	*HAL_ADC_Start ()*	This function starts ADC conversions when the polling method is used
	HAL_ADC_Stop ()	This function stops ADC conversions when the polling method is used
	HAL_ADC_PollForConversion()	This function allows waiting for the end of conversions when the polling method is used. In this case, a timout value is specified by the user according to the application.
	HAL_ADC_Start_IT()	This function starts ADC conversions when the interrupt method is used
	HAL_ADC_Stop_IT()	This function stops ADC conversions when the interrupt method is used
	HAL_ADC_IRQHandler()	This function handles ADC interrupt requests
	HAL_ADC_ConvCpltCallback()	Callback function called in the IT subroutine to indicate the end of the current process or when a DMA transfer has completed
	HAL_ADC_ErrorCallback()	Callback function called in the IT subroutine if a peripheral error or a DMA transfer error occurred
Control group	*HAL_ADC_ConfigChannel()*	This function configures the selected ADC regular channel, the corresponding rank in the sequencer and the sample time
	HAL_ADC_AnalogWDGConfig	This function configures the analog watchdog for the selected ADC
State and Errors group	*HAL_ADC_GetState()*	This function allows getting in run time the peripheral and the data flow states.
	HAL_ADC_GetError()	This fuction allows getting in run time the error that occurred during IT routine

3.7 HAL extension APIs

3.7.1 HAL extension model overview

The extension APIs provide specific functions or overwrite modified APIs for a specific family (series) or specific part number within the same family.

The extension model consists of an additional file, stm32h5xx_hal_ppp_ex.c, that includes all the specific functions and define statements (stm32h5xx_hal_ppp_ex.h) for a given part number.

Below an example based on the ADC peripheral:

Table 10. HAL extension APIs

Function group	Common API name
HAL_ADCEx_CalibrationStart()	This function is used to start the automatic ADC calibration
HAL_ADCEx_InjectedStart	This function is used to start the conversion of injected groups.

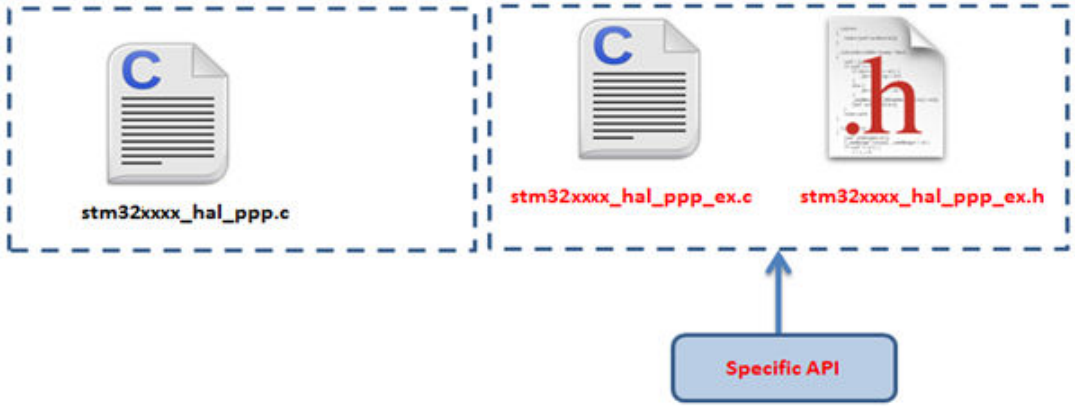
3.7.2 HAL extension model cases

The specific peripheral features can be handled by the HAL drivers in five different ways. They are described below.

Adding a part number-specific function

When a new feature specific to a given device is required, the new APIs are added in the stm32h5xx_hal_ppp_ex.c extension file. They are named HAL_PPPEx_Function().

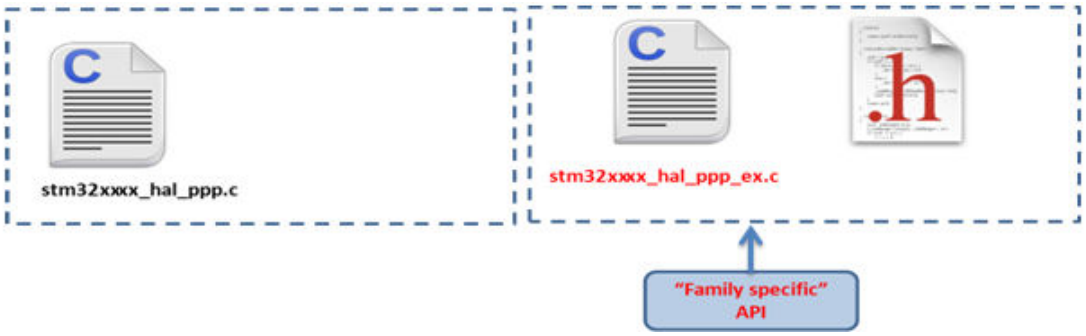
Figure 2. Adding device-specific functions



Adding a family-specific function

In this case, the API is added in the extension driver C file and named HAL_PPPEx_Function ().

Figure 3. Adding family-specific functions

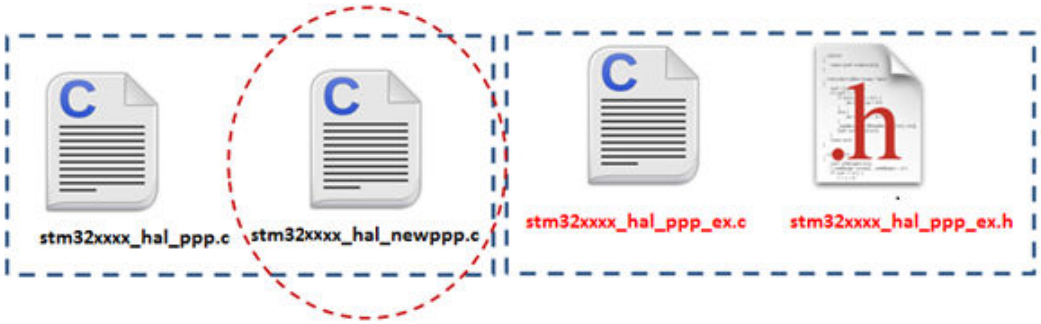


Adding a new peripheral (specific to a device belonging to a given family)

When a peripheral which is available only in a specific device is required, the APIs corresponding to this new peripheral/module (newPPP) are added in a new stm32h5xx_hal_newppp.c. However the inclusion of this file is selected in the stm32h5xx_hal_conf.h using the macro:

```
#define HAL_NEWPPP_MODULE_ENABLED
```

Figure 4. **Adding new peripherals**

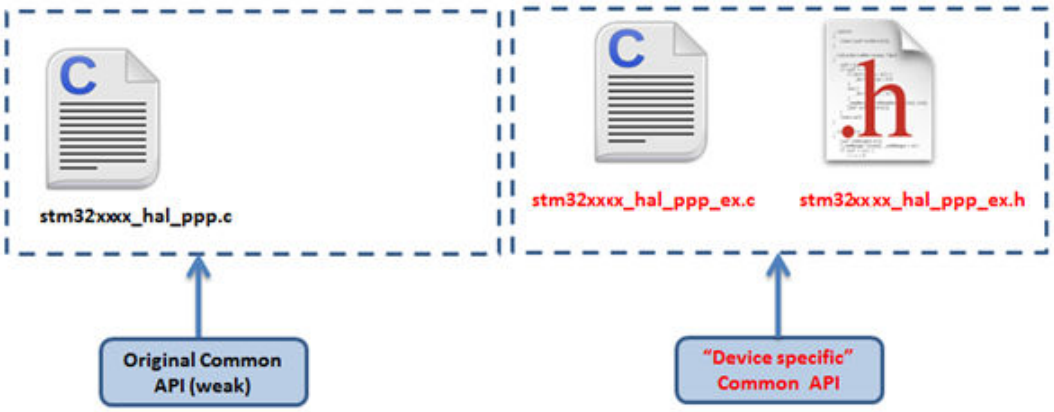


Example: stm32h5xx_hal_adc.c/h

Updating existing common APIs

In this case, the routines are defined with the same names in the stm32h5xx_hal_ppp_ex.c extension file, while the generic API is defined as *weak*, so that the compiler overwrites the original routine by the new defined function.

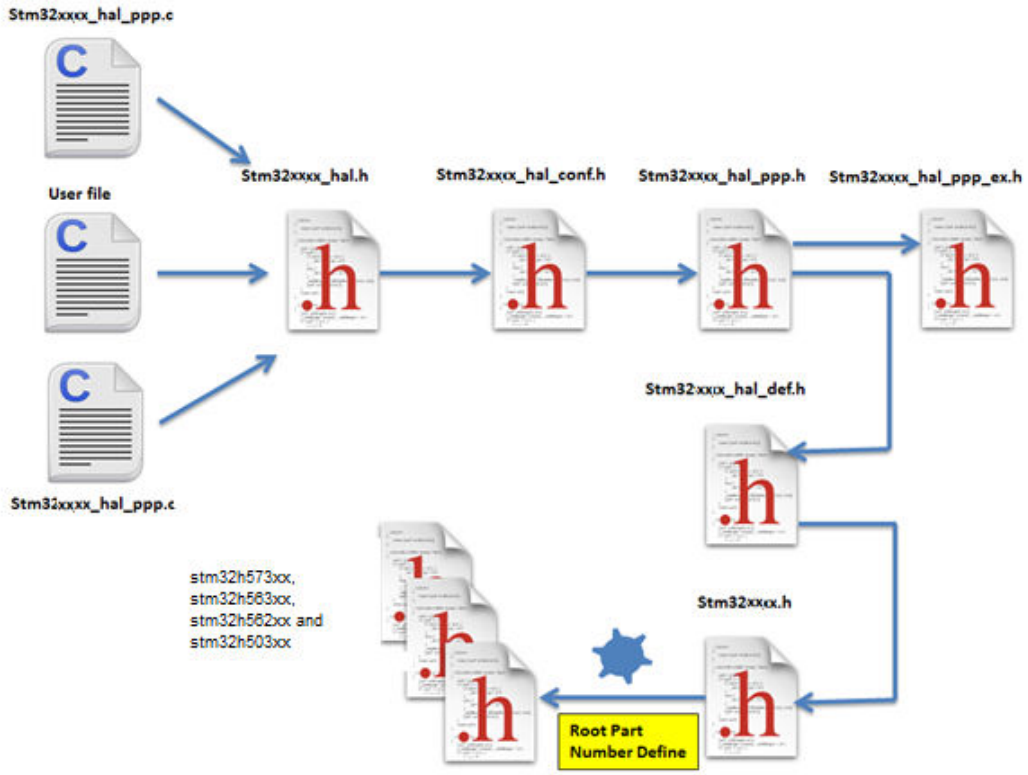
Figure 5. **Updating existing APIs**



3.8 File inclusion model

The header of the common HAL driver file (stm32h5xx_hal.h) includes the common configurations for the whole HAL library. It is the only header file that is included in the user sources and the HAL C sources files to be able to use the HAL resources.

Figure 6. File inclusion model



A PPP driver is a standalone module which is used in a project. The user must enable the corresponding USE_HAL_PPP_MODULE define statement in the configuration file.

```
/**********************************************************************
* @file stm32h5xx_hal_conf.h
* @author MCD Application Team
* @brief   HAL configuration file.
**********************************************************************
(…)
#define HAL_USART_MODULE_ENABLED
#define HAL_IRDA_MODULE_ENABLED
#define HAL_DMA_MODULE_ENABLED
#define HAL_RCC_MODULE_ENABLED
(…)
```

3.9 HAL common resources

The common HAL resources, such as common define enumerations, structures and macros, are defined in *stm32h5xx_hal_def.h*.The main common define enumeration is *HAL_StatusTypeDef*.

- **HAL Status**
  The HAL status is used by almost all HAL APIs, except for boolean functions and IRQ handler. It returns the status of the current API operations. It has four possible values as described below:

```
Typedef enum
{
HAL_OK = 0x00,
HAL_ERROR = 0x01,
HAL_BUSY = 0x02,
HAL_TIMEOUT = 0x03
} HAL_StatusTypeDef;
```

- **HAL Locked**
  The HAL lock is used by all HAL APIs to prevent accessing by accident shared resources.

```
typedef enum
{
HAL_UNLOCKED = 0x00, /*!<Resources unlocked */
HAL_LOCKED = 0x01 /*!< Resources locked */
} HAL_LockTypeDef;
```

  In addition to common resources, the stm32h5xx_hal_def.h file calls the stm32h5xx.h file in CMSIS library to get the data structures and the address mapping for all peripherals:
  - Declarations of peripheral registers and bits definition.
  - Macros to access peripheral registers hardware (such as Write register or Read register).
- **Common macros**
  - Macro defining HAL_MAX_DELAY

```
#define HAL_MAX_DELAY 0xFFFFFFFF
```

  - Macro linking a PPP peripheral to a DMA structure pointer:

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
  (__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
  (__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

3.10 HAL configuration

The configuration file, stm32h5xx_hal_conf.h, allows customizing the drivers for the user application. Modifying this configuration is not mandatory: the application can use the default configuration without any modification.

To configure these parameters, the user should enable, disable or modify some options by uncommenting, commenting or modifying the values of the related define statements as described in the table below:

Table 11. Define statements used for HAL configuration

Configuration item	Description	Default Value
HSE_VALUE	Defines the value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	25 000 000 Hz
HSE_STARTUP_TIMEOUT	Timeout for HSE start-up, expressed in ms	100 ms
HSI_VALUE	Defines the value of the internal oscillator (HSI) expressed in Hz.	64 000 000 Hz
HSI48_VALUE	Value of the internal high speed oscillator for USB FS/SDMMC/RNG expressed in Hz. The real value may vary depending on manufacturing process.	48000000 Hz
CSI_VALUE	Defines the default value of the low-power internal oscillator (CSI) expressed in Hz.	4 000 000 Hz

Configuration item	Description	Default Value
LSI_VALUE	Defines the default value of the Low-speed internal oscillator (LSI) expressed in Hz.	32000 Hz
LSI_STARTUP_TIMEOUT	Timeout for LSI startup, expressed in ms	130 ms
LSE_VALUE	Defines the value of the external oscillator (LSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	32768 Hz
LSE_STARTUP_TIMEOUT	Timeout for LSE start-up, expressed in ms	5000 Hz
VDD_VALUE	V_{DD} value	3300 mV
USE_RTOS	Enables the use of RTOS	FALSE (for future use)
PREFETCH_ENABLE	Enables prefetch	FALSE

Note: The stm32h5xx_hal_conf_template.h file is located in the HAL drivers Inc folder. It should be copied to the user folder, renamed and modified as described above.

By default, the values defined in the stm32h5xx_hal_conf_template.h file are the same as the ones used for the examples and demonstrations. All HAL include files are enabled so that they can be used in the user code without modifications.

3.11 HAL system peripheral handling

This section gives an overview of how the system peripherals are handled by the HAL drivers. The full API list is provided within each peripheral driver description section.

3.11.1 Clocks

Two main functions can be used to configure the system clock:

- HAL_RCC_OscConfig (RCC_OscInitTypeDef *RCC_OscInitStruct). This function configures/enables multiple clock sources (HSE, HSI, HSI48, CSI, LSE, LSI, PLL).
- HAL_RCC_ClockConfig (RCC_ClkInitTypeDef *RCC_ClkInitStruct, uint32_t FLatency). This function
  - selects the system clock source
  - configures APB1, APB2, and APB3 clock dividers
  - configures the number of Flash memory wait states
  - updates the SysTick configuration when HCLK clock changes.

Some peripheral clocks are not derived from the system clock (such as RTC, USB). In this case, the clock configuration is performed by an extended API defined in stm32h5xx_hal_rcc_ex.c: *HAL_RCCEx_PeriphCLKConfig(RCC_PeriphCLKInitTypeDef *PeriphClkInit)*.

Additional RCC HAL driver functions are available:

- HAL_RCC_DeInit() Clock de-initialization function that returns clock configuration to reset state
- Get clock functions that allow retreiving various clock configurations (such as system clock, HCLK, PCLK1, PCLK2, or PCLK3)
- MCO and CSS configuration functions

A set of macros are defined in stm32h5xx_hal_rcc.h and stm32h5xx_hal_rcc_ex.h. They allow executing elementary operations on RCC block registers, such as peripherals clock gating/reset control:

- __HAL_PPP_CLK_ENABLE/__HAL_PPP_CLK_DISABLE to enable/disable the peripheral clock.
- __HAL_PPP_FORCE_RESET/__HAL_PPP_RELEASE_RESET to force/release peripheral reset
- __HAL_PPP_CLK_SLEEP_ENABLE/__HAL_PPP_CLK_SLEEP_DISABLE to enable/disable the peripheral clock during Sleep mode.
- __HAL_PPP_IS_CLK_ENABLED/__HAL_PPP_IS_CLK_DISABLED to query about the enabled/disabled status of the peripheral clock.
- __HAL_PPP_IS_CLK_SLEEP_ENABLED/__HAL_PPP_IS_CLK_SLEEP_DISABLED to query about the enabled/disabled status of the peripheral clock during Sleep mode.

3.11.2 GPIOs

GPIO HAL APIs are the following:

- HAL_GPIO_Init() / HAL_GPIO_DeInit()
- HAL_GPIO_ReadPin() / HAL_GPIO_WritePin()
- HAL_GPIO_TogglePin ().
- HAL_GPIO_LockPin()/HAL_GPIO_WritePin()
- HAL_GPIO_EnableHighSPeedLowVoltage()/HAL_GPIO_DisableHighSPeedLowVoltage()

In addition to standard GPIO modes (input, output, analog), the pin mode can be configured as EXTI with interrupt or event generation.

When selecting EXTI mode with interrupt generation, the user must call HAL_GPIO_EXTI_IRQHandler() from stm32h5xx_it.c and implement HAL_GPIO_EXTI_Callback()

The table below describes the GPIO_InitTypeDef structure field.

Table 12. Description of GPIO_InitTypeDef structure

Structure field	Description
Pin	Specifies the GPIO pins to be configured. Possible values: GPIO_PIN_x or GPIO_PIN_All, where x[0..15]
Mode	Specifies the operating mode for the selected pins: GPIO mode or EXTI mode. Possible values are: • GPIO mode – GPIO_MODE_INPUT : Input floating – GPIO_MODE_OUTPUT_PP : Output push-pull – GPIO_MODE_OUTPUT_OD : Output open drain – GPIO_MODE_AF_PP : Alternate function push-pull – GPIO_MODE_AF_OD : Alternate function open drain – GPIO_MODE_ANALOG : Analog mode – GPIO_MODE_ANALOG_ADC_CONTROL: ADC analog mode • External Interrupt mode – GPIO_MODE_IT_RISING : Rising edge trigger detection – GPIO_MODE_IT_FALLING : Falling edge trigger detection – GPIO_MODE_IT_RISING_FALLING : Rising/Falling edge trigger detection • External Event mode – GPIO_MODE_EVT_RISING : Rising edge trigger detection – GPIO_MODE_EVT_FALLING : Falling edge trigger detection – GPIO_MODE_EVT_RISING_FALLING: Rising/Falling edge trigger detection
Pull	Specifies the Pull-up or Pull-down activation for the selected pins. Possible values are: GPIO_NOPULL GPIO_PULLUP GPIO_PULLDOWN
Speed	Specifies the speed for the selected pins Possible values are: GPIO_SPEED_FREQ_LOW GPIO_SPEED_FREQ_MEDIUM GPIO_SPEED_FREQ_HIGH GPIO_SPEED_FREQ_VERY_HIGH

Please find below typical GPIO configuration examples:

- Configuring GPIOs as output push-pull to drive external LEDs:

```
GPIO_InitStruct.Pin = GPIO_PIN_12 | GPIO_PIN_13 | GPIO_PIN_14 | GPIO_PIN_15;
GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
GPIO_InitStruct.Pull = GPIO_PULLUP;
GPIO_InitStruct.Speed = GPIO_SPEED_FREQ_MEDIUM;
HAL_GPIO_Init(GPIOD, &GPIO_InitStruct);
```

- Configuring PA0 as external interrupt with falling edge sensitivity:

```
GPIO_InitStructure.Mode = GPIO_MODE_IT_FALLING;
GPIO_InitStructure.Pull = GPIO_NOPULL;
GPIO_InitStructure.Pin = GPIO_PIN_0;
HAL_GPIO_Init(GPIOA, &GPIO_InitStructure);
```

3.11.3 Cortex® NVIC and SysTick timer

The Cortex® HAL driver, stm32h5xx_hal_cortex.c, provides APIs to handle NVIC and SysTick. The supported APIs include:

- HAL_NVIC_SetPriority()/ HAL_NVIC_SetPriorityGrouping()
- HAL_NVIC_GetPriority() / HAL_NVIC_GetPriorityGrouping()
- HAL_NVIC_EnableIRQ()/HAL_NVIC_DisableIRQ()
- HAL_NVIC_SystemReset()
- HAL_SYSTICK_IRQHandler()
- HAL_NVIC_GetPendingIRQ() / HAL_NVIC_SetPendingIRQ () / HAL_NVIC_ClearPendingIRQ()
- HAL_NVIC_GetActive(IRQn)
- HAL_SYSTICK_Config()
- HAL_SYSTICK_CLKSourceConfig()
- HAL_SYSTICK_Callback()
- HAL_MPU_Enable()
- HAL_MPU_Enable_NS()
- HAL_MPU_Disable()
- HAL_MPU_Disable_NS()
- HAL_MPU_ConfigRegion()
- HAL_MPU_ConfigRegion_NS()
- HAL_MPU_ConfigMemoryAttributes()
- HAL_MPU_ConfigMemoryAttributes_NS()
- MPU_ConfigRegion()
- MPU_ConfigMemoryAttributes()

3.11.4 PWR

The PWR HAL driver handles power management. The features shared between all STM32 Series are listed below:

- PVD configuration, enabling/disabling and interrupt handling
  - HAL_PWR_ConfigPVD()
  - HAL_PWR_EnablePVD() / HAL_PWR_DisablePVD()
  - HAL_PWR_PVD_IRQHandler()
  - HAL_PWR_PVDCallback()
- AVD configuration, enabling/disabling and interrupt handling:
  - HAL_PWREx_ConfigAVD()
  - HAL_PWREx_EnableAVD() / HAL_PWREx_DisableAVD()
  - HAL_PWREx_AVD_PVD_IRQHandler()
  - HAL_PWREx_PVD_AVD_Rising_Callback()
  - HAL_PWREx_PVD_AVD_Falling_Callback()

- Wakeup pin configuration
  - HAL_PWR_EnableWakeUpPin() / HAL_PWR_DisableWakeUpPin()
- Low-power mode entry
  - HAL_PWR_EnterSLEEPMode()
  - HAL_PWR_EnterSTOPMode() (kept for compatibility with other families)
  - HAL_PWR_EnterSTANDBYMode()
- STM32H5 low-power management features:
  - HAL_PWR_EnableSleepOnExit() / HAL_PWR_DisableSleepOnExit: (low-power management Sleep-on-entry)
  - HAL_PWR_EnableSEVOnPend() / HAL_PWR_DisableSEVOnPend (low-power management Cortex-SEV-on-pend)

3.11.5 EXTI

The EXTI is not considered as a standalone peripheral but rather as a service used by other peripheral, that are handled through EXTI HAL APIs. In addition, each peripheral HAL driver implements the associated EXTI configuration and function as macros in its header file.

The first 16 EXTI lines connected to the GPIOs, are managed within the GPIO driver. The GPIO_InitTypeDef structure allows configuring an I/O as external interrupt or external event.

The EXTI lines connected internally to the PVD/AVD, RTC, USB, and Ethernet, are configured within the HAL drivers of these peripheral through the macros given in the table below.

The EXTI internal connections depend on the targeted STM32 microcontroller (refer to the product datasheet for more details):

Table 13. Description of EXTI configuration macros

Macros	Description
__HAL_PPP_{SUBLOCK}__EXTI_ENABLE_IT()	Enables a given EXTI line interrupt Example: __HAL_PWR_PVD_EXTI_ENABLE_IT()
__HAL_PPP_{SUBLOCK}__EXTI_DISABLE_IT()	Disables a given EXTI line. Example: __HAL_PWR_PVD_EXTI_DISABLE_IT()
__HAL_ PPP_{SUBLOCK}__EXTI_GET_FLAG()	Gets a given EXTI line interrupt flag pending bit status. Example: __HAL_PWR_PVD_EXTI_GET_FLAG()
__HAL_ PPP_{SUBLOCK}_EXTI_CLEAR_FLAG()	Clears a given EXTI line interrupt flag pending bit. Example; __HAL_PWR_PVD_EXTI_CLEAR_FLAG()
__HAL_PPP_SUBBLOCK_EXTI_ENABLE_EVENT()	Enable a given EXTI line event Example: __HAL_PWR_PVD_EXTI_ENABLE_EVENT()
__HAL_PPP_SUBBLOCK_EXTI_DISABLE_EVENT()	Disable a given EXTI line event Example: __HAL_PWR_PVD_EXTI_DISABLE_EVENT()
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_EDGE()	Configure an EXTI Interrupt or Event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_FALLING_EDGE()	Enable an EXTI Interrupt or Event on Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_EDGE()	Disable an EXTI Interrupt or Event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_FALLING_EDGE()	Disable an EXTI Interrupt or Event on Falling edge

Macros	Description
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_FALLING_EDGE()	Enable an EXTI Interrupt or Event on Rising/Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_FALLING_EDGE()	Disable an EXTI Interrupt or Event on Rising/Falling edge

If the EXTI interrupt mode is selected, the user application must call HAL_PPP_FUNCTION_IRQHandler() (for example HAL_PWR_PVD_IRQHandler()), from stm32h5xx_it.c file, and implement HAL_PPP_FUNCTIONCallback() callback function (for example HAL_PWR_PVDCallback().

3.11.6 DMA

DMA transfer modes are divided into two main categories:

- Normal transfers (as for legacy Series)
- Linked-list transfers

In addition to linked-list capability, all the advanced DMA features are managed and configured via the extended API as extensions to Normal mode. The advanced features are repeated block, trigger and data handling.

For a given channel, enable and configure the peripheral to be connected to the DMA channel (except for internal SRAM and Flash memories for which no initialization is required). Refer to the device reference manuals for details on the connection between peripherals and DMA requests.

The Normal transfer mode is initialized via the standard API while the Linked-list mode is configured via the extended API.

Alternatively to the Normal programming mode, a DMA channel can be programmed by a list of transfers, also known as linked-list (list of node items), each node being defined by its data structure and specifying a standalone DMA channel. When enabled, the DMA channel fetches the first linked-list node from SRAM (also known as head node). When the execution is complete, it fetches and executes the next linked-list node. This operation is repeated until the end of the linked-list queue. The linked-list can be linear or circular:

- Linear linked-list:
  The last linked-list queue node is not linked to another queue node. The DMA channel fetches and executes the whole DMA linked-list queue from the first node (head node) to the last (tail node). When the last node execution is complete, the DMA channel remains in idle state and another transfer can be launched.
- Circular linked-list:
  The last linked-list node can be linked to any linked-list queue node. The DMA channel fetches and executes the whole DMA linked-list queue from the first node to the last. When the last node is executed, the DMA channel fetches again the first circular node and repeats the same sequence in an infinite loop (circular transfer). An abort operation is required to stop the DMA channel. The Circular linked-list mode replaces the legacy Circular transfer mode.

To reduce linked-list queue execution time and power consumption, the DMA channel supports dynamic linked-list execution in two types of formats, static and dynamic:

- Static linked-list format: this format refers to the full linked-list node where all DMA channel parameters are fetched and executed independently of the redundancy of information.
- Dynamic linked-list: this format refers to the customized linked-list node where only the necessary DMA channel parameters are fetched and executed (for example, no update is required if data size = 20 on previous node, and data size = 20 on the current node).

For linked-list transfers, the DMA channel can execute the linked-list queue node by node. This feature is named link-step mode. When activated, enabling the DMA channel for the first time fetches the head node from memory and stops. Another DMA channel enable is then required to execute the node. After that, the DMA channel must remain enabled to execute each node until the end of the linked-list queue. When the linked-list queue is circular, the DMA channel must be enabled in an infinite loop to keep the DMA channel running. This feature is useful for debug purposes or for executing queue nodes asynchronously.

Each DMA channel transfer (normal or linked-list) can be configured depending on the DMA channel instance embedded in the devices. The configurations are the following:

- Repeated block configuration:
  This feature is also named two-dimension addressing transfer. If it is supported, the DMA channel can perform repeated transfers of programmed blocks (the size of the block transfer is the legacy data size). In addition to the block repeat count, the DMA channel addresses can jump at burst or block level. The jump length is a programmable parameter defined in the user application:
  - Jump at burst level: the DMA channel keeps an empty area between two consecutive transmitted bursts.
  - Jump at block level; the DMA channel keeps an empty area between two consecutive transmitted blocks .
- Trigger configuration:
  The DMA channel transfers can be triggered on the rising or falling edge of a given signal (hardware triggers). The trigger condition can be applied at single/burst level, block level, repeated block level or node level.
  The DMA channel can report a trigger overrun when more than two trigger signal events are detected before executing the current transfer.
- Data handling:
  The data handling feature is based on a FIFO capability that can be:
  - Padding pattern: the padding pattern (zero padding or sign extension) is selected when the source data width is smaller than the destination data width.
  - Truncation: the source data is truncated when the source data width is bigger than the destination data width.
  - Pack/unpack: a set of data can be packed when the source data width is smaller than the destination data width or unpacked when the source data width is bigger than the destination data width.
  - Exchange: data can be exchanged at byte and half-word level on the destination, and byte level on the source.

Each ongoing DMA channel transfer (normal or linked-list) can be suspended and resumed at run time by the application. When trying to suspend an ongoing transfer, the DMA channel is not suspended instantly. Instead, the ongoing single/burst transfer completes and then stops.

When the DMA channel is suspended, the current transfer can be resumed instantly.

The DMA channel that supports the FIFO can report in real time the number of beats remaining on the destination FIFO ((output).

Two operating modes are available:

- Polling mode I/O operation
  1. Use HAL_DMA_Start() to start DMA transfer when the source and destination addresses and the Length of data to be transferred have been configured.
  2. Use HAL_DMA_PollForTransfer() to poll for the end of current transfer. In this case a fixed timeout can be configured depending on the user application.
- Interrupt mode I/O operation
  1. Configure the DMA interrupt priority using HAL_NVIC_SetPriority().
  2. Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ().
  3. Use HAL_DMA_Start_IT() to start DMA transfer when the source and destination addresses and the length of data to be transferred have been configured. In this case the DMA interrupt is configured.
  4. Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() Interrupt subroutine.
  5. When data transfer is complete, HAL_DMA_IRQHandler() function is executed and a user function can be called by customizing XferCpltCallback and XferErrorCallback function pointer (that is a member of DMA handle structure).

Additional functions and macros are available to ensure efficient DMA management:

- Use HAL_DMA_GetState() function to return the DMA state and HAL_DMA_GetError() in case of error detection.
- Use HAL_DMA_Abort() function to abort the current transfer.

The most used DMA HAL driver macros are the following:

- __HAL_DMA_ENABLE: enables the specified DMA channel

- __HAL_DMA_DISABLE: disables the specified DMA channel
- __HAL_DMA_GET_FLAG: gets the DMA channel pending flags
- __HAL_DMA_CLEAR_FLAG: clears the DMA channel pending flags
- __HAL_DMA_ENABLE_IT: enables the specified DMA channel interrupts
- __HAL_DMA_DISABLE_IT: disables the specified DMA channel interrupts
- __HAL_DMA_GET_IT_SOURCE: checks whether the specified DMA channel interrupt has been enabled or not

To correctly use the DMA linked-list feature, apply the following call sequences:

- Linear transfer:
  - Linked-list queue building
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_ConvertQToDynamic()
  - Linked-list queue execution
    - HAL_DMAEx_List_Init()
    - HAL_DMAEx_List_LinkQ()
    - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
    - HAL_DMAEx_List_UnLinkQ()
    - HAL_DMAEx_List_DeInit()
- Circular transfer:
  - Linked-list queue building
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_SetCircularModeConfig()/HAL_DMAEx_List_SetCircularMode()
    - HAL_DMAEx_List_ConvertQToDynamic()
  - Linked-list queue execution
    - HAL_DMAEx_List_Init()
    - HAL_DMAEx_List_LinkQ()
    - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
    - HAL_DMA_Abort() / HAL_DMA_Abort_IT()
    - HAL_DMAEx_List_UnLinkQ()
    - HAL_DMAEx_List_DeInit()

Note: When a peripheral is used in DMA mode, the DMA initialization must be done in the HAL_PPP_MspInit() callback. In addition, the user application must associate the DMA handle to the PPP handle (refer to section "HAL IO operation functions").

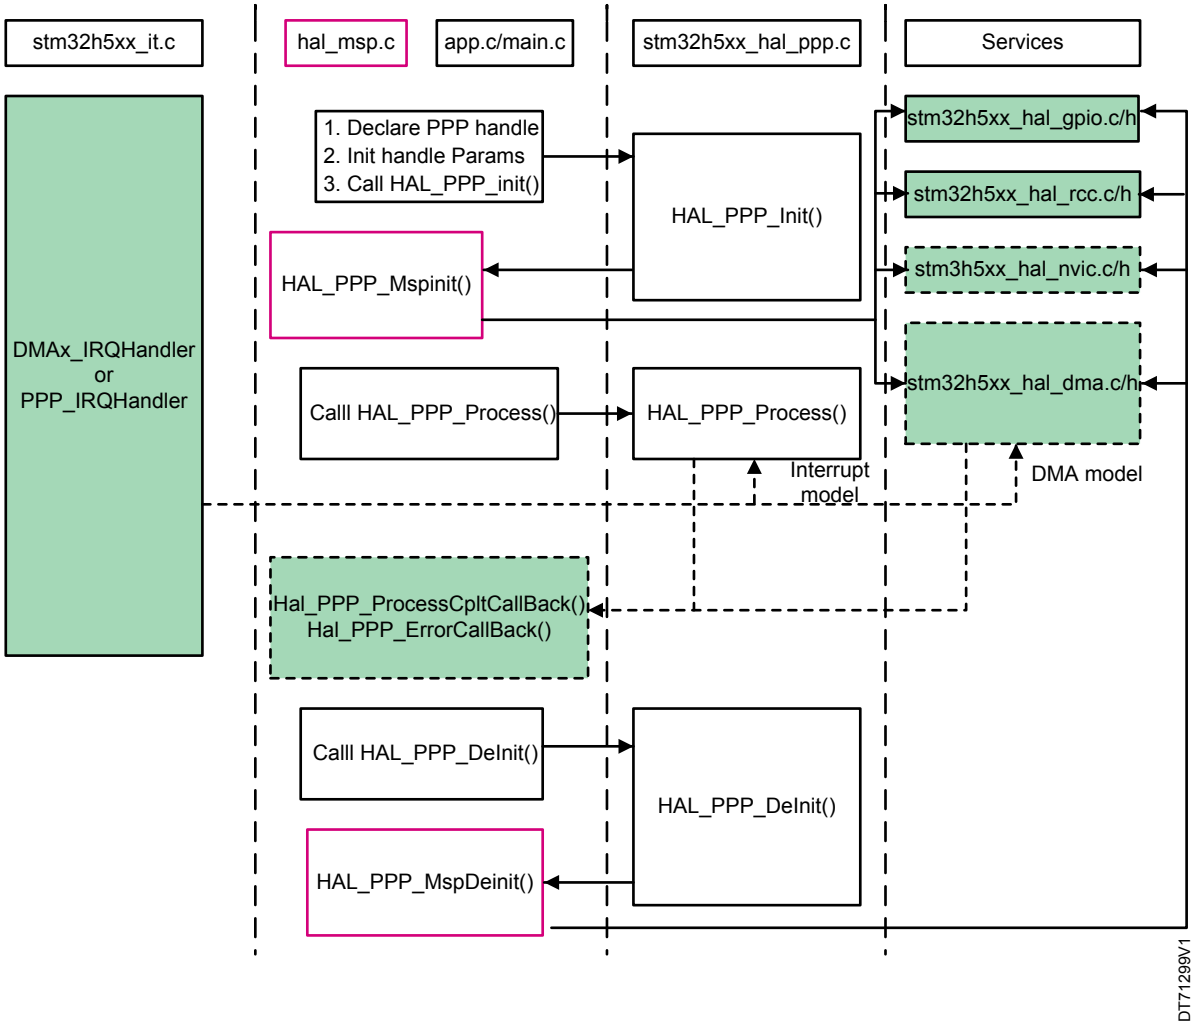
Note: DMA channel callbacks need to be initialized by the user application only in case of memory-to-memory transfer. However when peripheral-to-memory transfers are used, these callbacks are automatically initialized by calling a process API function that uses the DMA.

3.12 How to use HAL drivers

3.12.1 HAL usage models

The following figure shows the typical use of the HAL driver and the interaction between the application user, the HAL driver and the interrupts.

Figure 7. **HAL driver model**



Note: The functions implemented in the HAL driver are shown in green, the functions called from interrupt handlers in dotted lines, and the msp functions implemented in the user application in red. Non-dotted lines represent the interactions between the user application functions.

Basically, the HAL driver APIs are called from user files and optionally from interrupt handlers file when the APIs based on the DMA or the PPP peripheral dedicated interrupts are used.

When DMA or PPP peripheral interrupts are used, the PPP process complete callbacks are called to inform the user about the process completion in real-time event mode (interrupts). Note that the same process completion callbacks are used for DMA in interrupt mode.

3.12.2 HAL initialization

3.12.2.1 HAL global initialization

In addition to the peripheral initialization and de-initialization functions, a set of APIs are provided to initialize the HAL core implemented in file stm32h5xx_hal.c.

- HAL_Init(): this function must be called at application startup to
  - initialize data/instruction cache and pre-fetch queue
  - set SysTick timer to generate an interrupt each 1ms (based on HSI clock) with the lowest priority
  - call HAL_MspInit() user callback function to perform system level initializations (Clock, GPIOs, DMA, interrupts). HAL_MspInit() is defined as “weak” empty function in the HAL drivers.

- HAL_DeInit()
  - resets all peripherals
  - calls function HAL_MspDeInit() which is a user callback function to do system level De-Initalizations.
- HAL_GetTick(): this function gets current SysTick counter value (incremented in SysTick interrupt) used by peripherals drivers to handle timeouts.
- HAL_Delay(). this function implements a delay (expressed in milliseconds) using the SysTick timer.
  Care must be taken when using HAL_Delay() since this function provides an accurate delay (expressed in milliseconds) based on a variable incremented in SysTick ISR. This means that if HAL_Delay() is called from a peripheral ISR, then the SysTick interrupt must have highest priority (numerically lower) than the peripheral interrupt, otherwise the caller ISR is blocked.

3.12.2.2 *System clock initialization*

The clock configuration is done at the beginning of the user code. However the user can change the configuration of the clock in his own code.

Below the typical clock configuration sequence to reach the maximum clock frequency of 250 MHz based on the HSE clock.

```
void SystemClock_Config(void)
{
  RCC_OscInitTypeDef RCC_OscInitStruct = {0};
  RCC_ClkInitTypeDef RCC_ClkInitStruct = {0};

  /** Configure the main internal regulator output voltage
  */
  __HAL_PWR_VOLTAGESCALING_CONFIG(PWR_REGULATOR_VOLTAGE_SCALE0);

  while(!__HAL_PWR_GET_FLAG(PWR_FLAG_VOSRDY)) {}

  /** Initializes the RCC Oscillators according to the specified parameters
    * in the RCC_OscInitTypeDef structure.
    * Configure PLLs :
    * PLL configuration: PLLCLK = (HSE/PLLM * PLLN) / PLLR = (8/4 * 250) / 2 = 250 MHz
    * Enable HSE and activate PLL with HSE as source
    */
  RCC_OscInitStruct.OscillatorType = RCC_OSCILLATORTYPE_HSE;
  RCC_OscInitStruct.HSEState = RCC_HSE_BYPASS_DIGITAL;
  RCC_OscInitStruct.PLL.PLLState = RCC_PLL_ON;
  RCC_OscInitStruct.PLL.PLLSource = RCC_PLLSOURCE_HSE;
  RCC_OscInitStruct.PLL.PLLM = 4;
  RCC_OscInitStruct.PLL.PLLN = 250;
  RCC_OscInitStruct.PLL.PLLP = 2;
  RCC_OscInitStruct.PLL.PLLQ = 2;
  RCC_OscInitStruct.PLL.PLLR = 2;
  RCC_OscInitStruct.PLL.PLLRGE = RCC_PLLVCIRANGE_1;
  RCC_OscInitStruct.PLL.PLLVCOSEL = RCC_PLL1VCOWIDE;
  RCC_OscInitStruct.PLL.PLLFRACN = 0;
  if (HAL_RCC_OscConfig(&RCC_OscInitStruct) != HAL_OK)
  {
    Error_Handler();
  }

  /** Initializes the CPU, AHB and APB buses clocks
  */
  RCC_ClkInitStruct.ClockType = RCC_CLOCKTYPE_HCLK|RCC_CLOCKTYPE_SYSCLK
                              |RCC_CLOCKTYPE_PCLK1|RCC_CLOCKTYPE_PCLK2
                              |RCC_CLOCKTYPE_PCLK3;
  RCC_ClkInitStruct.SYSCLKSource = RCC_SYSCLKSOURCE_PLLCLK;
  RCC_ClkInitStruct.AHBCLKDivider = RCC_SYSCLK_DIV1;
  RCC_ClkInitStruct.APB1CLKDivider = RCC_HCLK_DIV1;
  RCC_ClkInitStruct.APB2CLKDivider = RCC_HCLK_DIV1;
  RCC_ClkInitStruct.APB3CLKDivider = RCC_HCLK_DIV1;

  if (HAL_RCC_ClockConfig(&RCC_ClkInitStruct, FLASH_LATENCY_5) != HAL_OK)
  {
    Error_Handler();
```

```
  }
}
```

3.12.2.3 *HAL MSP initialization process*

The peripheral initialization is done through *HAL_PPP_Init()* while the hardware resources initialization used by a peripheral (PPP) is performed during this initialization by calling MSP callback function *HAL_PPP_MspInit().*

The MspInit callback performs the low level initialization related to the different additional hardware resources: RCC, GPIO, NVIC and DMA.

All the HAL drivers with handles include two MSP callbacks for initialization and de-initialization:

```
/**
* @brief Initializes the PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspInit could be implemented in the user file */
}
/**
* @brief DeInitializes PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspDeInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspDeInit could be implemented in the user file */
}
```

The MSP callbacks are declared empty as weak functions in each peripheral driver. The user can use them to set the low level initialization code or omit them and use his own initialization routine.

The HAL MSP callback is implemented inside the *stm32h5xx_hal_msp.c* file in the user folders. An *stm32h5xx_hal_msp.c* file template is located in the HAL folder and should be copied to the user folder. It can be generated automatically by STM32CubeMX tool and further modified. Note that all the routines are declared as weak functions and could be overwritten or removed to use user low level initialization code.

stm32h5xx_hal_msp.c file contains the following functions:

Table 14. MSP functions

Routine	Description
void HAL_MspInit()	Global MSP initialization routine
void HAL_MspDeInit()	Global MSP de-initialization routine
void HAL_PPP_MspInit()	PPP MSP initialization routine
void HAL_PPP_MspDeInit()	PPP MSP de-initialization routine

By default, if no peripheral needs to be de-initialized during the program execution, the whole MSP initialization is done in *Hal_MspInit()* and MSP De-Initialization in the *Hal_MspDeInit()*. In this case the *HAL_PPP_MspInit()* and *HAL_PPP_MspDeInit()* are not implemented.

When one or more peripherals needs to be de-initialized in run time and the low level resources of a given peripheral need to be released and used by another peripheral, HAL_PPP_MspDeInit() and *HAL_PPP_MspInit()* are implemented for the concerned peripheral and other peripherals initialization and de-Initialization are kept in the global *HAL_MspInit()* and the *HAL_MspDeInit()*.

If there is nothing to be initialized by the global *HAL_MspInit()* and *HAL_MspDeInit()*, the two routines can simply be omitted.

3.12.3 HAL I/O operation process

The HAL functions with internal data processing like transmit, receive, write and read are generally provided with three data processing modes as follows:

- Polling mode
- Interrupt mode

- DMA mode

3.12.3.1 *Polling mode*

In Polling mode, the HAL functions return the process status when the data processing in blocking mode is complete. The operation is considered complete when the function returns the HAL_OK status, otherwise an error status is returned. The user can get more information through the *HAL_PPP_GetState()* function. The data processing is handled internally in a loop. A timeout (expressed in ms) is used to prevent process hanging.

The example below shows the typical Polling mode processing sequence :

```
HAL_StatusTypeDef HAL_PPP_Transmit ( PPP_HandleTypeDef * phandle, uint8_t pData,
int16_tSize,uint32_tTimeout)
{
if((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
(…) while (data processing is running)
{
if( timeout reached )
{
return HAL_TIMEOUT;
}
}
(…)
return HAL_OK; }
```

3.12.3.2 *Interrupt mode*

In Interrupt mode, the HAL function returns the process status after starting the data processing and enabling the appropriate interruption. The end of the operation is indicated by a callback declared as a weak function. It can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function.

In Interrupt mode, four functions are declared in the driver:

- *HAL_PPP_Process_IT()*: launches the process
- *HAL_PPP_IRQHandler()*: global PPP peripheral interruption
- *__weak HAL_PPP_ProcessCpltCallback ()*: callback relative to the process completion.
- *__weak HAL_PPP_ProcessErrorCallback()*: callback relative to the process Error.

To use a process in Interrupt mode, *HAL_PPP_Process_IT()* is called in the user file and HAL_PPP_IRQHandler in *stm32h5xx_it.c.*

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver. This means that the user can declare it again in the application. The function in the driver is not modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_SendIT(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *huart)
{
}
void HAL_UART_ErrorCallback(UART_HandleTypeDef *huart)
{
}
```

*stm32h5xx_it.c*file:

3.12.3.3 DMA mode

In DMA mode, the HAL function returns the process status after starting the data processing through the DMA and after enabling the appropriate DMA interruption. The end of the operation is indicated by a callback declared as a weak function and can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function. For the DMA mode, three functions are declared in the driver:

- *HAL_PPP_Process_DMA()*: launch the process
- *HAL_PPP_DMA_IRQHandler()*: the DMA interruption used by the PPP peripheral
- *__weak HAL_PPP_ProcessCpltCallback()*: the callback relative to the process completion.
- *__weak HAL_PPP_ErrorCpltCallback()*: the callback relative to the process Error.

To use a process in DMA mode, *HAL_PPP_Process_DMA()* is called in the user file and the *HAL_PPP_DMA_IRQHandler()* is placed in the *stm32h5xx_it.c*. When DMA mode is used, the DMA initialization is done in the *HAL_PPP_MspInit()* callback. The user should also associate the DMA handle to the PPP handle. For this purpose, the handles of all the peripheral drivers that use the DMA must be declared as follows:

```
typedef struct
{
PPP_TypeDef *Instance; /* Register base address */
PPP_InitTypeDef Init; /* PPP communication parameters */
HAL_StateTypeDef State; /* PPP communication state */
(…)
DMA_HandleTypeDef *hdma; /* associated DMA handle */
} PPP_HandleTypeDef;
```

The initialization is done as follows (UART example):

```
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = UART1;
HAL_UART_Init(&UartHandle);
(..)
}
void HAL_USART_MspInit (UART_HandleTypeDef * huart)
```

```
{
static DMA_HandleTypeDef hdma_tx;
static DMA_HandleTypeDef hdma_rx;
(…)
__HAL_LINKDMA(UartHandle, DMA_Handle_tx, hdma_tx);
__HAL_LINKDMA(UartHandle, DMA_Handle_rx, hdma_rx);
(…)
}
```

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver that means, the user can declare it again in the application code. The function in the driver should not be modified.

An example of use is illustrated below:

main.c file:

stm32h5xx_it.c file:

```
extern UART_HandleTypeDef UartHandle;
void DMAx_IRQHandler(void)
{
HAL_DMA_IRQHandler(&UartHandle.DMA_Handle_tx);
}
```

HAL_USART_TxCpltCallback() and *HAL_USART_ErrorCallback()* should be linked in the *HAL_PPP_Process_DMA()* function to the DMA transfer complete callback and the DMA transfer Error callback by using the following statement:

```
HAL_PPP_Process_DMA (PPP_HandleTypeDef *hppp, Params….)
{
(…)
hppp->DMA_Handle->XferCpltCallback = HAL_UART_TxCpltCallback ;
hppp->DMA_Handle->XferErrorCallback = HAL_UART_ErrorCallback ;
(…)
}
```

3.12.4 Timeout and error management

3.12.4.1 *Timeout management*

The timeout is often used for the APIs that operate in Polling mode. It defines the delay during which a blocking process should wait till an error is returned. An example is provided below:

```
HAL_StatusTypeDef HAL_DMA_PollForTransfer(DMA_HandleTypeDef *hdma, uint32_t CompleteLevel, ui
nt32_t Timeout)
```

The timeout possible values are the following:

Table 15. Timeout values

Timeout value	Description
0	No poll : Immediate process check and exit
1 ... (HAL_MAX_DELAY -1) (1)	Timeout in ms
HAL_MAX_DELAY	Infinite poll till process is successful

1. *HAL_MAX_DELAY is defined in the stm32h5xx_hal_def.h as 0xFFFFFFFF*

However, in some cases, a fixed timeout is used for system peripherals or internal HAL driver processes. In these cases, the timeout has the same meaning and is used in the same way, except when it is defined locally in the drivers and cannot be modified or introduced as an argument in the user application.

Example of fixed timeout:

```
#define LOCAL_PROCESS_TIMEOUT 100
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef *hppp)
{
  (…)
  tickstart = HAL_GetTick();
  (…)
 while (ProcessOngoing)
  {
    (…)
   if ((HAL_GetTick() - tickstart) > LOCAL_PROCESS_TIMEOUT)
    {
      hppp->ErrorCode |= HAL_PPP_ERROR_TIMEOUT;
      hppp->State= HAL_PPP_STATE_READY;
      return HAL_ERROR;
    }
  }
  (…)
}
```

The following example shows how to use the timeout inside the polling functions:

```
HAL_StatusTypeDef HAL_PPP_Poll(PPP_HandleTypeDef *hppp, uint32_t Timeout)
{
  (…)
  tickstart = HAL_GetTick();
  (…)
 while (ProcessOngoing)
  {
    (…)
   if (((HAL_GetTick() - tickstart) > Timeout) || (Timeout == 0))
    {
      hppp->ErrorCode |= HAL_PPP_ERROR_TIMEOUT;
      hppp->State= HAL_PPP_STATE_READY;
      return HAL_ERROR;
    }
  }
  (…)
}
```

3.12.4.2 *Error management*

The HAL drivers implement a check on the following items:

- Valid parameters: for some process the used parameters should be valid and already defined, otherwise the system may crash or go into an undefined state. These critical parameters are checked before being used (see example below).

```
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef* hppp, uint32_t *pdata, uint32 Size
)
{
if ((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
}
```

- Valid handle: the PPP peripheral handle is the most important argument since it keeps the PPP driver vital parameters. It is always checked in the beginning of the *HAL_PPP_Init()* function.

```
HAL_StatusTypeDef HAL_PPP_Init(PPP_HandleTypeDef* hppp)
{
if (hppp == NULL) //the handle should be already allocated
{
return HAL_ERROR;
}
}
```

- Timeout error: the following statement is used when a timeout error occurs:

```
while (Process ongoing)
{
timeout = HAL_GetTick() + Timeout; while (data processing is running)
{
if(timeout) { return HAL_TIMEOUT;
}
}
```

When an error occurs during a peripheral process, *HAL_PPP_Process ()* returns with a *HAL_ERROR* status. The HAL PPP driver implements the *HAL_PPP_GetError ()* to allow retrieving the origin of the error.

```
HAL_PPP_ErrorTypeDef HAL_PPP_GetError (PPP_HandleTypeDef *hppp);
```

In all peripheral handles, a *HAL_PPP_ErrorTypeDef* is defined and used to store the last error code.

```
typedef struct
{
PPP_TypeDef * Instance; /* PPP registers base address */
PPP_InitTypeDef Init; /* PPP initialization parameters */
HAL_LockTypeDef Lock; /* PPP locking object */
__IO HAL_PPP_StateTypeDef State; /* PPP state */
__IO HAL_PPP_ErrorTypeDef ErrorCode; /* PPP Error code */
(…)
/* PPP specific parameters */
}
PPP_HandleTypeDef;
```

The error state and the peripheral global state are always updated before returning an error:

```
PPP->State = HAL_PPP_READY;  /* Set the peripheral ready */
PP->ErrorCode = HAL_ERRORCODE ; /* Set the error code */
_HAL_UNLOCK(PPP) ; /* Unlock the PPP resources */
return HAL_ERROR;  /*return with HAL error */
```

HAL_PPP_GetError () must be used in interrupt mode in the error callback:

```
void HAL_PPP_ProcessCpltCallback(PPP_HandleTypeDef *hspi)
{
ErrorCode = HAL_PPP_GetError (hppp); /* retreive error code */
}
```

3.12.4.3 *Run-time checking*

The HAL implements run-time failure detection by checking the input values of all HAL driver functions. The run-time checking is achieved by using an *assert_param* macro. This macro is used in all the HAL driver functions which have an input parameter. It allows verifying that the input value lies within the parameter allowed values.

To enable the run-time checking, use the *assert_param* macro, and leave the define ***USE_FULL_ASSERT*** uncommented in *stm32h5xx_hal_conf.h* file.

```
void HAL_UART_Init(UART_HandleTypeDef *huart)
{
(..) /* Check the parameters */
assert_param(IS_UART_INSTANCE(huart->Instance));
assert_param(IS_UART_BAUDRATE(huart->Init.BaudRate));
assert_param(IS_UART_WORD_LENGTH(huart->Init.WordLength));
assert_param(IS_UART_STOPBITS(huart->Init.StopBits));
assert_param(IS_UART_PARITY(huart->Init.Parity));
assert_param(IS_UART_MODE(huart->Init.Mode));
assert_param(IS_UART_HARDWARE_FLOW_CONTROL(huart->Init.HwFlowCtl));
(..)
```

```
/** @defgroup UART_Word_Length *
@{
*/
#define UART_WORDLENGTH_8B ((uint32_t)0x00000000)
#define UART_WORDLENGTH_9B ((uint32_t)USART_CR1_M)
#define IS_UART_WORD_LENGTH(LENGTH) (((LENGTH) == UART_WORDLENGTH_8B) ||
\ ((LENGTH) == UART_WORDLENGTH_9B))
```

If the expression passed to the assert_param macro is false, the*assert_failed* function is called and returns the name of the source file and the source line number of the call that failed. If the expression is true, no value is returned.

The *assert_param* macro is implemented in stm32h5xx_hal_conf.h:

```
/* Exported macro ------------------------------------------------------------*/
#ifdef USE_FULL_ASSERT
/**
* @brief The assert_param macro is used for function's parameters check.
* @param expr: If expr is false, it calls assert_failed function
* which reports the name of the source file and the source
* line number of the call that failed.
* If expr is true, it returns no value.
* @retval None */
#define assert_param(expr) ((expr)?(void)0:assert_failed((uint8_t *)__FILE__, __LINE__))
/* Exported functions ---------------------------------------*/
void assert_failed(uint8_t* file, uint32_t line);
#else
#define assert_param(expr)((void)0)
#endif /* USE_FULL_ASSERT */
```

The *assert_failed* function is implemented in the main.c file or in any other user C file:

```
#ifdef USE_FULL_ASSERT /**
* @brief Reports the name of the source file and the source line number
* where the assert_param error has occurred.
* @param file: pointer to the source file name
* @param line: assert_param error line source number
* @retval None */
void assert_failed(uint8_t* file, uint32_t line)
{
/* User can add his own implementation to report the file name and line number,
ex: printf("Wrong parameters value: file %s on line %d\r\n", file, line) */
/* Infinite loop */
while (1)
{
}
}
```

Attention: ***Because of the overhead run-time checking introduces, it is recommended to use it during application code development and debugging, and to remove it from the final application to improve code size and speed.***

4 Overview of low-layer drivers

The low-layer (LL) drivers are designed to offer a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. Contrary to the HAL, LL APIs are not provided for peripherals where optimized access is not a key feature, or those requiring heavy software configuration and/or complex upper-level stack (such as USB).

The LL drivers feature:

- A set of functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Functions to perform peripheral de-initialization (peripheral registers restored to their default values)
- A set of inline functions for direct and atomic register access
- Full independence from HAL since LL drivers can be used either in standalone mode (without HAL drivers) or in mixed mode (with HAL drivers)
- Full coverage of the supported peripheral features

The low-layer drivers provide hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities and provide one-shot operations that must be called following the programming model described in the microcontroller line reference manual. As a result, the LL services do not implement any processing and do not require any additional memory resources to save their states, counter or data pointers: all the operations are performed by changing the associated peripheral registers content.

4.1 Low-layer files

The low-layer drivers are built around header/C files (one per each supported peripheral) plus five header files for some System and Cortex related features.

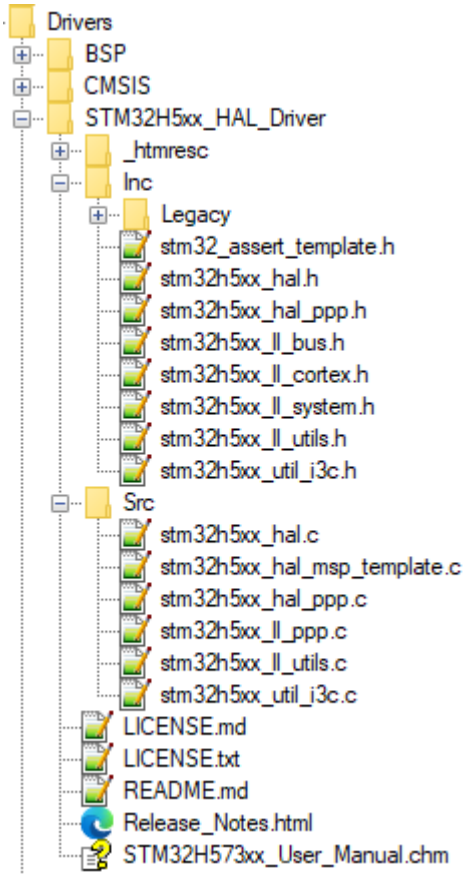
Table 16. LL driver files

File	Description
stm32h5xx_ll_bus.h	This is the h-source file for core bus control and peripheral clock activation and deactivation *Example: LL_AHB2_GRP1_EnableClock*
stm32h5xx_ll_ppp.h/.c	stm32h5xx_ll_ppp.c provides peripheral initialization functions such as LL_PPP_Init(), LL_PPP_StructInit(), LL_PPP_DeInit(). All the other APIs are definined within stm32h5xx_ll_ppp.h file. The low-layer PPP driver is a standalone module. To use it, the application must include it in the stm32h5xx_ll_ppp.h file.
stm32h5xx_ll_cortex.h	Cortex-M related register operation APIs including the Systick, Low power (such as LL_SYSTICK_xxxxx and LL_LPM_xxxxx "Low Power Mode")
stm32h5xx_ll_utils.h/.c	This file covers the generic APIs: • Read of device unique ID and electronic signature • Timebase and delay management • System clock configuration.
stm32h5xx_ll_system.h	System related operations. Example: LL_SBS_xxx, LL_DBGMCU_xxx and LL_FLASH_xxx
stm32_assert_template.h	Template file allowing to define the assert_param macro, that is used when run-time checking is enabled. This file is required only when the LL drivers are used in standalone mode (without calling the HAL APIs). It should be copied to the application folder and renamed to stm32_assert.h.

Note: There is no configuration file for the LL drivers.

The low-layer files are located in the same HAL driver folder.

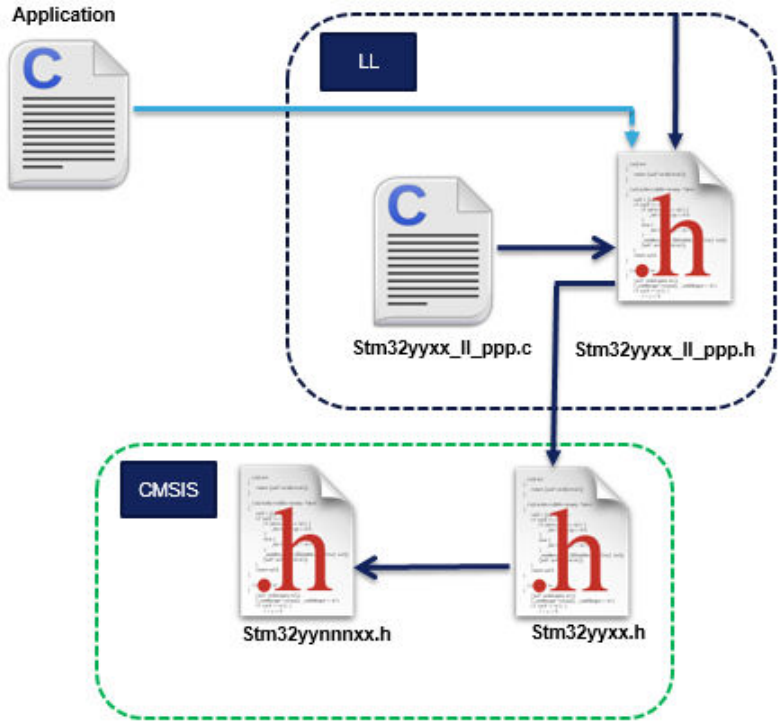
Figure 8. **Low-layer driver folders**



In general, low-layer drivers include only the STM32 CMSIS device file.

```
#include "stm32yyxx.h"
```

Figure 9. **Low-layer driver CMSIS files**



Application files have to include only the used low-layer driver header files.

4.2 Overview of low-layer APIs and naming rules

4.2.1 Peripheral initialization functions

The LL drivers offer three sets of initialization functions. They are defined in stm32h5xx_ll_ppp.c file:

- Functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Function for peripheral de-initialization (peripheral registers restored to their default values)

The definition of these LL initialization functions and associated resources (structure, literals and prototypes) is conditioned by a compilation switch: *USE_FULL_LL_DRIVER*. To use these functions, this switch must be added in the toolchain compiler preprocessor or to any generic header file which is processed before the LL drivers.

The below table shows the list of the common functions provided for all the supported peripherals:

Table 17. Common peripheral initialization functions

Functions	Return Type	Parameters	Description
LL_PPP_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_InitTypeDef* PPP_InitStruct*	Initializes the peripheral main features according to the parameters specified in PPP_InitStruct. Example: LL_USART_Init(USART_TypeDef *USARTx, LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_StructInit	*void*	• *LL_PPP_InitTypeDef* PPP_InitStruct*	Fills each PPP_InitStruct member with its default value. Example. LL_USART_StructInit(LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_DeInit	*ErrorStatus*	• *PPP_TypeDef* PPPx*	De-initializes the peripheral registers, that is restore them to their default reset values. Example. LL_USART_DeInit(USART_TypeDef *USARTx)

Additional functions are available for some peripherals (refer to Table 18. Optional peripheral initialization functions).

Table 18. Optional peripheral initialization functions

Functions	Return Type	Parameters	Examples
LL_PPP{_CATEGORY}_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Initializes peripheral features according to the parameters specified in PPP_InitStruct. Example: LL_ADC_INJ_Init(ADC_TypeDef *ADCx, LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct) LL_RTC_TIME_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_TimeTypeDef *RTC_TimeStruct) LL_RTC_DATE_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_DateTypeDef *RTC_DateStruct) LL_TIM_IC_Init(TIM_TypeDef* TIMx, uint32_t Channel, LL_TIM_IC_InitTypeDef* TIM_IC_InitStruct) LL_TIM_ENCODER_Init(TIM_TypeDef* TIMx, LL_TIM_ENCODER_InitTypeDef* TIM_EncoderInitStruct)
LL_PPP{_CATEGORY}_StructInit	*void*	*LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Fills each *PPP{_CATEGORY}_InitStruct* member with its default value. Example: LL_ADC_INJ_StructInit(LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct)
LL_PPP_CommonInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Initializes the common features shared between different instances of the same peripheral. Example: LL_ADC_CommonInit(ADC_Common_TypeDef *ADCxy_COMMON, LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_CommonStructInit	*void*	*LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Fills each *PPP_CommonInitStruct* member with its default value Example: LL_ADC_CommonStructInit(LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_ClockInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Initializes the peripheral clock configuration in synchronous mode. Example: LL_USART_ClockInit(USART_TypeDef *USARTx, LL_USART_ClockInitTypeDef *USART_ClockInitStruct)

Functions	Return Type	Parameters	Examples
LL_PPP_ClockStructInit	*void*	*LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Fills each *PPP_ClockInitStruct* member with its default value Example: LL_USART_ClockStructInit(LL_USART_ClockInitTypeDef *USART_ClockInitStruct)

4.2.1.1 *Run-time checking*

Like HAL drivers, LL initialization functions implement run-time failure detection by checking the input values of all LL driver functions. For more details, refer to Section 3.12.4.3 Run-time checking.

When using the LL drivers in standalone mode (without calling HAL functions), the following actions are required to use run-time checking:

1. Copy stm32_assert_template.h to the application folder and rename it to stm32_assert.h. This file defines the assert_param macro which is used when run-time checking is enabled.
2. Include stm32_assert.h file within the application main header file.
3. Add the USE_FULL_ASSERT compilation switch in the toolchain compiler preprocessor or in any generic header file which is processed before the stm32_assert.h driver.

Note: Run-time checking is not available for LL inline functions.

4.2.2 Peripheral register-level configuration functions

On top of the peripheral initialization functions, the LL drivers offer a set of inline functions for direct atomic register access. Their format is as follows:

```
__STATIC_INLINE return_type LL_PPP_Function (PPPx_TypeDef *PPPx, args)
```

The “Function” naming is defined depending to the action category:

- **Specific Interrupt, DMA request and status flags management**: Set/Get/Clear/Enable/Disable flags on interrupt and status registers

Table 19. Specific Interrupt, DMA request and status flags management

Name	Examples
LL_PPP_{_CATEGORY}_ActionItem_BITNAME *LL_PPP{_CATEGORY}_IsItem_BITNAME_Action*	• LL_RCC_IsActiveFlag_LSIRDY • LL_RCC_IsActiveFlag_FWRST() • LL_ADC_ClearFlag_EOC(ADC1) • LL_DMA_ClearFlag_TCx(DMA_TypeDef* DMAx)

Table 20. Available function formats

Item	Action	Format
Flag	Get	*LL_PPP_IsActiveFlag_BITNAME*
	Clear	*LL_PPP_ClearFlag_BITNAME*
Interrupts	Enable	*LL_PPP_EnableIT_BITNAME*
	Disable	*LL_PPP_DisableIT_BITNAME*
	Get	*LL_PPP_IsEnabledIT_BITNAME*
DMA	Enable	*LL_PPP_EnableDMAReq_BITNAME*
	Disable	*LL_PPP_DisableDMAReq_BITNAME*
	Get	*LL_PPP_IsEnabledDMAReq_BITNAME*

Note: BITNAME refers to the peripheral register bit name as described in the product line reference manual.

- **Peripheral clock activation/deactivation management**: Enable/Disable/Reset a peripheral clock

Table 21. Peripheral clock activation/deactivation management

Name	Examples
LL_BUS_GRPx_ActionClock{Mode}	• *LL_AHB2_GRP1_EnableClock (LL_AHB2_GRP1_PERIPH_GPIOA| LL_AHB2_GRP1_PERIPH_GPIOB)* • *LL_APB1_GRP1_EnableClockSleep (LL_APB1_GRP1_PERIPH_DAC1)*

Note: 'x' corresponds to the group index and refers to the index of the modified register on a given bus. 'bus' corresponds to the bus name.

- ***Peripheral activation/deactivation management*** : Enable/disable a peripheral or activate/deactivate specific peripheral features

Table 22. Peripheral activation/deactivation management

Name	Examples
LL_PPP{_CATEGORY}_Action{Item} *LL_PPP{_CATEGORY}_IsItemAction*	• *LL_ADC_Enable ()* • *LL_ADC_StartCalibration();* • *LL_ADC_IsCalibrationOnGoing;* • *LL_RCC_HSI_Enable ()* • *LL_RCC_HSI_IsReady()*

- ***Peripheral configuration management*** : Set/get a peripheral configuration settings

Table 23. Peripheral configuration management

Name	Examples
LL_PPP{_CATEGORY}_Set{ or Get}ConfigItem	*LL_USART_SetBaudRate (USART2, Clock, LL_USART_BAUDRATE_9600)*

- ***Peripheral register management*** : Write/read the content of a register/retrun DMA relative register address

Table 24. Peripheral register management

Name
LL_PPP_WriteReg(__INSTANCE__, __REG__, __VALUE__)
LL_PPP_ReadReg(__INSTANCE__, __REG__)
*LL_PPP_DMA_GetRegAddr (PPP_TypeDef *PPPx,{Sub Instance if any ex: Channel} , {uint32_t Propriety})*

Note: The Propriety is a variable used to identify the DMA transfer direction or the data register type.

5 Cohabiting of HAL and LL

The low-ayer APIs are designed to be used in standalone mode or combined with the HAL. They cannot be automatically used with the HAL for the same peripheral instance. If you use the LL APIs for a specific instance, you can still use the HAL APIs for other instances. Be careful that the low-layer APIs might overwrite some registers which content is mirrored in the HAL handles.

5.1 Low-layer driver used in Standalone mode

The low-layer APIs can be used without calling the HAL driver services. This is done by simply including stm32h5xx_ll_ppp.h in the application files. The LL APIs for a given peripheral are called by executing the same sequence as the one recommended by the programming model in the corresponding product line reference manual. In this case the HAL drivers associated to the used peripheral can be removed from the workspace. However the STM32CubeH5 framework should be used in the same way as in the HAL drivers case which means that System file, startup file and CMSIS should always be used.

Note: When the BSP drivers are included, the used HAL drivers associated with the BSP functions drivers should be included in the workspace, even if they are not used by the application layer.

5.2 Mixed use of low-layer APIs and HAL drivers

In this case the low-layer APIs are used in conjunction with the HAL drivers to achieve direct and register level based operations.

Mixed use is allowed, however some consideration should be taken into account:

- It is recommended to avoid using simultaneously the HAL APIs and the combination of low-layer APIs for a given peripheral instance. If this is the case, one or more private fields in the HAL PPP handle structure should be updated accordingly.
- For operations and processes that do not alter the handle fields including the initialization structure, the HAL driver APIs and the low-layer services can be used together for the same peripheral instance.
- The low-layer drivers can be used without any restriction with all the HAL drivers that are not based on handle objects (RCC, common HAL, Flash and GPIO).

Several examples showing how to use HAL and LL in the same application are provided within stm32h5 firmware package (refer to Examples_MIX projects).

Note:

1. *When the HAL Init/DeInit APIs are not used and are replaced by the low-layer macros, the InitMsp() functions are not called and the MSP initialization should be done in the user application.*
2. *When process APIs are not used and the corresponding function is performed through the low-layer APIs, the callbacks are not called and post processing or error management should be done by the user application.*
3. *When the LL APIs is used for process operations, the IRQ handler HAL APIs cannot be called and the IRQ should be implemented by the user application. Each LL driver implements the macros needed to read and clear the associated interrupt flags.*

6 HAL System Driver

6.1 HAL Firmware driver API description

The following section lists the various functions of the HAL library.

6.1.1 How to use this driver

The common HAL driver contains a set of generic and common APIs that can be used by the PPP peripheral drivers and the user to start using the HAL.

The HAL contains two APIs' categories:

- Common HAL APIs
- Services HAL APIs

6.1.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initializes the Flash interface the NVIC allocation and initial clock configuration. It initializes the systick also when timeout is needed and the backup domain when enabled.
- De-Initializes common part of the HAL.
- Configure The time base source to have 1ms time base with a dedicated Tick interrupt priority.
  - SysTick timer is used by default as source of time base, but user can eventually implement his proper time base source (a general purpose timer for example or other time source), keeping in mind that Time base duration should be kept 1ms since PPP_TIMEOUT_VALUEs are defined and handled in milliseconds basis.
  - Time base configuration function (HAL_InitTick ()) is called automatically at the beginning of the program after reset by HAL_Init() or at any time when clock is configured, by HAL_RCC_ClockConfig().
  - Source of time base is configured to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, the Tick interrupt line must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked.
  - functions affecting time base configurations are declared as __weak to make override possible in case of other implementations in user file.

This section contains the following APIs:

- ***HAL_Init()***
- ***HAL_DeInit()***
- ***HAL_MspInit()***
- ***HAL_MspDeInit()***
- ***HAL_InitTick()***

6.1.3 HAL Control functions

This section provides functions allowing to:

- Provide a tick value in millisecond
- Provide a blocking delay in millisecond
- Suspend the time base source interrupt
- Resume the time base source interrupt
- Get the HAL API driver version
- Get the device identifier
- Get the device revision identifier

This section contains the following APIs:

- ***HAL_IncTick()***
- ***HAL_GetTick()***

- *HAL_GetTickPrio()*
- *HAL_SetTickFreq()*
- *HAL_GetTickFreq()*
- *HAL_Delay()*
- *HAL_SuspendTick()*
- *HAL_ResumeTick()*
- *HAL_GetHalVersion()*
- *HAL_GetREVID()*
- *HAL_GetDEVID()*
- *HAL_GetUIDw0()*
- *HAL_GetUIDw1()*
- *HAL_GetUIDw2()*

6.1.4 HAL Debug functions

This section provides functions allowing to:

- Enable/Disable Debug module during STOP mode
- Enable/Disable Debug module during STANDBY mode

This section contains the following APIs:

- *HAL_DBGMCU_EnableDBGStopMode()*
- *HAL_DBGMCU_DisableDBGStopMode()*
- *HAL_DBGMCU_EnableDBGStandbyMode()*
- *HAL_DBGMCU_DisableDBGStandbyMode()*

6.1.5 HAL VREFBUF Control functions

This section provides functions allowing to:

- Configure the Voltage reference buffer
- Enable/Disable the Voltage reference buffer

This section contains the following APIs:

- *HAL_VREFBUF_VoltageScalingConfig()*
- *HAL_VREFBUF_HighImpedanceConfig()*
- *HAL_VREFBUF_TrimmingConfig()*
- *HAL_EnableVREFBUF()*
- *HAL_DisableVREFBUF()*

6.1.6 HAL SBS configuration functions

This section provides functions allowing to:

- Select the Ethernet PHY Interface
- Enable/Disable the VDD I/Os Compensation Cell
- Code selection/configuration for the VDD I/O Compensation cell
- Get ready flag status of VDD I/Os Compensation cell
- Get PMOS/NMOS compensation value of the I/Os supplied by VDD
- Enable/Disable the NMI in case of double ECC error in FLASH Interface

This section contains the following APIs:

- *HAL_SBS_ETHInterfaceSelect()*
- *HAL_SBS_EnableVddIO1CompensationCell()*
- *HAL_SBS_DisableVddIO1CompensationCell()*
- *HAL_SBS_EnableVddIO2CompensationCell()*
- *HAL_SBS_DisableVddIO2CompensationCell()*
- *HAL_SBS_VDDCompensationCodeSelect()*

- *HAL_SBS_VDDIOCompensationCodeSelect()*
- *HAL_SBS_GetVddIO1CompensationCellReadyFlag()*
- *HAL_SBS_GetVddIO2CompensationCellReadyFlag()*
- *HAL_SBS_VDDCompensationCodeConfig()*
- *HAL_SBS_VDDIOCompensationCodeConfig()*
- *HAL_SBS_GetNMOSVddCompensationValue()*
- *HAL_SBS_GetPMOSVddCompensationValue()*
- *HAL_SBS_GetNMOSVddIO2CompensationValue()*
- *HAL_SBS_GetPMOSVddIO2CompensationValue()*
- *HAL_SBS_FLASH_DisableECCNMI()*
- *HAL_SBS_FLASH_EnableECCNMI()*
- *HAL_SBS_FLASH_ECCNMI_IsDisabled()*

6.1.7 HAL SBS Boot control functions

This section provides functions allowing to:

- Increment the HDPL value
- Get the HDPL value

This section contains the following APIs:

- *HAL_SBS_IncrementHDPLValue()*
- *HAL_SBS_GetHDPLValue()*

6.1.8 HAL SBS Hardware secure storage control functions

This section provides functions allowing to:

- Select EPOCH security sent to SAES IP
- Set/Get EPOCH security selection
- Set/Get the OBK-HDPL Value

This section contains the following APIs:

- *HAL_SBS_EPOCHSelection()*
- *HAL_SBS_GetEPOCHSelection()*
- *HAL_SBS_SetOBKHDPL()*
- *HAL_SBS_GetOBKHDPL()*

6.1.9 SBS Debug control functions

This section provides functions allowing to:

- Open the device access port
- Open the debug
- Configure the authenticated debug HDPL
- Get the current value of the hide protection level
- Lock the access to the debug control register
- Configure/Get the authenticated debug security access

This section contains the following APIs:

- *HAL_SBS_OpenAccessPort()*
- *HAL_SBS_OpenDebug()*
- *HAL_SBS_ConfigDebugLevel()*
- *HAL_SBS_GetDebugLevel()*
- *HAL_SBS_LockDebugConfig()*
- *HAL_SBS_ConfigDebugSecurity()*
- *HAL_SBS_GetDebugSecurity()*

6.1.10 SBS lock functions

This section contains the following APIs:

- *HAL_SBS_Lock()*
- *HAL_SBS_GetLock()*

6.1.11 SBS attributes functions

This section contains the following APIs:

- *HAL_SBS_ConfigAttributes()*
- *HAL_SBS_GetConfigAttributes()*

6.1.12 Detailed description of functions

HAL_Init

Function name

HAL_StatusTypeDef HAL_Init (void)

Function description

Configure the Flash prefetch, the time base source, NVIC and any required global low level hardware by calling the HAL_MspInit() callback function to be optionally defined in user file stm32h5xx_hal_msp.c.

Return values

- **HAL:** status

Notes

- HAL_Init() function is called at the beginning of program after reset and before the clock configuration.
- In the default implementation the System Timer (Systick) is used as source of time base. The Systick configuration is based on HSI clock, as HSI is the clock used after a system Reset and the NVIC configuration is set to Priority group 4. Once done, time base tick starts incrementing: the tick variable counter is incremented each 1ms in the SysTick_Handler() interrupt handler.

HAL_DeInit

Function name

HAL_StatusTypeDef HAL_DeInit (void)

Function description

This function de-Initializes common part of the HAL and stops the systick.

Return values

- **HAL:** status

HAL_MspInit

Function name

void HAL_MspInit (void)

Function description

Initializes the MSP.

Return values

- **None:**

HAL_MspDeInit

Function name

void HAL_MspDeInit (void)

Function description

DeInitializes the MSP.

Return values

- **None:**

HAL_InitTick

Function name

HAL_StatusTypeDef HAL_InitTick (uint32_t TickPriority)

Function description

This function configures the source of the time base.

Parameters

- **TickPriority:** Tick interrupt priority.

Return values

- **HAL:** status

Notes

- This function is called automatically at the beginning of program after reset by HAL_Init() or at any time when clock is reconfigured by HAL_RCC_ClockConfig().
- In the default implementation, SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, The SysTick interrupt must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked. The function is declared as __weak to be overwritten in case of other implementation in user file.

HAL_IncTick

Function name

void HAL_IncTick (void)

Function description

This function is called to increment a global variable "uwTick" used as application time base.

Return values

- **None:**

Notes

- In the default implementation, this variable is incremented each 1ms in Systick ISR.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_Delay

Function name

void HAL_Delay (uint32_t Delay)

Function description

This function provides minimum delay (in milliseconds) based on variable incremented.

Parameters

- **Delay:** specifies the delay time length, in milliseconds.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals where uwTick is incremented.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTick

Function name

uint32_t HAL_GetTick (void)

Function description

Provides a tick value in millisecond.

Return values

- **tick:** value

Notes

- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTickPrio

Function name

uint32_t HAL_GetTickPrio (void)

Function description

This function returns a tick priority.

Return values

- **tick:** priority

HAL_SetTickFreq

Function name

HAL_StatusTypeDef HAL_SetTickFreq (HAL_TickFreqTypeDef Freq)

Function description

Set new tick Freq.

Return values

- **HAL:** status

HAL_GetTickFreq

Function name

HAL_TickFreqTypeDef HAL_GetTickFreq (void)

Function description

Return tick frequency.

Return values

- **Tick:** frequency. Value of HAL_TickFreqTypeDef.

HAL_SuspendTick

Function name

void HAL_SuspendTick (void)

Function description

Suspend Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_SuspendTick() is called, the SysTick interrupt will be disabled and so Tick increment is suspended.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_ResumeTick

Function name

void HAL_ResumeTick (void)

Function description

Resume Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_ResumeTick() is called, the SysTick interrupt will be enabled and so Tick increment is resumed.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetHalVersion

Function name

uint32_t HAL_GetHalVersion (void)

Function description

Returns the HAL revision.

Return values

- **version:** : 0xXYZR (8bits for each decimal, R for RC)

HAL_GetREVID

Function name

uint32_t HAL_GetREVID (void)

Function description

Returns the device revision identifier.

Return values

- **Device:** revision identifier

HAL_GetDEVID

Function name

uint32_t HAL_GetDEVID (void)

Function description

Returns the device identifier.

Return values

- **Device:** identifier

HAL_GetUIDw0

Function name

uint32_t HAL_GetUIDw0 (void)

Function description

Return the first word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_GetUIDw1

Function name

uint32_t HAL_GetUIDw1 (void)

Function description

Return the second word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_GetUIDw2

Function name

uint32_t HAL_GetUIDw2 (void)

Function description

Return the third word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_DBGMCU_EnableDBGStopMode

Function name

void HAL_DBGMCU_EnableDBGStopMode (void)

Function description

Enable the Debug Module during STOP mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStopMode

Function name

void HAL_DBGMCU_DisableDBGStopMode (void)

Function description

Disable the Debug Module during STOP mode.

Return values

- **None:**

HAL_DBGMCU_EnableDBGStandbyMode

Function name

void HAL_DBGMCU_EnableDBGStandbyMode (void)

Function description

Enable the Debug Module during STANDBY mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStandbyMode

Function name

void HAL_DBGMCU_DisableDBGStandbyMode (void)

Function description

Disable the Debug Module during STANDBY mode.

Return values

- **None:**

HAL_VREFBUF_VoltageScalingConfig

Function name

void HAL_VREFBUF_VoltageScalingConfig (uint32_t VoltageScaling)

Function description

Configure the internal voltage reference buffer voltage scale.

Parameters

- **VoltageScaling:** specifies the output voltage to achieve This parameter can be one of the following values:
  - VREFBUF_VOLTAGE_SCALE0: VREF_OUT1 around 2.5 V. This requires VDDA equal to or higher than 2.8 V.
  - VREFBUF_VOLTAGE_SCALE1: VREF_OUT2 around 2.048 V. This requires VDDA equal to or higher than 2.4 V.
  - VREFBUF_VOLTAGE_SCALE2: VREF_OUT3 around 1.8 V. This requires VDDA equal to or higher than 2.1 V.
  - VREFBUF_VOLTAGE_SCALE3: VREF_OUT4 around 1.5 V. This requires VDDA equal to or higher than 1.8 V.

Return values

- **None:**

HAL_VREFBUF_HighImpedanceConfig

Function name

void HAL_VREFBUF_HighImpedanceConfig (uint32_t Mode)

Function description

Configure the internal voltage reference buffer high impedance mode.

Parameters

- **Mode:** specifies the high impedance mode This parameter can be one of the following values:
  - VREFBUF_HIGH_IMPEDANCE_DISABLE: VREF+ pin is internally connect to VREFINT output.
  - VREFBUF_HIGH_IMPEDANCE_ENABLE: VREF+ pin is high impedance.

Return values

- **None:**

HAL_VREFBUF_TrimmingConfig

Function name

void HAL_VREFBUF_TrimmingConfig (uint32_t TrimmingValue)

Function description

Tune the Internal Voltage Reference buffer (VREFBUF).

Return values

- **None:**

HAL_EnableVREFBUF

Function name

HAL_StatusTypeDef HAL_EnableVREFBUF (void)

Function description

Enable the Internal Voltage Reference buffer (VREFBUF).

Return values

- **HAL_OK/HAL_TIMEOUT:**

HAL_DisableVREFBUF

Function name

void HAL_DisableVREFBUF (void)

Function description

Disable the Internal Voltage Reference buffer (VREFBUF).

Return values

- **None:**

HAL_SBS_ETHInterfaceSelect

Function name

void HAL_SBS_ETHInterfaceSelect (uint32_t SBS_ETHInterface)

Function description

Ethernet PHY Interface Selection either MII or RMII.

Parameters

- **SBS_ETHInterface:** Selects the Ethernet PHY interface This parameter can be one of the following values:
  - SBS_ETH_MII : Select the Media Independent Interface
  - SBS_ETH_RMII: Select the Reduced Media Independent Interface

Return values

- **None:**

HAL_SBS_EnableVddIO1CompensationCell

Function name

void HAL_SBS_EnableVddIO1CompensationCell (void)

Function description

Enables the VDD I/Os Compensation Cell.

Return values

- **None:**

Notes

- The I/O compensation cell can be used only when the device supply voltage ranges from 2.4 to 3.6 V.

HAL_SBS_DisableVddIO1CompensationCell

Function name

void HAL_SBS_DisableVddIO1CompensationCell (void)

Function description

Power-down the VDD I/Os Compensation Cell.

Return values

- **None:**

Notes

- The I/O compensation cell can be used only when the device supply voltage ranges from 2.4 to 3.6 V.

HAL_SBS_EnableVddIO2CompensationCell

Function name

void HAL_SBS_EnableVddIO2CompensationCell (void)

Function description

Enables the VDDIO2 I/Os Compensation Cell.

Return values

- **None:**

Notes

- The I/O compensation cell can be used only when the device supply voltage ranges from 2.4 to 3.6 V.

HAL_SBS_DisableVddIO2CompensationCell

Function name

void HAL_SBS_DisableVddIO2CompensationCell (void)

Function description

Power-down the VDDIO2 I/Os Compensation Cell.

Return values

- **None:**

Notes

- The I/O compensation cell can be used only when the device supply voltage ranges from 2.4 to 3.6 V.

HAL_SBS_VDDCompensationCodeSelect

Function name

void HAL_SBS_VDDCompensationCodeSelect (uint32_t SBS_CompCode)

Function description

Code selection for the VDD I/O Compensation cell.

Parameters

- **SBS_CompCode:** Selects the code to be applied for the I/O compensation cell This parameter can be one of the following values:
  - SBS_VDD_CELL_CODE : Select Code from the cell (available in the SBS_CCVALR)
  - SBS_VDD_REGISTER_CODE: Select Code from the SBS compensation cell code register (SBS_CCSWCR)

Return values

- **None:**

HAL_SBS_VDDIOCompensationCodeSelect

Function name

void HAL_SBS_VDDIOCompensationCodeSelect (uint32_t SBS_CompCode)

Function description

Code selection for the VDDIO I/O Compensation cell.

Parameters

- **SBS_CompCode:** Selects the code to be applied for the I/O compensation cell This parameter can be one of the following values:
  - SBS_VDDIO_CELL_CODE : Select Code from the cell (available in the SBS_CCVALR)
  - SBS_VDDIO_REGISTER_CODE: Select Code from the SBS compensation cell code register (SBS_CCSWCR)

Return values

- **None:**

HAL_SBS_GetVddIO1CompensationCellReadyFlag

Function name

uint32_t HAL_SBS_GetVddIO1CompensationCellReadyFlag (void)

Function description

VDDIO1 I/O Compensation cell get ready flag status.

Return values

- **State:** of bit (1 or 0).

HAL_SBS_GetVddIO2CompensationCellReadyFlag

Function name

uint32_t HAL_SBS_GetVddIO2CompensationCellReadyFlag (void)

Function description

VDDIO2 I/O Compensation cell get ready flag status.

Return values

- **State:** of bit (1 or 0).

HAL_SBS_VDDCompensationCodeConfig

Function name

void HAL_SBS_VDDCompensationCodeConfig (uint32_t SBS_PMOSCode, uint32_t SBS_NMOSCode)

Function description

Code configuration for the VDD I/O Compensation cell.

Parameters

- **SBS_PMOSCode:** PMOS compensation code This code is applied to the VDD I/O compensation cell when the CS1 bit of the SBS_CCSR is set
- **SBS_NMOSCode:** NMOS compensation code This code is applied to the VDD I/O compensation cell when the CS1 bit of the SBS_CCSR is set

Return values

- **None:**

HAL_SBS_VDDIOCompensationCodeConfig

Function name

void HAL_SBS_VDDIOCompensationCodeConfig (uint32_t SBS_PMOSCode, uint32_t SBS_NMOSCode)

Function description

Code configuration for the VDDIO I/O Compensation cell.

Parameters

- **SBS_PMOSCode:** PMOS compensation code This code is applied to the VDDIO I/O compensation cell when the CS2 bit of the SBS_CCSR is set
- **SBS_NMOSCode:** NMOS compensation code This code is applied to the VDDIO I/O compensation cell when the CS2 bit of the SBS_CCSR is set

Return values

- **None:**

HAL_SBS_GetNMOSVddCompensationValue

Function name

uint32_t HAL_SBS_GetNMOSVddCompensationValue (void)

Function description

Get NMOS compensation value of the I/Os supplied by VDD.

Return values

- **None:**

HAL_SBS_GetPMOSVddCompensationValue

Function name

uint32_t HAL_SBS_GetPMOSVddCompensationValue (void)

Function description

Get PMOS compensation value of the I/Os supplied by VDD.

Return values

- **None:**

HAL_SBS_GetNMOSVddIO2CompensationValue

Function name

uint32_t HAL_SBS_GetNMOSVddIO2CompensationValue (void)

Function description

Get NMOS compensation value of the I/Os supplied by VDDIO2.

Return values

- **None:**

HAL_SBS_GetPMOSVddIO2CompensationValue

Function name

uint32_t HAL_SBS_GetPMOSVddIO2CompensationValue (void)

Function description

Get PMOS compensation value of the I/Os supplied by VDDIO2.

Return values

- **None:**

HAL_SBS_FLASH_EnableECCNMI

Function name

void HAL_SBS_FLASH_EnableECCNMI (void)

Function description

Enable the NMI in case of double ECC error in FLASH Interface.

Return values

- **None:**

HAL_SBS_FLASH_DisableECCNMI

Function name

void HAL_SBS_FLASH_DisableECCNMI (void)

Function description

Disable the NMI in case of double ECC error in FLASH Interface.

Return values

- **None:**

HAL_SBS_FLASH_ECCNMI_IsDisabled

Function name

uint32_t HAL_SBS_FLASH_ECCNMI_IsDisabled (void)

Function description

Check if the NMI is Enabled in case of double ECC error in FLASH Interface.

Return values

- **State:** of bit (1 or 0).

HAL_SBS_IncrementHDPLValue

Function name

void HAL_SBS_IncrementHDPLValue (void)

Function description

Increment by 1 the HDPL value.

Return values

- **None:**

HAL_SBS_GetHDPLValue

Function name

uint32_t HAL_SBS_GetHDPLValue (void)

Function description

Get the HDPL Value.

Return values

- **Returns:** the HDPL value This return value can be one of the following values:
  - SBS_HDPL_VALUE_0: HDPL0
  - SBS_HDPL_VALUE_1: HDPL1
  - SBS_HDPL_VALUE_2: HDPL2
  - SBS_HDPL_VALUE_3: HDPL3

HAL_SBS_EPOCHSelection

Function name

void HAL_SBS_EPOCHSelection (uint32_t Epoch_Selection)

Function description

Select EPOCH security sent to SAES IP to encrypt/decrypt keys.

Parameters

- **Epoch_Selection:** Select EPOCH security This parameter can be one of the following values:
  - SBS_EPOCH_SEL_SECURE : EPOCH secure selected.
  - SBS_EPOCH_SEL_NONSECURE : EPOCH non secure selected.
  - SBS_EPOCH_SEL_PUFCHECK : EPOCH all zeros for PUF integrity check.

Return values

- **None:**

HAL_SBS_GetEPOCHSelection

Function name

uint32_t HAL_SBS_GetEPOCHSelection (void)

Function description

Get EPOCH security selection.

Return values

- **Returned:** value can be one of the following values:
  - SBS_EPOCH_SEL_SECURE : EPOCH secure selected.
  - SBS_EPOCH_SEL_NONSECURE : EPOCH non secure selected.
  - SBS_EPOCH_SEL_PUFCHECK : EPOCH all zeros for PUF integrity check.

HAL_SBS_SetOBKHDPL

Function name

void HAL_SBS_SetOBKHDPL (uint32_t OBKHDPL_Value)

Function description

Set the OBK-HDPL Value.

Parameters

- **OBKHDPL_Value:** Value of the increment to add to HDPL value to generate the OBK-HDPL. This parameter can be one of the following values:
  - SBS_OBKHDPL_INCR_0 : HDPL
  - SBS_OBKHDPL_INCR_1 : HDPL + 1
  - SBS_OBKHDPL_INCR_2 : HDPL + 2
  - SBS_OBKHDPL_INCR_3 : HDPL + 3

Return values

- **None:**

HAL_SBS_GetOBKHDPL

Function name

uint32_t HAL_SBS_GetOBKHDPL (void)

Function description

Get the OBK-HDPL Value.

Return values

- **Returns:** the incremement to add to HDPL value to generate OBK-HDPL This return value can be one of the following values:
  - SBS_OBKHDPL_INCR_0: HDPL
  - SBS_OBKHDPL_INCR_1: HDPL + 1
  - SBS_OBKHDPL_INCR_2: HDPL + 2
  - SBS_OBKHDPL_INCR_3: HDPL + 3

HAL_SBS_OpenAccessPort

Function name

void HAL_SBS_OpenAccessPort (void)

Function description

Open the device access port.

Return values

- **None:**

Notes

- This function can be only used when device state is Closed.

HAL_SBS_OpenDebug

Function name

void HAL_SBS_OpenDebug (void)

Function description

Open the debug when the hide protection level is authorized.

Return values

- **None:**

Notes

- This function can be only used when device state is Closed.

HAL_SBS_ConfigDebugLevel

Function name

HAL_StatusTypeDef HAL_SBS_ConfigDebugLevel (uint32_t Level)

Function description

Configure the authenticated debug hide protection level.

Parameters

- **Level:** Hide protection level where the authenticated debug opens This value is one of HDPL Value (except SBS_HDPL_VALUE_0)

Return values

- **HAL_OK:** if parameter is correct HAL_ERROR otherwise

Notes

- This function can be only used when device state is Closed.

HAL_SBS_GetDebugLevel

Function name

uint32_t HAL_SBS_GetDebugLevel (void)

Function description

Get the current value of the hide protection level.

Return values

- **Current:** hide protection level This value is one of HDPL Value

Notes

- This function can be only used when device state is Closed.

HAL_SBS_LockDebugConfig

Function name

void HAL_SBS_LockDebugConfig (void)

Function description

Lock the access to the debug control register.

Return values

- **None:**

Notes

- This function can be only used when device state is Closed.
- locking the current debug configuration is released only by a reset.

HAL_SBS_ConfigDebugSecurity

Function name

void HAL_SBS_ConfigDebugSecurity (uint32_t Security)

Function description

Configure the authenticated debug security access.

Parameters

- **Control:** debug opening secure/non-secure or non-secure only This parameter can be one of the following values:
  - SBS_DEBUG_SEC_NSEC: debug opening for secure and non-secure.
  - SBS_DEBUG_NSEC: debug opening for non-secure only.

Return values

- **None:**

HAL_SBS_GetDebugSecurity

Function name

uint32_t HAL_SBS_GetDebugSecurity (void)

Function description

Get the current value of the hide protection level.

Return values

- **Returned:** value can be one of the following values:
  - SBS_DEBUG_SEC_NSEC: debug opening for secure and non-secure.
  - SBS_DEBUG_NSEC: debug opening for non-secure only.

Notes

- This function can be only used when device state is Closed.

HAL_SBS_Lock

Function name

void HAL_SBS_Lock (uint32_t Item)

Function description

Lock the SBS item(s).

Parameters

- **Item:** Item(s) to set lock on. This parameter can be a combination of SBS Lock items

Return values

- **None:**

Notes

- Setting lock(s) depends on privilege mode in secure/non-secure code Lock(s) cleared only at system reset

HAL_SBS_GetLock

Function name

HAL_StatusTypeDef HAL_SBS_GetLock (uint32_t * pItem)

Function description

Get the lock state of SBS items.

Parameters

- **pItem:** pointer to return locked items the return value can be a combination of SBS Lock items

Return values

- **HAL:** status

Notes

- Getting lock(s) depends on privilege mode in secure/non-secure code

HAL_SBS_ConfigAttributes

Function name

void HAL_SBS_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the SBS item attribute(s).

Parameters

- **Item:** Item(s) to set attributes on. This parameter can be a one or a combination of SBS Attributes items
- **Attributes:** specifies the secure/non-secure attributes.

Return values

- **None:**

Notes

- Available attributes are to secure SBS items, so this function is only available in secure. SBS_FPU item attribute is only configurable through PRIVILEGE transaction.

HAL_SBS_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_SBS_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get the attribute of a SBS items.

Parameters

- **Item:** Single item to get secure/non-secure attribute from.
- **pAttributes:** pointer to return the attribute.

Return values

- **HAL:** status

Notes

- Available attributes have read restrictions, so this function is only available in secure

6.2 HAL Firmware driver defines

HAL FDCAN Error Code

HAL_FDCAN_ERROR_NONE
: No error

HAL_FDCAN_ERROR_TIMEOUT
: Timeout error

HAL_FDCAN_ERROR_NOT_INITIALIZED
: Peripheral not initialized

HAL_FDCAN_ERROR_NOT_READY
: Peripheral not ready

HAL_FDCAN_ERROR_NOT_STARTED
: Peripheral not started

HAL_FDCAN_ERROR_NOT_SUPPORTED
: Mode not supported

HAL_FDCAN_ERROR_PARAM
: Parameter error

HAL_FDCAN_ERROR_PENDING
: Pending operation

HAL_FDCAN_ERROR_RAM_ACCESS
: Message RAM Access Failure

HAL_FDCAN_ERROR_FIFO_EMPTY
: Put element in full FIFO

HAL_FDCAN_ERROR_FIFO_FULL
: Get element from empty FIFO

HAL_FDCAN_ERROR_LOG_OVERFLOW

Overflow of CAN Error Logging Counter

HAL_FDCAN_ERROR_RAM_WDG

Message RAM Watchdog event occurred

HAL_FDCAN_ERROR_PROTOCOL_ARBT

Protocol Error in Arbitration Phase (Nominal Bit Time is used)

HAL_FDCAN_ERROR_PROTOCOL_DATA

Protocol Error in Data Phase (Data Bit Time is used)

HAL_FDCAN_ERROR_RESERVED_AREA

Access to Reserved Address

HAL_FDCAN_ERROR_INVALID_CALLBACK

Invalid Callback error

I3C Notification ID definition

EVENT_ID_GETACCCR

I3C target complete controller-role hand-off (direct GETACCR CCC) event

EVENT_ID_IBIEND

I3C target IBI end process event

EVENT_ID_DAU

I3C target receive a dynamic address update (ENTDAA/RSTDAA/SETNEWDA CCC) event

EVENT_ID_GETx

I3C target receive any direct GETxxx CCC event

EVENT_ID_GETSTATUS

I3C target receive get status command (direct GETSTATUS CCC) event

EVENT_ID_SETMWL

I3C target receive maximum write length update (direct SETMWL CCC) event

EVENT_ID_SETMRL

I3C target receive maximum read length update(direct SETMRL CCC) event

EVENT_ID_RSTACT

I3C target detect reset pattern (broadcast or direct RSTACT CCC) event

EVENT_ID_ENTASx

I3C target receive activity state update (direct or broadcast ENTASx) event

EVENT_ID_ENEC_DISEC

I3C target receive a direct or broadcast ENEC/DISEC CCC event

EVENT_ID_DEFTGTS

I3C target receive a broadcast DEFTGTS CCC event

EVENT_ID_DEFGRPA

I3C target receive a group addressing (broadcast DEFGRPA CCC) event

EVENT_ID_WKP

I3C target wakeup event

EVENT_ID_IBI

I3C controller receive IBI event

EVENT_ID_CR

I3C controller controller-role request event

EVENT_ID_HJ

I3C controller hot-join event

HAL state definition

HAL_SMBUS_STATE_RESET

SMBUS not yet initialized or disabled

HAL_SMBUS_STATE_READY

SMBUS initialized and ready for use

HAL_SMBUS_STATE_BUSY

SMBUS internal process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_TX

Master Data Transmission process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_RX

Master Data Reception process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_TX

Slave Data Transmission process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_RX

Slave Data Reception process is ongoing

HAL_SMBUS_STATE_TIMEOUT

Timeout state

HAL_SMBUS_STATE_ERROR

Reception process is ongoing

HAL_SMBUS_STATE_LISTEN

Address Listen Mode is ongoing

7 HAL ADC Generic Driver

7.1 ADC Firmware driver registers structures

7.1.1 ADC_OversamplingTypeDef

ADC_OversamplingTypeDef is defined in the stm32h5xx_hal_adc.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***
- ***uint32_t TriggeredMode***
- ***uint32_t OversamplingStopReset***

Field Documentation

- ***uint32_t ADC_OversamplingTypeDef::Ratio***
  Configures the oversampling ratio. This parameter can be a value of ***ADC_HAL_EC_OVS_RATIO***
- ***uint32_t ADC_OversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***
- ***uint32_t ADC_OversamplingTypeDef::TriggeredMode***
  Selects the regular triggered oversampling mode. This parameter can be a value of ***ADC_HAL_EC_OVS_DISCONT_MODE***
- ***uint32_t ADC_OversamplingTypeDef::OversamplingStopReset***
  Selects the regular oversampling mode. The oversampling is either temporary stopped or reset upon an injected sequence interruption. If oversampling is enabled on both regular and injected groups, this parameter is discarded and forced to setting "ADC_REGOVERSAMPLING_RESUMED_MODE" (the oversampling buffer is zeroed during injection sequence). This parameter can be a value of ***ADC_HAL_EC_OVS_SCOPE_REG***

7.1.2 ADC_InitTypeDef

ADC_InitTypeDef is defined in the stm32h5xx_hal_adc.h

Data Fields

- ***uint32_t ClockPrescaler***
- ***uint32_t Resolution***
- ***uint32_t DataAlign***
- ***uint32_t ScanConvMode***
- ***uint32_t EOCSelection***
- ***FunctionalState LowPowerAutoWait***
- ***FunctionalState ContinuousConvMode***
- ***uint32_t NbrOfConversion***
- ***FunctionalState DiscontinuousConvMode***
- ***uint32_t NbrOfDiscConversion***
- ***uint32_t ExternalTrigConv***
- ***uint32_t ExternalTrigConvEdge***
- ***uint32_t SamplingMode***
- ***FunctionalState DMAContinuousRequests***
- ***uint32_t Overrun***
- ***FunctionalState OversamplingMode***
- ***ADC_OversamplingTypeDef Oversampling***

Field Documentation

- ***uint32_t ADC_InitTypeDef::ClockPrescaler***
  Select ADC clock source (synchronous clock derived from APB clock or asynchronous clock derived from system clock or PLL (Refer to reference manual for list of clocks available)) and clock prescaler. This parameter can be a value of ***ADC_HAL_EC_COMMON_CLOCK_SOURCE***. Note: The ADC clock configuration is common to all ADC instances. Note: In case of usage of channels on injected group, ADC frequency should be lower than AHB clock frequency /4 for resolution 12 or 10 bits, AHB clock frequency /3 for resolution 8 bits, AHB clock frequency /2 for resolution 6 bits. Note: In case of synchronous clock mode based on HCLK/1, the configuration must be enabled only if the system clock has a 50% duty clock cycle (APB prescaler configured inside RCC must be bypassed and PCLK clock must have 50% duty cycle). Refer to reference manual for details. Note: In case of usage of asynchronous clock, the selected clock must be preliminarily enabled at RCC top level. Note: This parameter can be modified only if all ADC instances are disabled.
- ***uint32_t ADC_InitTypeDef::Resolution***
  Configure the ADC resolution. This parameter can be a value of ***ADC_HAL_EC_RESOLUTION***
- ***uint32_t ADC_InitTypeDef::DataAlign***
  Specify ADC data alignment in conversion data register (right or left). Refer to reference manual for alignments formats versus resolutions. This parameter can be a value of ***ADC_HAL_EC_DATA_ALIGN***
- ***uint32_t ADC_InitTypeDef::ScanConvMode***
  Configure the sequencer of ADC groups regular and injected. This parameter can be associated to parameter 'DiscontinuousConvMode' to have main sequence subdivided in successive parts. If disabled: Conversion is performed in single mode (one channel converted, the one defined in rank 1). Parameters 'NbrOfConversion' and 'InjectedNbrOfConversion' are discarded (equivalent to set to 1). If enabled: Conversions are performed in sequence mode (multiple ranks defined by 'NbrOfConversion' or 'InjectedNbrOfConversion' and rank of each channel in sequencer). Scan direction is upward: from rank 1 to rank 'n'. This parameter can be a value of ***ADC_Scan_mode***
- ***uint32_t ADC_InitTypeDef::EOCSelection***
  Specify which EOC (End Of Conversion) flag is used for conversion by polling and interruption: end of unitary conversion or end of sequence conversions. This parameter can be a value of ***ADC_EOCSelection***.
- ***FunctionalState ADC_InitTypeDef::LowPowerAutoWait***
  Select the dynamic low power Auto Delay: new conversion start only when the previous conversion (for ADC group regular) or previous sequence (for ADC group injected) has been retrieved by user software, using function **HAL_ADC_GetValue()** or **HAL_ADCEx_InjectedGetValue()**. This feature automatically adapts the frequency of ADC conversions triggers to the speed of the system that reads the data. Moreover, this avoids risk of overrun for low frequency applications. This parameter can be set to ENABLE or DISABLE. Note: It is not recommended to use with interruption or DMA (**HAL_ADC_Start_IT()**, **HAL_ADC_Start_DMA()**) since these modes have to clear immediately the EOC flag (by CPU to free the IRQ pending event or by DMA). Auto wait will work but fort a very short time, discarding its intended benefit (except specific case of high load of CPU or DMA transfers which can justify usage of auto wait). Do use with polling: 1. Start conversion with **HAL_ADC_Start()**, 2. Later on, when ADC conversion data is needed: use **HAL_ADC_PollForConversion()** to ensure that conversion is completed and **HAL_ADC_GetValue()** to retrieve conversion result and trig another conversion start. (in case of usage of ADC group injected, use the equivalent functions HAL_ADCExInjected_Start(), **HAL_ADCEx_InjectedGetValue()**, ...).
- ***FunctionalState ADC_InitTypeDef::ContinuousConvMode***
  Specify whether the conversion is performed in single mode (one conversion) or continuous mode for ADC group regular, after the first ADC conversion start trigger occurred (software start or external trigger). This parameter can be set to ENABLE or DISABLE.
- ***uint32_t ADC_InitTypeDef::NbrOfConversion***
  Specify the number of ranks that will be converted within the regular group sequencer. This parameter is dependent on ScanConvMode:
  - sequencer configured to fully configurable: Number of ranks in the scan sequence is configurable using this parameter. Note: After the first call of '**HAL_ADC_Init()**', each rank corresponding to parameter "NbrOfConversion" must be set using '**HAL_ADC_ConfigChannel()**'. Afterwards, when all needed sequencer ranks are set, parameter 'NbrOfConversion' can be updated without modifying configuration of sequencer ranks (sequencer ranks above 'NbrOfConversion' are discarded).
  - sequencer configured to not fully configurable: Number of ranks in the scan sequence is defined by number of channels set in the sequence. This parameter is discarded. This parameter must be a number between Min_Data = 1 and Max_Data = 8. Note: This parameter must be modified when no conversion is on going on regular group (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

- ***FunctionalState ADC_InitTypeDef::DiscontinuousConvMode***
  Specify whether the conversions sequence of ADC group regular is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. If continuous mode is enabled, this parameter setting is discarded. This parameter can be set to ENABLE or DISABLE. Note: On this STM32 series, ADC group regular number of discontinuous ranks increment is fixed to one-by-one.
- ***uint32_t ADC_InitTypeDef::NbrOfDiscConversion***
  Specifies the number of discontinuous conversions in which the main sequence of ADC group regular (parameter NbrOfConversion) will be subdivided. If parameter 'DiscontinuousConvMode' is disabled, this parameter is discarded. This parameter must be a number between Min_Data = 1 and Max_Data = 8.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConv***
  Select the external event source used to trigger ADC group regular conversion start. If set to ADC_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_regular_external_trigger_source***. Caution: external trigger source is common to all ADC instances.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConvEdge***
  Select the external event edge used to trigger ADC group regular conversion start If trigger source is set to ADC_SOFTWARE_START, this parameter is discarded. This parameter can be a value of ***ADC_regular_external_trigger_edge***
- ***uint32_t ADC_InitTypeDef::SamplingMode***
  Select the sampling mode to be used for ADC group regular conversion. This parameter can be a value of ***ADC_regular_sampling_mode***
- ***FunctionalState ADC_InitTypeDef::DMAContinuousRequests***
  Specify whether the DMA requests are performed in one shot mode (DMA transfer stops when number of conversions is reached) or in continuous mode (DMA transfer unlimited, whatever number of conversions). This parameter can be set to ENABLE or DISABLE. Note: In continuous mode, DMA must be configured in circular mode. Otherwise an overrun will be triggered when DMA buffer maximum pointer is reached.
- ***uint32_t ADC_InitTypeDef::Overrun***
  Select the behavior in case of overrun: data overwritten or preserved (default). This parameter applies to ADC group regular only. This parameter can be a value of ***ADC_HAL_EC_REG_OVR_DATA_BEHAVIOR***. Note: In case of overrun set to data preserved and usage with programming model with interruption (HAL_Start_IT()): ADC IRQ handler has to clear end of conversion flags, this induces the release of the preserved data. If needed, this data can be saved in function **HAL_ADC_ConvCpltCallback()**, placed in user program code (called before end of conversion flags clear) Note: Error reporting with respect to the conversion mode:
  - Usage with ADC conversion by polling for event or interruption: Error is reported only if overrun is set to data preserved. If overrun is set to data overwritten, user can willingly not read all the converted data, this is not considered as an erroneous case.
  - Usage with ADC conversion by DMA: Error is reported whatever overrun setting (DMA is expected to process all data from data register).
- ***FunctionalState ADC_InitTypeDef::OversamplingMode***
  Specify whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing on ADC groups regular and injected
- ***ADC_OversamplingTypeDef ADC_InitTypeDef::Oversampling***
  Specify the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling is already enabled.

7.1.3 ADC_ChannelConfTypeDef

ADC_ChannelConfTypeDef is defined in the stm32h5xx_hal_adc.h

Data Fields

- ***uint32_t Channel***
- ***uint32_t Rank***
- ***uint32_t SamplingTime***
- ***uint32_t SingleDiff***
- ***uint32_t OffsetNumber***

- ***uint32_t Offset***
- ***uint32_t OffsetSign***
- ***FunctionalState OffsetSaturation***

Field Documentation

- ***uint32_t ADC_ChannelConfTypeDef::Channel***
  Specify the channel to configure into ADC regular group. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.
- ***uint32_t ADC_ChannelConfTypeDef::Rank***
  Specify the rank in the regular group sequencer. This parameter can be a value of ***ADC_HAL_EC_REG_SEQ_RANKS*** Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)
- ***uint32_t ADC_ChannelConfTypeDef::SamplingTime***
  Sampling time value to be set for the selected channel. Unit: ADC clock cycles Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME*** Caution: This parameter applies to a channel that can be used into regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt, Vbat, ...), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting). Refer to device datasheet for timings values.
- ***uint32_t ADC_ChannelConfTypeDef::SingleDiff***
  Select single-ended or differential input. In differential mode: Differential measurement is carried out between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically This parameter must be a value of ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING*** Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)
- ***uint32_t ADC_ChannelConfTypeDef::OffsetNumber***
  Select the offset number This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB*** Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.
- ***uint32_t ADC_ChannelConfTypeDef::Offset***
  Define the offset to be applied on the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_ChannelConfTypeDef::OffsetSign***
  Define if the offset should be subtracted (negative sign) or added (positive sign) from or to the raw converted data. This parameter can be a value of ***ADCEx_OffsetSign***. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_ChannelConfTypeDef::OffsetSaturation***
  Define if the offset should be saturated upon under or over flow. This parameter value can be ENABLE or DISABLE. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

7.1.4 ADC_AnalogWDGConfTypeDef

ADC_AnalogWDGConfTypeDef is defined in the stm32h5xx_hal_adc.h

Data Fields

- ***uint32_t WatchdogNumber***
- ***uint32_t WatchdogMode***

- ***uint32_t Channel***
- ***FunctionalState ITMode***
- ***uint32_t HighThreshold***
- ***uint32_t LowThreshold***
- ***uint32_t FilteringConfig***

Field Documentation

- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogNumber***
  Select which ADC analog watchdog is monitoring the selected channel. For Analog Watchdog 1: Only 1 channel can be monitored (or overall group of channels by setting parameter 'WatchdogMode') For Analog Watchdog 2 and 3: Several channels can be monitored (by successive calls of '**HAL_ADC_AnalogWDGConfig()**' for each channel) This parameter can be a value of ***ADC_HAL_EC_AWD_NUMBER***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogMode***
  Configure the ADC analog watchdog mode: single/all/none channels. For Analog Watchdog 1: Configure the ADC analog watchdog mode: single channel or all channels, ADC groups regular and-or injected. For Analog Watchdog 2 and 3: Several channels can be monitored by applying successively the AWD init structure. Channels on ADC group regular and injected are not differentiated: Set value 'ADC_ANALOGWATCHDOG_SINGLE_xxx' to monitor 1 channel, value 'ADC_ANALOGWATCHDOG_ALL_xxx' to monitor all channels, 'ADC_ANALOGWATCHDOG_NONE' to monitor no channel. This parameter can be a value of ***ADC_analog_watchdog_mode***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::Channel***
  Select which ADC channel to monitor by analog watchdog. For Analog Watchdog 1: this parameter has an effect only if parameter 'WatchdogMode' is configured on single channel (only 1 channel can be monitored). For Analog Watchdog 2 and 3: Several channels can be monitored. To use this feature, call successively the function **HAL_ADC_AnalogWDGConfig()** for each channel to be added (or removed with value 'ADC_ANALOGWATCHDOG_NONE'). This parameter can be a value of ***ADC_HAL_EC_CHANNEL***.
- ***FunctionalState ADC_AnalogWDGConfTypeDef::ITMode***
  Specify whether the analog watchdog is configured in interrupt or polling mode. This parameter can be set to ENABLE or DISABLE
- ***uint32_t ADC_AnalogWDGConfTypeDef::HighThreshold***
  Configure the ADC analog watchdog High threshold value. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored. Note: If ADC oversampling is enabled, ADC analog watchdog thresholds are impacted: the comparison of analog watchdog thresholds is done on oversampling final computation (after ratio and shift application): ADC data register bitfield [15:4] (12 most significant bits).
- ***uint32_t ADC_AnalogWDGConfTypeDef::LowThreshold***
  Configures the ADC analog watchdog Low threshold value. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits: if ADC resolution is 12 bits the 4 LSB are ignored, if ADC resolution is 10 bits the 2 LSB are ignored. Note: If ADC oversampling is enabled, ADC analog watchdog thresholds are impacted: the comparison of analog watchdog thresholds is done on oversampling final computation (after ratio and shift application): ADC data register bitfield [15:4] (12 most significant bits).
- ***uint32_t ADC_AnalogWDGConfTypeDef::FilteringConfig***
  Specify whether filtering should be use and the number of samples to consider. Before setting flag or raising interrupt, analog watchdog can wait to have several consecutive out-of-window samples. This parameter allows to configure this number. This parameter only applies to Analog watchdog 1. For others, use value ADC_AWD_FILTERING_NONE. This parameter can be a value of ***ADC_analog_watchdog_filtering_config***.

7.1.5 ADC_InjectionConfigTypeDef

ADC_InjectionConfigTypeDef is defined in the stm32h5xx_hal_adc.h

Data Fields

- ***uint32_t ContextQueue***
- ***uint32_t ChannelCount***

Field Documentation

- ***uint32_t ADC_InjectionConfigTypeDef::ContextQueue***
  Injected channel configuration context: build-up over each **HAL_ADCEx_InjectedConfigChannel()** call to finally initialize JSQR register at **HAL_ADCEx_InjectedConfigChannel()** last call
- ***uint32_t ADC_InjectionConfigTypeDef::ChannelCount***
  Number of channels in the injected sequence

7.1.6 __ADC_HandleTypeDef

__ADC_HandleTypeDef is defined in the stm32h5xx_hal_adc.h

Data Fields

- ***ADC_TypeDef * Instance***
- ***ADC_InitTypeDef Init***
- ***DMA_HandleTypeDef * DMA_Handle***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***ADC_InjectionConfigTypeDef InjectionConfig***
- ***void(* ConvCpltCallback***
- ***void(* ConvHalfCpltCallback***
- ***void(* LevelOutOfWindowCallback***
- ***void(* ErrorCallback***
- ***void(* InjectedConvCpltCallback***
- ***void(* InjectedQueueOverflowCallback***
- ***void(* LevelOutOfWindow2Callback***
- ***void(* LevelOutOfWindow3Callback***
- ***void(* EndOfSamplingCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***ADC_TypeDef* __ADC_HandleTypeDef::Instance***
  Register base address
- ***ADC_InitTypeDef __ADC_HandleTypeDef::Init***
  ADC initialization parameters and regular conversions setting
- ***DMA_HandleTypeDef* __ADC_HandleTypeDef::DMA_Handle***
  Pointer DMA Handler
- ***HAL_LockTypeDef __ADC_HandleTypeDef::Lock***
  ADC locking object
- ***__IO uint32_t __ADC_HandleTypeDef::State***
  ADC communication state (bitmap of ADC states)
- ***__IO uint32_t __ADC_HandleTypeDef::ErrorCode***
  ADC Error code
- ***ADC_InjectionConfigTypeDef __ADC_HandleTypeDef::InjectionConfig***
  ADC injected channel configuration build-up structure
- ***void(* __ADC_HandleTypeDef::ConvCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC conversion complete callback
- ***void(* __ADC_HandleTypeDef::ConvHalfCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC conversion DMA half-transfer callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindowCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 1 callback
- ***void(* __ADC_HandleTypeDef::ErrorCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC error callback
- ***void(* __ADC_HandleTypeDef::InjectedConvCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC group injected conversion complete callback

- ***void(* __ADC_HandleTypeDef::InjectedQueueOverflowCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC group injected context queue overflow callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindow2Callback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 2 callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindow3Callback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 3 callback
- ***void(* __ADC_HandleTypeDef::EndOfSamplingCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC end of sampling callback
- ***void(* __ADC_HandleTypeDef::MspInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp Init callback
- ***void(* __ADC_HandleTypeDef::MspDeInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp DeInit callback

7.2 ADC Firmware driver API description

The following section lists the various functions of the ADC library.

7.2.1 ADC peripheral features

- 12-bit, 10-bit, 8-bit or 6-bit configurable resolution.
- Interrupt generation at the end of regular conversion and in case of analog watchdog or overrun events.
- Single and continuous conversion modes.
- Scan mode for conversion of several channels sequentially.
- Data alignment with in-built data coherency.
- Programmable sampling time (channel wise)
- External trigger (timer or EXTI) with configurable polarity
- DMA request generation for transfer of conversions data of regular group.
- Configurable delay between conversions in Dual interleaved mode.
- ADC channels selectable single/differential input.
- ADC offset shared on 4 offset instances.
- ADC calibration
- ADC conversion of regular group.
- ADC supply requirements: 1.62 V to 3.6 V.
- ADC input range: from Vref- (connected to Vssa) to Vref+ (connected to Vdda or to an external voltage reference).

7.2.2 How to use this driver

Configuration of top level parameters related to ADC

1. Enable the ADC interface
   - As prerequisite, ADC clock must be configured at RCC top level.
   - Two clock settings are mandatory:
     - ADC clock (core clock, also possibly conversion clock).
     - ADC clock (conversions clock). Two possible clock sources: synchronous clock derived from AHB clock or asynchronous clock derived from system clock or PLL.
     - Example: Into HAL_ADC_MspInit() (recommended code location) or with other device clock parameters configuration:
     - __HAL_RCC_ADC_CLK_ENABLE(); (mandatory) RCC_ADCCLKSOURCE_PLL enable: (optional: if asynchronous clock selected)
     - RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     - PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC;
     - PeriphClkInit.AdcClockSelection = RCC_ADCCLKSOURCE_PLL;
     - HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
   - ADC clock source and clock prescaler are configured at ADC level with parameter "ClockPrescaler" using function HAL_ADC_Init().
2. ADC pins configuration
   - Enable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_ENABLE()
   - Configure these ADC pins in analog mode using function HAL_GPIO_Init()
3. Optionally, in case of usage of ADC with interruptions:
   - Configure the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding ADC interruption vector ADCx_IRQHandler().
4. Optionally, in case of usage of DMA:
   - Configure the DMA (DMA channel, mode normal or circular, ...) using function HAL_DMA_Init().
   - Configure the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding DMA interruption vector DMAx_Channelx_IRQHandler().

Configuration of ADC, group regular, channels parameters

1. Configure the ADC parameters (resolution, data alignment, ...) and regular group parameters (conversion trigger, sequencer, ...) using function HAL_ADC_Init().
2. Configure the channels for regular group parameters (channel number, channel rank into sequencer, ..., into regular group) using function HAL_ADC_ConfigChannel().
3. Optionally, configure the analog watchdog parameters (channels monitored, thresholds, ...) using function HAL_ADC_AnalogWDGConfig().

Execution of ADC conversions

1. Optionally, perform an automatic ADC calibration to improve the conversion accuracy using function HAL_ADCEx_Calibration_Start().

2. ADC driver can be used among three modes: polling, interruption, transfer by DMA.
   - ADC conversion by polling:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start()
     - Wait for ADC conversion completion using function HAL_ADC_PollForConversion()
     - Retrieve conversion results using function HAL_ADC_GetValue()
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop()
   - ADC conversion by interruption:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start_IT()
     - Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() (this function must be implemented in user program)
     - Retrieve conversion results using function HAL_ADC_GetValue()
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_IT()
   - ADC conversion with transfer by DMA:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start_DMA()
     - Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() or HAL_ADC_ConvHalfCpltCallback() (these functions must be implemented in user program)
     - Conversion results are automatically transferred by DMA into destination variable address.
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_DMA()

Note: Callback functions must be implemented in user program:

- *HAL_ADC_ErrorCallback()*
- *HAL_ADC_LevelOutOfWindowCallback() (callback of analog watchdog)*
- *HAL_ADC_ConvCpltCallback()*
- *HAL_ADC_ConvHalfCpltCallback*

Deinitialization of ADC

1. Disable the ADC interface
   - ADC clock can be hard reset and disabled at RCC top level.
   - Hard reset of ADC peripherals using macro __ADCx_FORCE_RESET(), __ADCx_RELEASE_RESET().
   - ADC clock disable using the equivalent macro/functions as configuration step.
     - Example: Into HAL_ADC_MspDeInit() (recommended code location) or with other device clock parameters configuration:
     - RCC_OscInitStructure.OscillatorType = RCC_OSCILLATORTYPE_HSI14;
     - RCC_OscInitStructure.HSI14State = RCC_HSI14_OFF; (if not used for system clock)
     - HAL_RCC_OscConfig(&RCC_OscInitStructure);
2. ADC pins configuration
   - Disable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_DISABLE()
3. Optionally, in case of usage of ADC with interruptions:
   - Disable the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
4. Optionally, in case of usage of DMA:
   - Deinitialize the DMA using function HAL_DMA_Init().
   - Disable the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)

Callback registration

The compilation flag USE_HAL_ADC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_ADC_RegisterCallback() to register an interrupt callback.

Function @ref HAL_ADC_RegisterCallback() allows to register following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback

- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- InjectedQueueOverflowCallback : ADC group injected context queue overflow callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_ADC_UnRegisterCallback to reset a callback to the default weak function.

@ref HAL_ADC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- InjectedQueueOverflowCallback : ADC group injected context queue overflow callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback

By default, after the @ref HAL_ADC_Init() and when the state is @ref HAL_ADC_STATE_RESET all callbacks are set to the corresponding weak functions: examples @ref HAL_ADC_ConvCpltCallback(), @ref HAL_ADC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the @ref HAL_ADC_Init()/ @ref HAL_ADC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the @ref HAL_ADC_Init()/ @ref HAL_ADC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in @ref HAL_ADC_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in @ref HAL_ADC_STATE_READY or @ref HAL_ADC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using @ref HAL_ADC_RegisterCallback() before calling @ref HAL_ADC_DeInit() or @ref HAL_ADC_Init() function.

When the compilation flag USE_HAL_ADC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

7.2.3 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on regular group
- Configure the analog watchdog

This section contains the following APIs:

- ***HAL_ADC_ConfigChannel()***
- ***HAL_ADC_AnalogWDGConfig()***

7.2.4 Peripheral state and errors functions

This subsection provides functions to get in run-time the status of the peripheral.

- Check the ADC state
- Check the ADC error code

This section contains the following APIs:

- *HAL_ADC_GetState()*
- *HAL_ADC_GetError()*

7.2.5 Detailed description of functions

HAL_ADC_Init

Function name

HAL_StatusTypeDef HAL_ADC_Init (ADC_HandleTypeDef * hadc)

Function description

Initialize the ADC peripheral and regular group according to parameters specified in structure "ADC_InitTypeDef".

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- As prerequisite, ADC clock must be configured at RCC top level (refer to description of RCC configuration for ADC in header of this file).
- Possibility to update parameters on the fly: This function initializes the ADC MSP (HAL_ADC_MspInit()) only when coming from ADC state reset. Following calls to this function can be used to reconfigure some parameters of ADC_InitTypeDef structure on the fly, without modifying MSP configuration. If ADC MSP has to be modified again, HAL_ADC_DeInit() must be called before HAL_ADC_Init(). The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_InitTypeDef".
- This function configures the ADC within 2 scopes: scope of entire ADC and scope of regular group. For parameters details, see comments of structure "ADC_InitTypeDef".
- Parameters related to common ADC registers (ADC clock mode) are set only if all ADCs are disabled. If this is not the case, these common parameters setting are bypassed without error reporting: it can be the intended behaviour in case of update of a parameter of ADC_InitTypeDef on the fly, without disabling the other ADCs.

HAL_ADC_DeInit

Function name

HAL_StatusTypeDef HAL_ADC_DeInit (ADC_HandleTypeDef * hadc)

Function description

Deinitialize the ADC peripheral registers to their default reset values, with deinitialization of the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- For devices with several ADCs: reset of ADC common registers is done only if all ADCs sharing the same common group are disabled. (function "HAL_ADC_MspDeInit()" is also called under the same conditions: all ADC instances use the same core clock at RCC level, disabling the core clock reset all ADC instances). If this is not the case, reset of these common parameters reset is bypassed without error reporting: it can be the intended behavior in case of reset of a single ADC while the other ADCs sharing the same common group is still running.
- By default, HAL_ADC_DeInit() set ADC in mode deep power-down: this saves more power by reducing leakage currents and is particularly interesting before entering MCU low-power modes.

HAL_ADC_MspInit

Function name

void HAL_ADC_MspInit (ADC_HandleTypeDef * hadc)

Function description

Initialize the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_MspDeInit

Function name

void HAL_ADC_MspDeInit (ADC_HandleTypeDef * hadc)

Function description

DeInitialize the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- All ADC instances use the same core clock at RCC level, disabling the core clock reset all ADC instances).

HAL_ADC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_ADC_RegisterCallback (ADC_HandleTypeDef * hadc, HAL_ADC_CallbackIDTypeDef CallbackID, pADC_CallbackTypeDef pCallback)

Function description

Register a User ADC Callback To be used instead of the weak predefined callback.

Parameters

- **hadc:** Pointer to a ADC_HandleTypeDef structure that contains the configuration information for the specified ADC.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_ADC_CONVERSION_COMPLETE_CB_ID ADC conversion complete callback ID
  - HAL_ADC_CONVERSION_HALF_CB_ID ADC conversion DMA half-transfer callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_1_CB_ID ADC analog watchdog 1 callback ID
  - HAL_ADC_ERROR_CB_ID ADC error callback ID
  - HAL_ADC_INJ_CONVERSION_COMPLETE_CB_ID ADC group injected conversion complete callback ID
  - HAL_ADC_INJ_QUEUE_OVEFLOW_CB_ID ADC group injected context queue overflow callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_2_CB_ID ADC analog watchdog 2 callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_3_CB_ID ADC analog watchdog 3 callback ID
  - HAL_ADC_END_OF_SAMPLING_CB_ID ADC end of sampling callback ID
  - HAL_ADC_MSPINIT_CB_ID ADC Msp Init callback ID
  - HAL_ADC_MSPDEINIT_CB_ID ADC Msp DeInit callback ID
  - HAL_ADC_MSPINIT_CB_ID MspInit callback ID
  - HAL_ADC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_ADC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_ADC_UnRegisterCallback (ADC_HandleTypeDef * hadc, HAL_ADC_CallbackIDTypeDef CallbackID)

Function description

Unregister a ADC Callback ADC callback is redirected to the weak predefined callback.

Parameters

- **hadc:** Pointer to a ADC_HandleTypeDef structure that contains the configuration information for the specified ADC.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_ADC_CONVERSION_COMPLETE_CB_ID ADC conversion complete callback ID
  - HAL_ADC_CONVERSION_HALF_CB_ID ADC conversion DMA half-transfer callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_1_CB_ID ADC analog watchdog 1 callback ID
  - HAL_ADC_ERROR_CB_ID ADC error callback ID
  - HAL_ADC_INJ_CONVERSION_COMPLETE_CB_ID ADC group injected conversion complete callback ID
  - HAL_ADC_INJ_QUEUE_OVEFLOW_CB_ID ADC group injected context queue overflow callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_2_CB_ID ADC analog watchdog 2 callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_3_CB_ID ADC analog watchdog 3 callback ID
  - HAL_ADC_END_OF_SAMPLING_CB_ID ADC end of sampling callback ID
  - HAL_ADC_MSPINIT_CB_ID ADC Msp Init callback ID
  - HAL_ADC_MSPDEINIT_CB_ID ADC Msp DeInit callback ID
  - HAL_ADC_MSPINIT_CB_ID MspInit callback ID
  - HAL_ADC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_ADC_Start

Function name

HAL_StatusTypeDef HAL_ADC_Start (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of regular group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function: None.
- Case of multimode enabled (when multimode feature is available): if ADC is Slave, ADC is enabled but conversion is not started, if ADC is master, ADC is enabled and multimode conversion is started.

HAL_ADC_Stop

Function name

HAL_StatusTypeDef HAL_ADC_Stop (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected channels in case of auto_injection mode), disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : ADC peripheral disable is forcing stop of potential conversion on injected group. If injected group is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.

HAL_ADC_PollForConversion

Function name

HAL_StatusTypeDef HAL_ADC_PollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

Wait for regular group conversion to be completed.

Parameters

- **hadc:** ADC handle
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- ADC conversion flags EOS (end of sequence) and EOC (end of conversion) are cleared by this function, with an exception: if low power feature "LowPowerAutoWait" is enabled, flags are not cleared to not interfere with this feature until data register is read using function HAL_ADC_GetValue().
- This function cannot be used in a particular setup: ADC configured in DMA mode and polling for end of each conversion (ADC init parameter "EOCSelection" set to ADC_EOC_SINGLE_CONV). In this case, DMA resets the flag EOC and polling cannot be performed on each conversion. Nevertheless, polling can still be performed on the complete sequence (ADC init parameter "EOCSelection" set to ADC_EOC_SEQ_CONV).

HAL_ADC_PollForEvent

Function name

HAL_StatusTypeDef HAL_ADC_PollForEvent (ADC_HandleTypeDef * hadc, uint32_t EventType, uint32_t Timeout)

Function description

Poll for ADC event.

Parameters

- **hadc:** ADC handle
- **EventType:** the ADC event type. This parameter can be one of the following values:
  - ADC_EOSMP_EVENT ADC End of Sampling event
  - ADC_AWD1_EVENT ADC Analog watchdog 1 event (main analog watchdog, present on all STM32 series)
  - ADC_AWD2_EVENT ADC Analog watchdog 2 event (additional analog watchdog, not present on all STM32 series)
  - ADC_AWD3_EVENT ADC Analog watchdog 3 event (additional analog watchdog, not present on all STM32 series)
  - ADC_OVR_EVENT ADC Overrun event
  - ADC_JQOVF_EVENT ADC Injected context queue overflow event
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- The relevant flag is cleared if found to be set, except for ADC_FLAG_OVR. Indeed, the latter is reset only if hadc->Init.Overrun field is set to ADC_OVR_DATA_OVERWRITTEN. Otherwise, data register may be potentially overwritten by a new converted data as soon as OVR is cleared. To reset OVR flag once the preserved data is retrieved, the user can resort to macro __HAL_ADC_CLEAR_FLAG(hadc, ADC_FLAG_OVR);

HAL_ADC_Start_IT

Function name

HAL_StatusTypeDef HAL_ADC_Start_IT (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of regular group with interruption.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function according to initialization setting : EOC (end of conversion), EOS (end of sequence), OVR overrun. Each of these interruptions has its dedicated callback function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Start_IT() must be called for ADC Slave first, then for ADC Master. For ADC Slave, ADC is enabled only (conversion is not started). For ADC Master, ADC is enabled and multimode conversion is started.
- To guarantee a proper reset of all interruptions once all the needed conversions are obtained, HAL_ADC_Stop_IT() must be called to ensure a correct stop of the IT-based conversions.
- By default, HAL_ADC_Start_IT() does not enable the End Of Sampling interruption. If required (e.g. in case of oversampling with trigger mode), the user must: 1. first clear the EOSMP flag if set with macro __HAL_ADC_CLEAR_FLAG(hadc, ADC_FLAG_EOSMP) 2. then enable the EOSMP interrupt with macro __HAL_ADC_ENABLE_IT(hadc, ADC_IT_EOSMP) before calling HAL_ADC_Start_IT().

HAL_ADC_Stop_IT

Function name

HAL_StatusTypeDef HAL_ADC_Stop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable interrution of end-of-conversion, disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADC_Start_DMA

Function name

HAL_StatusTypeDef HAL_ADC_Start_DMA (ADC_HandleTypeDef * hadc, uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start conversion of regular group and transfer result through DMA.

Parameters

- **hadc:** ADC handle
- **pData:** Destination Buffer address.
- **Length:** Number of data to be transferred from ADC peripheral to memory

Return values

- **HAL:** status.

Notes

- Interruptions enabled in this function: overrun (if applicable), DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Start_DMA() is designed for single-ADC mode only. For multimode, the dedicated HAL_ADCEx_MultiModeStart_DMA() function must be used.

HAL_ADC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_ADC_Stop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable ADC DMA transfer, disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : ADC peripheral disable is forcing stop of potential conversion on ADC group injected. If ADC group injected is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Stop_DMA() function is dedicated to single-ADC mode only. For multimode, the dedicated HAL_ADCEx_MultiModeStop_DMA() API must be used.

HAL_ADC_GetValue

Function name

uint32_t HAL_ADC_GetValue (const ADC_HandleTypeDef * hadc)

Function description

Get ADC regular group conversion result.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** group regular conversion data

Notes

- Reading register DR automatically clears ADC flag EOC (ADC group regular end of unitary conversion).
- This function does not clear ADC flag EOS (ADC group regular end of sequence conversion). Occurrence of flag EOS rising: If sequencer is composed of 1 rank, flag EOS is equivalent to flag EOC.If sequencer is composed of several ranks, during the scan sequence flag EOC only is raised, at the end of the scan sequence both flags EOC and EOS are raised. To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling: HAL_ADC_PollForConversion() or __HAL_ADC_CLEAR_FLAG(&hadc, ADC_FLAG_EOS).

HAL_ADC_StartSampling

Function name

HAL_StatusTypeDef HAL_ADC_StartSampling (ADC_HandleTypeDef * hadc)

Function description

Start ADC conversion sampling phase of regular group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : This function should only be called to start sampling when ADC_SAMPLING_MODE_TRIGGER_CONTROLED sampling mode has been selectedADC_SOFTWARE_START has been selected as trigger source

HAL_ADC_StopSampling

Function name

HAL_StatusTypeDef HAL_ADC_StopSampling (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion sampling phase of regular group and start conversion.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : This function should only be called to stop sampling when ADC_SAMPLING_MODE_TRIGGER_CONTROLED sampling mode has been selectedADC_SOFTWARE_START has been selected as trigger sourceafter sampling has been started using HAL_ADC_StartSampling.

HAL_ADC_IRQHandler

Function name

void HAL_ADC_IRQHandler (ADC_HandleTypeDef * hadc)

Function description

Handle ADC interrupt request.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConvCpltCallback

Function name

void HAL_ADC_ConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Conversion complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConvHalfCpltCallback

Function name

void HAL_ADC_ConvHalfCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Conversion DMA half-transfer callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_LevelOutOfWindowCallback

Function name

void HAL_ADC_LevelOutOfWindowCallback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 1 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ErrorCallback

Function name

void HAL_ADC_ErrorCallback (ADC_HandleTypeDef * hadc)

Function description

ADC error callback in non-blocking mode (ADC conversion with interruption or transfer by DMA).

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- In case of error due to overrun when using ADC with DMA transfer (HAL ADC handle parameter "ErrorCode" to state "HAL_ADC_ERROR_OVR"): Reinitialize the DMA using function "HAL_ADC_Stop_DMA()".If needed, restart a new ADC conversion using function "HAL_ADC_Start_DMA()" (this function is also clearing overrun flag)

HAL_ADC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_ADC_ConfigChannel (ADC_HandleTypeDef * hadc, const ADC_ChannelConfTypeDef * pConfig)

Function description

Configure a channel to be assigned to ADC group regular.

Parameters

- **hadc:** ADC handle
- **pConfig:** Structure of ADC channel assigned to ADC group regular.

Return values

- **HAL:** status

Notes

- In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL_ADC_DeInit().
- Possibility to update parameters on the fly: This function initializes channel into ADC group regular, following calls to this function can be used to reconfigure some parameters of structure "ADC_ChannelConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state: Refer to comments of structure "ADC_ChannelConfTypeDef".

HAL_ADC_AnalogWDGConfig

Function name

HAL_StatusTypeDef HAL_ADC_AnalogWDGConfig (ADC_HandleTypeDef * hadc, const ADC_AnalogWDGConfTypeDef * pAnalogWDGConfig)

Function description

Configure the analog watchdog.

Parameters

- **hadc:** ADC handle
- **pAnalogWDGConfig:** Structure of ADC analog watchdog configuration

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes the selected analog watchdog, successive calls to this function can be used to reconfigure some parameters of structure "ADC_AnalogWDGConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_AnalogWDGConfTypeDef".
- On this STM32 series, analog watchdog thresholds can be modified while ADC conversion is on going. In this case, some constraints must be taken into account: the programmed threshold values are effective from the next ADC EOC (end of unitary conversion). Considering that registers write delay may happen due to bus activity, this might cause an uncertainty on the effective timing of the new programmed threshold values.

HAL_ADC_GetState

Function name

uint32_t HAL_ADC_GetState (const ADC_HandleTypeDef * hadc)

Function description

Return the ADC handle state.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** handle state (bitfield on 32 bits)

Notes

- ADC state machine is managed by bitfields, ADC status must be compared with states bits. For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) "

HAL_ADC_GetError

Function name

uint32_t HAL_ADC_GetError (const ADC_HandleTypeDef * hadc)

Function description

Return the ADC error code.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** error code (bitfield on 32 bits)

ADC_ConversionStop

Function name

HAL_StatusTypeDef ADC_ConversionStop (ADC_HandleTypeDef * hadc, uint32_t ConversionGroup)

Function description

Stop ADC conversion.

Parameters

- **hadc:** ADC handle
- **ConversionGroup:** ADC group regular and/or injected. This parameter can be one of the following values:
  - ADC_REGULAR_GROUP ADC regular conversion type.
  - ADC_INJECTED_GROUP ADC injected conversion type.
  - ADC_REGULAR_INJECTED_GROUP ADC regular and injected conversion type.

Return values

- **HAL:** status.

ADC_Enable

Function name

HAL_StatusTypeDef ADC_Enable (ADC_HandleTypeDef * hadc)

Function description

Enable the selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- Prerequisite condition to use this function: ADC must be disabled and voltage regulator must be enabled (done into HAL_ADC_Init()).

ADC_Disable

Function name

HAL_StatusTypeDef ADC_Disable (ADC_HandleTypeDef * hadc)

Function description

Disable the selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- Prerequisite condition to use this function: ADC conversions must be stopped.

ADC_DMAConvCplt

Function name

void ADC_DMAConvCplt (DMA_HandleTypeDef * hdma)

Function description

DMA transfer complete callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_DMAHalfConvCplt

Function name

void ADC_DMAHalfConvCplt (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_DMAError

Function name

void ADC_DMAError (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

7.3 ADC Firmware driver defines

The following section lists the various define and macros of the module.

7.3.1 ADC

ADC

ADC analog watchdog (AWD) filtering configuration

ADC_AWD_FILTERING_NONE

ADC AWD no filtering, one out-of-window sample to raise flag or interrupt

ADC_AWD_FILTERING_2SAMPLES

ADC AWD 2 consecutives out-of-window samples to raise flag or interrupt

ADC_AWD_FILTERING_3SAMPLES

ADC AWD 3 consecutives out-of-window samples to raise flag or interrupt

ADC_AWD_FILTERING_4SAMPLES

ADC AWD 4 consecutives out-of-window samples to raise flag or interrupt

ADC_AWD_FILTERING_5SAMPLES

ADC AWD 5 consecutives out-of-window samples to raise flag or interrupt

ADC_AWD_FILTERING_6SAMPLES

ADC AWD 6 consecutives out-of-window samples to raise flag or interrupt

ADC_AWD_FILTERING_7SAMPLES

ADC AWD 7 consecutives out-of-window samples to raise flag or interrupt

ADC_AWD_FILTERING_8SAMPLES

ADC AWD 8 consecutives out-of-window samples to raise flag or interrupt

ADC analog watchdog (AWD) mode

ADC_ANALOGWATCHDOG_NONE

ADC AWD not selected

ADC_ANALOGWATCHDOG_SINGLE_REG

ADC AWD applied to a regular group single channel

ADC_ANALOGWATCHDOG_SINGLE_INJEC

ADC AWD applied to an injected group single channel

ADC_ANALOGWATCHDOG_SINGLE_REGINJEC

ADC AWD applied to a regular and injected groups single channel

ADC_ANALOGWATCHDOG_ALL_REG

ADC AWD applied to regular group all channels

ADC_ANALOGWATCHDOG_ALL_INJEC

ADC AWD applied to injected group all channels

ADC_ANALOGWATCHDOG_ALL_REGINJEC

ADC AWD applied to regular and injected groups all channels

ADCx CFGR fields

ADC_CFGR_FIELDS

ADCx CFGR sub fields

ADC_CFGR_FIELDS_2

ADC sequencer end of unitary conversion or sequence conversions

ADC_EOC_SINGLE_CONV

End of unitary conversion flag

ADC_EOC_SEQ_CONV

End of sequence conversions flag

ADC Error Code

HAL_ADC_ERROR_NONE

No error

HAL_ADC_ERROR_INTERNAL

ADC peripheral internal error (problem of clocking, enable/disable, erroneous state, ...)

HAL_ADC_ERROR_OVR

Overrun error

HAL_ADC_ERROR_DMA

DMA transfer error

HAL_ADC_ERROR_JQOVF

Injected context queue overflow error

HAL_ADC_ERROR_INVALID_CALLBACK

Invalid Callback error

ADC Event type

ADC_EOSMP_EVENT

Notes:

- Analog watchdog 1 is available on all stm32 series Analog watchdog 2 and 3 are not available on all series ADC End of Sampling event

ADC_AWD1_EVENT

ADC Analog watchdog 1 event (main analog watchdog)

ADC_AWD2_EVENT

ADC Analog watchdog 2 event (additional analog watchdog)

ADC_AWD3_EVENT

ADC Analog watchdog 3 event (additional analog watchdog)

ADC_OVR_EVENT

ADC overrun event

ADC_JQOVF_EVENT

ADC Injected Context Queue Overflow event

ADC Exported Constants

ADC_AWD_EVENT

ADC Analog watchdog 1 event: Naming for compatibility with other STM32 devices having only one analog watchdog

ADC flags definition

ADC_FLAG_RDY

ADC Ready flag

ADC_FLAG_EOSMP

ADC End of Sampling flag

ADC_FLAG_EOC

ADC End of Regular Conversion flag

ADC_FLAG_EOS

ADC End of Regular sequence of Conversions flag

ADC_FLAG_OVR

ADC overrun flag

ADC_FLAG_JEOC

ADC End of Injected Conversion flag

ADC_FLAG_JEOS

ADC End of Injected sequence of Conversions flag

ADC_FLAG_AWD1

ADC Analog watchdog 1 flag (main analog watchdog)

ADC_FLAG_AWD2

ADC Analog watchdog 2 flag (additional analog watchdog)

ADC_FLAG_AWD3

ADC Analog watchdog 3 flag (additional analog watchdog)

ADC_FLAG_JQOVF

ADC Injected Context Queue Overflow flag

Analog watchdog - ADC analog watchdog (AWD) number

ADC_ANALOGWATCHDOG_1

ADC analog watchdog number 1

ADC_ANALOGWATCHDOG_2

ADC analog watchdog number 2

ADC_ANALOGWATCHDOG_3

ADC analog watchdog number 3

ADC instance - Channel number

ADC_CHANNEL_0

External channel (GPIO pin) ADCx_IN0

ADC_CHANNEL_1

External channel (GPIO pin) ADCx_IN1

ADC_CHANNEL_2

External channel (GPIO pin) ADCx_IN2

ADC_CHANNEL_3

External channel (GPIO pin) ADCx_IN3

ADC_CHANNEL_4

External channel (GPIO pin) ADCx_IN4

ADC_CHANNEL_5

External channel (GPIO pin) ADCx_IN5

ADC_CHANNEL_6

External channel (GPIO pin) ADCx_IN6

ADC_CHANNEL_7

External channel (GPIO pin) ADCx_IN7

ADC_CHANNEL_8

External channel (GPIO pin) ADCx_IN8

ADC_CHANNEL_9

External channel (GPIO pin) ADCx_IN9

ADC_CHANNEL_10

External channel (GPIO pin) ADCx_IN10

ADC_CHANNEL_11

External channel (GPIO pin) ADCx_IN11

ADC_CHANNEL_12

External channel (GPIO pin) ADCx_IN12

ADC_CHANNEL_13

External channel (GPIO pin) ADCx_IN13

ADC_CHANNEL_14

External channel (GPIO pin) ADCx_IN14

ADC_CHANNEL_15

External channel (GPIO pin) ADCx_IN15

ADC_CHANNEL_16

External channel (GPIO pin) ADCx_IN16

ADC_CHANNEL_17

External channel (GPIO pin) ADCx_IN17

ADC_CHANNEL_18

External channel (GPIO pin) ADCx_IN18

ADC_CHANNEL_19

External channel (GPIO pin) ADCx_IN19

ADC_CHANNEL_VREFINT

Internal channel VrefInt: Internal voltage reference, channel specific to ADC1.

ADC_CHANNEL_TEMPSENSOR

Internal channel Temperature sensor, channel specific to ADC1.

ADC_CHANNEL_VBAT

Internal channel Vbat/4: Vbat voltage through a divider ladder of factor 1/4 to have channel voltage always below Vdda, channel specific to ADC2.

ADC_CHANNEL_VDDCORE

Internal channel Vddcore, channel specific to ADC2.

Channel - Sampling time

ADC_SAMPLETIME_2CYCLES_5

Sampling time 2.5 ADC clock cycles

ADC_SAMPLETIME_6CYCLES_5

Sampling time 6.5 ADC clock cycles

ADC_SAMPLETIME_12CYCLES_5

Sampling time 12.5 ADC clock cycles

ADC_SAMPLETIME_24CYCLES_5

Sampling time 24.5 ADC clock cycles

ADC_SAMPLETIME_47CYCLES_5

Sampling time 47.5 ADC clock cycles

ADC_SAMPLETIME_92CYCLES_5

Sampling time 92.5 ADC clock cycles

ADC_SAMPLETIME_247CYCLES_5

Sampling time 247.5 ADC clock cycles

ADC_SAMPLETIME_640CYCLES_5

Sampling time 640.5 ADC clock cycles

ADC_SAMPLETIME_3CYCLES_5

Sampling time 3.5 ADC clock cycles. If selected, this sampling time replaces sampling time 2.5 ADC clock cycles. These 2 sampling times cannot be used simultaneously.

Channel - Single or differential ending

ADC_SINGLE_ENDED

ADC channel ending set to single ended

ADC_DIFFERENTIAL_ENDED

ADC channel ending set to differential

ADC common - Clock source

ADC_CLOCK_SYNC_PCLK_DIV1

ADC synchronous clock from AHB clock without prescaler

ADC_CLOCK_SYNC_PCLK_DIV2

ADC synchronous clock from AHB clock with prescaler division by 2

ADC_CLOCK_SYNC_PCLK_DIV4

ADC synchronous clock from AHB clock with prescaler division by 4

ADC_CLOCK_ASYNC_DIV1

ADC asynchronous clock without prescaler

ADC_CLOCK_ASYNC_DIV2

ADC asynchronous clock with prescaler division by 2

ADC_CLOCK_ASYNC_DIV4

ADC asynchronous clock with prescaler division by 4

ADC_CLOCK_ASYNC_DIV6

ADC asynchronous clock with prescaler division by 6

ADC_CLOCK_ASYNC_DIV8

ADC asynchronous clock with prescaler division by 8

ADC_CLOCK_ASYNC_DIV10

ADC asynchronous clock with prescaler division by 10

ADC_CLOCK_ASYNC_DIV12

ADC asynchronous clock with prescaler division by 12

ADC_CLOCK_ASYNC_DIV16

ADC asynchronous clock with prescaler division by 16

ADC_CLOCK_ASYNC_DIV32

ADC asynchronous clock with prescaler division by 32

ADC_CLOCK_ASYNC_DIV64

ADC asynchronous clock with prescaler division by 64

ADC_CLOCK_ASYNC_DIV128

ADC asynchronous clock with prescaler division by 128

ADC_CLOCK_ASYNC_DIV256

ADC asynchronous clock with prescaler division by 256

ADC conversion data alignment

ADC_DATAALIGN_RIGHT

ADC conversion data alignment: right aligned (alignment on data register LSB bit 0)

ADC_DATAALIGN_LEFT

ADC conversion data alignment: left aligned (alignment on data register MSB bit 15)

ADC instance - Groups

ADC_REGULAR_GROUP

ADC group regular (available on all STM32 devices)

ADC_INJECTED_GROUP

ADC group injected (not available on all STM32 devices)

ADC_REGULAR_INJECTED_GROUP

ADC both groups regular and injected

Multimode - DMA transfer mode depending on ADC resolution

ADC_DMAACCESSMODE_DISABLED

DMA multimode disabled: each ADC uses its own DMA channel

ADC_DMAACCESSMODE_12_10_BITS

DMA multimode enabled (one DMA channel for both ADC, DMA of ADC master) for 12 and 10 bits resolution

ADC_DMAACCESSMODE_8_6_BITS

DMA multimode enabled (one DMA channel for both ADC, DMA of ADC master) for 8 and 6 bits resolution

Multimode - Mode

ADC_MODE_INDEPENDENT

ADC dual mode disabled (ADC independent mode)

ADC_DUALMODE_REGSIMULT

ADC dual mode enabled: group regular simultaneous

ADC_DUALMODE_INTERL

ADC dual mode enabled: Combined group regular interleaved

ADC_DUALMODE_INJECSIMULT

ADC dual mode enabled: group injected simultaneous

ADC_DUALMODE_ALTERTRIG

ADC dual mode enabled: group injected alternate trigger. Works only with external triggers (not internal SW start)

ADC_DUALMODE_REGSIMULT_INJECSIMULT

ADC dual mode enabled: Combined group regular simultaneous + group injected simultaneous

ADC_DUALMODE_REGSIMULT_ALTERTRIG

ADC dual mode enabled: Combined group regular simultaneous + group injected alternate trigger

ADC_DUALMODE_REGINTERL_INJECSIMULT

ADC dual mode enabled: Combined group regular interleaved + group injected simultaneous

Multimode - Delay between two sampling phases

ADC_TWOSAMPLINGDELAY_1CYCLE

ADC multimode delay between two sampling phases: 1 ADC clock cycle

ADC_TWOSAMPLINGDELAY_2CYCLES

ADC multimode delay between two sampling phases: 2 ADC clock cycles

ADC_TWOSAMPLINGDELAY_3CYCLES

ADC multimode delay between two sampling phases: 3 ADC clock cycles

ADC_TWOSAMPLINGDELAY_4CYCLES

ADC multimode delay between two sampling phases: 4 ADC clock cycles

ADC_TWOSAMPLINGDELAY_5CYCLES

ADC multimode delay between two sampling phases: 5 ADC clock cycles

ADC_TWOSAMPLINGDELAY_6CYCLES

ADC multimode delay between two sampling phases: 6 ADC clock cycles

ADC_TWOSAMPLINGDELAY_7CYCLES

ADC multimode delay between two sampling phases: 7 ADC clock cycles

ADC_TWOSAMPLINGDELAY_8CYCLES

ADC multimode delay between two sampling phases: 8 ADC clock cycles

ADC_TWOSAMPLINGDELAY_9CYCLES

ADC multimode delay between two sampling phases: 9 ADC clock cycles

ADC_TWOSAMPLINGDELAY_10CYCLES

ADC multimode delay between two sampling phases: 10 ADC clock cycles

ADC_TWOSAMPLINGDELAY_11CYCLES

ADC multimode delay between two sampling phases: 11 ADC clock cycles

ADC_TWOSAMPLINGDELAY_12CYCLES

ADC multimode delay between two sampling phases: 12 ADC clock cycles

ADC instance - Offset number

ADC_OFFSET_NONE

ADC offset disabled: no offset correction for the selected ADC channel

ADC_OFFSET_1

ADC offset number 1: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_2

ADC offset number 2: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_3

ADC offset number 3: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_4

ADC offset number 4: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

Oversampling - Discontinuous mode

ADC_TRIGGEREDMODE_SINGLE_TRIGGER

ADC oversampling discontinuous mode: continuous mode (all conversions of OVS ratio are done from 1 trigger)

ADC_TRIGGEREDMODE_MULTI_TRIGGER

ADC oversampling discontinuous mode: discontinuous mode (each conversion of OVS ratio needs a trigger)

Oversampling - Ratio

ADC_OVERSAMPLING_RATIO_2

Notes:

- The oversampling ratio is the number of ADC conversions performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift) ADC oversampling ratio 2

ADC_OVERSAMPLING_RATIO_4

ADC oversampling ratio 4

ADC_OVERSAMPLING_RATIO_8

ADC oversampling ratio 8

ADC_OVERSAMPLING_RATIO_16

ADC oversampling ratio 16

ADC_OVERSAMPLING_RATIO_32

ADC oversampling ratio 32

ADC_OVERSAMPLING_RATIO_64

ADC oversampling ratio 64

ADC_OVERSAMPLING_RATIO_128

ADC oversampling ratio 128

ADC_OVERSAMPLING_RATIO_256

ADC oversampling ratio 256

Oversampling - Oversampling scope for ADC group regular

ADC_REGOVERSAMPLING_CONTINUED_MODE

Oversampling buffer maintained during injection sequence

ADC_REGOVERSAMPLING_RESUMED_MODE

Oversampling buffer zeroed during injection sequence

Oversampling - Data shift

ADC_RIGHTBITSHIFT_NONE

Notes:

- The sum of the ADC conversions data is divided by "Rightbitshift" number to result as the ADC oversampling conversion data) ADC oversampling no shift

ADC_RIGHTBITSHIFT_1

ADC oversampling right shift of 1 ranks

ADC_RIGHTBITSHIFT_2

ADC oversampling right shift of 2 ranks

ADC_RIGHTBITSHIFT_3

ADC oversampling right shift of 3 ranks

ADC_RIGHTBITSHIFT_4

ADC oversampling right shift of 4 ranks

ADC_RIGHTBITSHIFT_5

ADC oversampling right shift of 5 ranks

ADC_RIGHTBITSHIFT_6

ADC oversampling right shift of 6 ranks

ADC_RIGHTBITSHIFT_7

ADC oversampling right shift of 7 ranks

ADC_RIGHTBITSHIFT_8

ADC oversampling right shift of 8 ranks

ADC group regular - Overrun behavior on conversion data

ADC_OVR_DATA_PRESERVED

ADC group regular behavior in case of overrun: data preserved

ADC_OVR_DATA_OVERWRITTEN

ADC group regular behavior in case of overrun: data overwritten

ADC group regular - Sequencer ranks

ADC_REGULAR_RANK_1

ADC group regular sequencer rank 1

ADC_REGULAR_RANK_2

ADC group regular sequencer rank 2

ADC_REGULAR_RANK_3

ADC group regular sequencer rank 3

ADC_REGULAR_RANK_4

ADC group regular sequencer rank 4

ADC_REGULAR_RANK_5

ADC group regular sequencer rank 5

ADC_REGULAR_RANK_6

ADC group regular sequencer rank 6

ADC_REGULAR_RANK_7

ADC group regular sequencer rank 7

ADC_REGULAR_RANK_8

ADC group regular sequencer rank 8

ADC_REGULAR_RANK_9

ADC group regular sequencer rank 9

ADC_REGULAR_RANK_10

ADC group regular sequencer rank 10

ADC_REGULAR_RANK_11

ADC group regular sequencer rank 11

ADC_REGULAR_RANK_12

ADC group regular sequencer rank 12

ADC_REGULAR_RANK_13

ADC group regular sequencer rank 13

ADC_REGULAR_RANK_14

ADC group regular sequencer rank 14

ADC_REGULAR_RANK_15

ADC group regular sequencer rank 15

ADC_REGULAR_RANK_16

ADC group regular sequencer rank 16

ADC instance - Resolution

ADC_RESOLUTION_12B

ADC resolution 12 bits

ADC_RESOLUTION_10B

ADC resolution 10 bits

ADC_RESOLUTION_8B

ADC resolution 8 bits

ADC_RESOLUTION_6B

ADC resolution 6 bits

HAL ADC macro to manage HAL ADC handle, IT and flags.

__HAL_ADC_RESET_HANDLE_STATE

Description:

- Reset ADC handle state.

Parameters:

- __HANDLE__: ADC handle

Return value:

- None

__HAL_ADC_ENABLE_IT

Description:

- Enable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_JQOVF ADC Injected Context Queue Overflow interrupt source.

Return value:

- None

__HAL_ADC_DISABLE_IT

Description:

- Disable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_JQOVF ADC Injected Context Queue Overflow interrupt source.

Return value:

- None

__HAL_ADC_GET_IT_SOURCE

Description:

- Checks if the specified ADC interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC interrupt source to check This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_JQOVF ADC Injected Context Queue Overflow interrupt source.

Return value:

- State: of interruption (SET or RESET)

__HAL_ADC_GET_FLAG

Description:

- Check whether the specified ADC flag is set or not.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)
  - ADC_FLAG_JQOVF ADC Injected Context Queue Overflow flag.

Return value:

- State: of flag (TRUE or FALSE).

__HAL_ADC_CLEAR_FLAG

Description:

- Clear the specified ADC flag.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)
  - ADC_FLAG_JQOVF ADC Injected Context Queue Overflow flag.

Return value:

- None

HAL ADC helper macro

__HAL_ADC_CHANNEL_TO_DECIMAL_NB

Description:

- Helper macro to get ADC channel number in decimal format from literals ADC_CHANNEL_x.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VDDCORE (2)

Return value:

- Value: between Min_Data=0 and Max_Data=18

Notes:

- Example: __HAL_ADC_CHANNEL_TO_DECIMAL_NB(ADC_CHANNEL_4) will return decimal number "4". The input can be a value from functions where a channel number is returned, either defined with number or with bitfield (only one bit must be set).

__HAL_ADC_DECIMAL_NB_TO_CHANNEL

Description:

- Helper macro to get ADC channel in literal format ADC_CHANNEL_x from number in decimal format.

Parameters:

- __DECIMAL_NB__: Value between Min_Data=0 and Max_Data=18

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)(4)
  - ADC_CHANNEL_TEMPSENSOR (1)(4)
  - ADC_CHANNEL_VBAT (2)(4)
  - ADC_CHANNEL_VDDCORE (2)(4)

Notes:

- Example: __HAL_ADC_DECIMAL_NB_TO_CHANNEL(4) will return a data equivalent to "ADC_CHANNEL_4".

__HAL_ADC_IS_CHANNEL_INTERNAL

Description:

- Helper macro to determine whether the selected channel corresponds to literal definitions of driver.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VDDCORE (2)

Return value:

- Value: "0" if the channel corresponds to a parameter definition of a ADC external channel (channel connected to a GPIO pin). Value "1" if the channel corresponds to a parameter definition of a ADC internal channel.

Notes:

- The different literal definitions of ADC channels are: ADC internal channel: ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...ADC external channel (channel connected to a GPIO pin): ADC_CHANNEL_1, ADC_CHANNEL_2, ... The channel parameter must be a value defined from literal definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...), must not be a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_CHANNEL_INTERNAL_TO_EXTERNAL

Description:

- Helper macro to convert a channel defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), to its equivalent parameter definition of a ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...).

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VDDCORE (2)

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18

Notes:

- The channel parameter can be, additionally to a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers.

__HAL_ADC_IS_CHANNEL_INTERNAL_AVAILABLE

Description:

- Helper macro to determine whether the internal channel selected is available on the ADC instance selected.

Parameters:

- __ADC_INSTANCE__: ADC instance
- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VDDCORE (2)

Return value:

- Value: "0" if the internal channel selected is not available on the ADC instance selected. Value "1" if the internal channel selected is available on the ADC instance selected.

Notes:

- The channel parameter must be a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), must not be a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_MULTI_CONV_DATA_MASTER_SLAVE

Description:

- Helper macro to get the ADC multimode conversion data of ADC master or ADC slave from raw value with both ADC conversion data concatenated.

Parameters:

- __ADC_MULTI_MASTER_SLAVE__: This parameter can be one of the following values:
  - LL_ADC_MULTI_MASTER
  - LL_ADC_MULTI_SLAVE
- __ADC_MULTI_CONV_DATA__: Value between Min_Data=0x000 and Max_Data=0xFFF

Return value:

- Value: between Min_Data=0x000 and Max_Data=0xFFF

Notes:

- This macro is intended to be used when multimode transfer by DMA is enabled: refer to function LL_ADC_SetMultiDMATransfer(). In this case the transferred data need to processed with this macro to separate the conversion data of ADC master and ADC slave.

__HAL_ADC_COMMON_INSTANCE

Description:

- Helper macro to select the ADC common instance to which is belonging the selected ADC instance.

Parameters:

- __ADCx__: ADC instance

Return value:

- ADC: common register instance

Notes:

- ADC common register instance can be used for: Set parameters common to several ADC instancesMultimode (for devices with several ADC instances) Refer to functions having argument "ADCxy_COMMON" as parameter.

__HAL_ADC_IS_ENABLED_ALL_COMMON_INSTANCE

Description:

- Helper macro to check if all ADC instances sharing the same ADC common instance are disabled.

Parameters:

- __ADCXY_COMMON__: ADC common instance (can be set directly from CMSIS definition or by using helper macro

Return value:

- Value: "0" if all ADC instances sharing the same ADC common instance are disabled. Value "1" if at least one ADC instance sharing the same ADC common instance is enabled.

Notes:

- This check is required by functions with setting conditioned to ADC state: All ADC instances of the ADC common group must be disabled. Refer to functions having argument "ADCxy_COMMON" as parameter. On devices with only 1 ADC common instance, parameter of this macro is useless and can be ignored (parameter kept for compatibility with devices featuring several ADC common instances).

__HAL_ADC_DIGITAL_SCALE

Description:

- Helper macro to define the ADC conversion data full-scale digital value corresponding to the selected ADC resolution.

Parameters:

- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data full-scale digital value

Notes:

- ADC conversion data full-scale corresponds to voltage range determined by analog voltage references Vref+ and Vref- (refer to reference manual).

__HAL_ADC_CONVERT_DATA_RESOLUTION

Description:

- Helper macro to convert the ADC conversion data from a resolution to another resolution.

Parameters:

- __DATA__: ADC conversion data to be converted
- __ADC_RESOLUTION_CURRENT__: Resolution of to the data to be converted This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B
- __ADC_RESOLUTION_TARGET__: Resolution of the data after conversion This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data to the requested resolution

__HAL_ADC_CALC_DATA_TO_VOLTAGE

Description:

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value).

Parameters:

- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __ADC_DATA__: ADC conversion data (resolution 12 bits) (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data equivalent voltage value (unit: mVolt)

Notes:

- Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE().

__HAL_ADC_CALC_VREFANALOG_VOLTAGE

Description:

- Helper macro to calculate analog reference voltage (Vref+) (unit: mVolt) from ADC conversion data of internal voltage reference VrefInt.

Parameters:

- __VREFINT_ADC_DATA__: ADC conversion data (resolution 12 bits) of internal voltage reference VrefInt (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- Analog: reference voltage (unit: mV)

Notes:

- Computation is using VrefInt calibration value stored in system memory for each device during production. This voltage depends on user board environment: voltage level connected to pin Vref+. On devices with small package, the pin Vref+ is not present and internally bonded to pin Vdda. On this STM32 series, calibration data of internal voltage reference VrefInt corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of internal voltage reference VrefInt. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

__HAL_ADC_CALC_TEMPERATURE

Description:

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

Parameters:

- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __TEMPSENSOR_ADC_DATA__: ADC conversion data of internal temperature sensor (unit: digital value).
- __ADC_RESOLUTION__: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- Temperature: (unit: degree Celsius)

Notes:

- Computation is using temperature sensor calibration values stored in system memory for each device during production. Calculation formula: Temperature = ((TS_ADC_DATA - TS_CAL1) * (TS_CAL2_TEMP - TS_CAL1_TEMP)) / (TS_CAL2 - TS_CAL1) + TS_CAL1_TEMP with TS_ADC_DATA = temperature sensor raw data measured by ADC Avg_Slope = (TS_CAL2 - TS_CAL1) / (TS_CAL2_TEMP - TS_CAL1_TEMP) TS_CAL1 = equivalent TS_ADC_DATA at temperature TEMP_DEGC_CAL1 (calibrated in factory) TS_CAL2 = equivalent TS_ADC_DATA at temperature TEMP_DEGC_CAL2 (calibrated in factory) Caution: Calculation relevancy under reserve that calibration parameters are correct (address and data). To calculate temperature using temperature sensor datasheet typical values (generic values less, therefore less accurate than calibrated values), use helper macro __LL_ADC_CALC_TEMPERATURE_TYP_PARAMS(). As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE(). On this STM32 series, calibration data of temperature sensor corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of temperature sensor. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

__HAL_ADC_CALC_TEMPERATURE_TYP_PARAMS

Description:

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

Parameters:

- __TEMPSENSOR_TYP_AVGSLOPE__: Device datasheet data: Temperature sensor slope typical value (unit: uV/DegCelsius). On this STM32 series, refer to device datasheet parameter "Avg_Slope".
- __TEMPSENSOR_TYP_CALX_V__: Device datasheet data: Temperature sensor voltage typical value (at temperature and Vref+ defined in parameters below) (unit: mV). On this STM32 series, refer to device datasheet parameter "V30" (corresponding to TS_CAL1).
- __TEMPSENSOR_CALX_TEMP__: Device datasheet data: Temperature at which temperature sensor voltage (see parameter above) is corresponding (unit: mV)
- __VREFANALOG_VOLTAGE__: Analog voltage reference (Vref+) voltage (unit: mV)
- __TEMPSENSOR_ADC_DATA__: ADC conversion data of internal temperature sensor (unit: digital value).
- __ADC_RESOLUTION__: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- Temperature: (unit: degree Celsius)

Notes:

- Computation is using temperature sensor typical values (refer to device datasheet). Calculation formula: Temperature = (TS_TYP_CALx_VOLT(uV) - TS_ADC_DATA * Conversion_uV) / Avg_Slope + CALx_TEMP with TS_ADC_DATA = temperature sensor raw data measured by ADC (unit: digital value) Avg_Slope = temperature sensor slope (unit: uV/Degree Celsius) TS_TYP_CALx_VOLT = temperature sensor digital value at temperature CALx_TEMP (unit: mV) Caution: Calculation relevancy under reserve the temperature sensor of the current device has characteristics in line with datasheet typical values. If temperature sensor calibration values are available on on this device (presence of macro __LL_ADC_CALC_TEMPERATURE()), temperature calculation will be more accurate using helper macro __LL_ADC_CALC_TEMPERATURE(). As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE(). ADC measurement data must correspond to a resolution of 12bits (full scale digital value 4095). If not the case, the data must be preliminarily rescaled to an equivalent resolution of 12 bits.

ADC group injected trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGINJECCONV_EDGE_NONE

Injected conversions trigger disabled (SW start)

ADC_EXTERNALTRIGINJECCONV_EDGE_RISING

Injected conversions trigger polarity set to rising edge

ADC_EXTERNALTRIGINJECCONV_EDGE_FALLING

Injected conversions trigger polarity set to falling edge

ADC_EXTERNALTRIGINJECCONV_EDGE_RISINGFALLING

Injected conversions trigger polarity set to both rising and falling edges

ADC group injected trigger source

ADC_INJECTED_SOFTWARE_START

ADC group injected conversion trigger software start

ADC_EXTERNALTRIGINJEC_T1_TRGO

ADC group injected conversion trigger from external peripheral: TIM1 TRGO event.

ADC_EXTERNALTRIGINJEC_T1_CC4

ADC group injected conversion trigger from external peripheral: TIM1 channel 4 event (capture compare).

ADC_EXTERNALTRIGINJEC_T2_TRGO

ADC group injected conversion trigger from external peripheral: TIM2 TRGO event.

ADC_EXTERNALTRIGINJEC_T2_CC1

ADC group injected conversion trigger from external peripheral: TIM2 channel 1 event (capture compare).

ADC_EXTERNALTRIGINJEC_T3_CC4

ADC group injected conversion trigger from external peripheral: TIM3 channel 4 event (capture compare).

ADC_EXTERNALTRIGINJEC_EXT_IT15

ADC group injected conversion trigger from external peripheral: external interrupt line 15.

ADC_EXTERNALTRIGINJEC_T1_TRGO2

ADC group injected conversion trigger from external peripheral: TIM1 TRGO2 event.

ADC_EXTERNALTRIGINJEC_T3_CC3

ADC group injected conversion trigger from external peripheral: TIM3 channel 3 event (capture compare).

ADC_EXTERNALTRIGINJEC_T3_TRGO

ADC group injected conversion trigger from external peripheral: TIM3 TRGO event.

ADC_EXTERNALTRIGINJEC_T3_CC1

ADC group injected conversion trigger from external peripheral: TIM3 channel 1 event (capture compare).

ADC_EXTERNALTRIGINJEC_T6_TRGO

ADC group injected conversion trigger from external peripheral: TIM6 TRGO event.

ADC_EXTERNALTRIGINJEC_LPTIM1_CH1

ADC group injected conversion trigger from external peripheral: LPTIM1 channel 1 event.

ADC_EXTERNALTRIGINJEC_LPTIM2_CH1

ADC group injected conversion trigger from external peripheral: LPTIM2 channel 1 event.

ADC_EXTERNALTRIGINJEC_T4_TRGO

ADC group injected conversion trigger from external peripheral: TIM4 TRGO event. Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIGINJEC_T8_CC4

ADC group injected conversion trigger from external peripheral: TIM8 channel 4 event (capture compare).

ADC_EXTERNALTRIGINJEC_T8_TRGO

ADC group injected conversion trigger from external peripheral: TIM8 TRGO event. Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIGINJEC_T8_TRGO2

ADC group injected conversion trigger from external peripheral: TIM8 TRGO2 event. Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIGINJEC_T15_TRGO

ADC group injected conversion trigger from external peripheral: TIM15 TRGO event. Specific to devices STM32H563/H573xx.

ADC group injected - Sequencer ranks

ADC_INJECTED_RANK_1

ADC group injected sequencer rank 1

ADC_INJECTED_RANK_2

ADC group injected sequencer rank 2

ADC_INJECTED_RANK_3

ADC group injected sequencer rank 3

ADC_INJECTED_RANK_4

ADC group injected sequencer rank 4

ADC interrupts definition

ADC_IT_RDY

ADC Ready interrupt source

ADC_IT_EOSMP

ADC End of sampling interrupt source

ADC_IT_EOC

ADC End of regular conversion interrupt source

ADC_IT_EOS

ADC End of regular sequence of conversions interrupt source

ADC_IT_OVR

ADC overrun interrupt source

ADC_IT_JEOC

ADC End of injected conversion interrupt source

ADC_IT_JEOS

ADC End of injected sequence of conversions interrupt source

ADC_IT_AWD1

ADC Analog watchdog 1 interrupt source (main analog watchdog)

ADC_IT_AWD2

ADC Analog watchdog 2 interrupt source (additional analog watchdog)

ADC_IT_AWD3

ADC Analog watchdog 3 interrupt source (additional analog watchdog)

ADC_IT_JQOVF

ADC Injected Context Queue Overflow interrupt source

ADC group regular trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGCONVEDGE_NONE

ADC group regular trigger disabled (SW start)

ADC_EXTERNALTRIGCONVEDGE_RISING

ADC group regular conversion trigger polarity set to rising edge

ADC_EXTERNALTRIGCONVEDGE_FALLING

ADC group regular conversion trigger polarity set to falling edge

ADC_EXTERNALTRIGCONVEDGE_RISINGFALLING

ADC group regular conversion trigger polarity set to both rising and falling edges

ADC group regular trigger source

ADC_SOFTWARE_START

ADC group regular conversion trigger software start

ADC_EXTERNALTRIG_T1_CC1

ADC group regular conversion trigger from external peripheral: TIM1 channel 1 event (capture compare).

ADC_EXTERNALTRIG_T1_CC2

ADC group regular conversion trigger from external peripheral: TIM1 channel 2 event (capture compare).

ADC_EXTERNALTRIG_T1_CC3

ADC group regular conversion trigger from external peripheral: TIM1 channel 3 event (capture compare).

ADC_EXTERNALTRIG_T2_CC2

ADC group regular conversion trigger from external peripheral: TIM2 channel 2 event (capture compare).

ADC_EXTERNALTRIG_T3_TRGO

ADC group regular conversion trigger from external peripheral: TIM3 TRGO event.

ADC_EXTERNALTRIG_EXT_IT11

ADC group regular conversion trigger from external peripheral: external interrupt line 11 event.

ADC_EXTERNALTRIG_T1_TRGO

ADC group regular conversion trigger from external peripheral: TIM1 TRGO event.

ADC_EXTERNALTRIG_T1_TRGO2

ADC group regular conversion trigger from external peripheral: TIM1 TRGO2 event.

ADC_EXTERNALTRIG_T2_TRGO

ADC group regular conversion trigger from external peripheral: TIM2 TRGO event.

ADC_EXTERNALTRIG_T6_TRGO

ADC group regular conversion trigger from external peripheral: TIM6 TRGO event.

ADC_EXTERNALTRIG_T3_CC4

ADC group regular conversion trigger from external peripheral: TIM3 channel 4 event (capture compare).

ADC_EXTERNALTRIG_EXT_IT15

ADC group regular conversion trigger from external peripheral: external interrupt line 15 event.

ADC_EXTERNALTRIG_LPTIM1_CH1

ADC group regular conversion trigger from external peripheral: LPTIM1 channel 1 event.

ADC_EXTERNALTRIG_LPTIM2_CH1

ADC group regular conversion trigger from external peripheral: LPTIM2 channel 1 event.

ADC_EXTERNALTRIG_T4_CC4

ADC group regular conversion trigger from external peripheral: TIM4 channel 4 event (capture compare). Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIG_T8_TRGO

ADC group regular conversion trigger from external peripheral: TIM8 TRGO event. Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIG_T8_TRGO2

ADC group regular conversion trigger from external peripheral: TIM8 TRGO2 event. Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIG_T4_TRGO

ADC group regular conversion trigger from external peripheral: TIM4 TRGO event. Specific to devices STM32H563/H573xx.

ADC_EXTERNALTRIG_T15_TRGO

ADC group regular conversion trigger from external peripheral: TIM15 TRGO event. Specific to devices STM32H563/H573xx.

ADC group regular sampling mode

ADC_SAMPLING_MODE_NORMAL

ADC conversions sampling phase duration is defined using

ADC_SAMPLING_MODE_BULB

ADC conversions sampling phase starts immediately after end of conversion, and stops upon trigger event. Note: First conversion is using minimal sampling time (see

ADC_SAMPLING_MODE_TRIGGER_CONTROLED

ADC conversions sampling phase is controlled by trigger events: Trigger rising edge = start sampling Trigger falling edge = stop sampling and start conversion

ADC sequencer scan mode

ADC_SCAN_DISABLE

Scan mode disabled

ADC_SCAN_ENABLE

Scan mode enabled

ADCx SMPR1 fields

ADC_SMPR1_FIELDS

ADC States

HAL_ADC_STATE_RESET

Notes:

- ADC state machine is managed by bitfields, state must be compared with bit by bit. For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) " ADC not yet initialized or disabled

HAL_ADC_STATE_READY

ADC peripheral ready for use

HAL_ADC_STATE_BUSY_INTERNAL

ADC is busy due to an internal process (initialization, calibration, ...)

HAL_ADC_STATE_TIMEOUT

TimeOut occurrence

HAL_ADC_STATE_ERROR_INTERNAL

Internal error occurrence

HAL_ADC_STATE_ERROR_CONFIG

Configuration error occurrence

HAL_ADC_STATE_ERROR_DMA

DMA error occurrence

HAL_ADC_STATE_REG_BUSY

A conversion on ADC group regular is ongoing or can occur (either by continuous mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_REG_EOC

Conversion data available on group regular

HAL_ADC_STATE_REG_OVR

Overrun occurrence

HAL_ADC_STATE_REG_EOSMP

Not available on this STM32 series: End Of Sampling flag raised

HAL_ADC_STATE_INJ_BUSY

A conversion on ADC group injected is ongoing or can occur (either by auto-injection mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_INJ_EOC

Conversion data available on group injected

HAL_ADC_STATE_INJ_JQOVF

Injected queue overflow occurrence

HAL_ADC_STATE_AWD1

Out-of-window occurrence of ADC analog watchdog 1

HAL_ADC_STATE_AWD2

Out-of-window occurrence of ADC analog watchdog 2

HAL_ADC_STATE_AWD3

Out-of-window occurrence of ADC analog watchdog 3

HAL_ADC_STATE_MULTIMODE_SLAVE

ADC in multimode slave state, controlled by another ADC master (when feature available)

8 HAL ADC Extension Driver

8.1 ADCEx Firmware driver registers structures

8.1.1 ADC_InjOversamplingTypeDef

ADC_InjOversamplingTypeDef is defined in the stm32h5xx_hal_adc_ex.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***

Field Documentation

- ***uint32_t ADC_InjOversamplingTypeDef::Ratio***
  Configures the oversampling ratio. This parameter can be a value of ***ADC_HAL_EC_OVS_RATIO***
- ***uint32_t ADC_InjOversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***

8.1.2 ADC_InjectionConfTypeDef

ADC_InjectionConfTypeDef is defined in the stm32h5xx_hal_adc_ex.h

Data Fields

- ***uint32_t InjectedChannel***
- ***uint32_t InjectedRank***
- ***uint32_t InjectedSamplingTime***
- ***uint32_t InjectedSingleDiff***
- ***uint32_t InjectedOffsetNumber***
- ***uint32_t InjectedOffset***
- ***uint32_t InjectedOffsetSign***
- ***FunctionalState InjectedOffsetSaturation***
- ***uint32_t InjectedNbrOfConversion***
- ***FunctionalState InjectedDiscontinuousConvMode***
- ***FunctionalState AutoInjectedConv***
- ***FunctionalState QueueInjectedContext***
- ***uint32_t ExternalTrigInjecConv***
- ***uint32_t ExternalTrigInjecConvEdge***
- ***FunctionalState InjecOversamplingMode***
- ***ADC_InjOversamplingTypeDef InjecOversampling***

Field Documentation

- ***uint32_t ADC_InjectionConfTypeDef::InjectedChannel***
  Specifies the channel to configure into ADC group injected. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedRank***
  Specifies the rank in the ADC group injected sequencer. This parameter must be a value of ***ADC_INJ_SEQ_RANKS***. Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)

- ***uint32_t ADC_InjectionConfTypeDef::InjectedSamplingTime***
  Sampling time value to be set for the selected channel. Unit: ADC clock cycles. Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt, ...), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting). Refer to device datasheet for timings values.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedSingleDiff***
  Selection of single-ended or differential input. In differential mode: Differential measurement is between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetNumber***
  Selects the offset number. This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB***. Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffset***
  Defines the offset to be applied on the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetSign***
  Define if the offset should be subtracted (negative sign) or added (positive sign) from or to the raw converted data. This parameter can be a value of ***ADCEx_OffsetSign***. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedOffsetSaturation***
  Define if the offset should be saturated upon under or over flow. This parameter value can be ENABLE or DISABLE. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_InjectionConfTypeDef::InjectedNbrOfConversion***
  Specifies the number of ranks that will be converted within the ADC group injected sequencer. To use the injected group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 4. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedDiscontinuousConvMode***
  Specifies whether the conversions sequence of ADC group injected is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). Note: For injected group, discontinuous mode converts the sequence channel by channel (discontinuous length fixed to 1 rank). Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***FunctionalState ADC_InjectionConfTypeDef::AutoInjectedConv***
  Enables or disables the selected ADC group injected automatic conversion after regular one This parameter can be set to ENABLE or DISABLE. Note: To use Automatic injected conversion, discontinuous mode must be disabled ('DiscontinuousConvMode' and 'InjectedDiscontinuousConvMode' set to DISABLE) Note: To use Automatic injected conversion, injected group external triggers must be disabled ('ExternalTrigInjecConv' set to ADC_INJECTED_SOFTWARE_START) Note: In case of DMA used with regular group: if DMA configured in normal mode (single shot) JAUTO will be stopped upon DMA transfer complete. To maintain JAUTO always enabled, DMA must be configured in circular mode. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::QueueInjectedContext***
  Specifies whether the context queue feature is enabled. This parameter can be set to ENABLE or DISABLE. If context queue is enabled, injected sequencer&channels configurations are queued on up to 2 contexts. If a new injected context is set when queue is full, error is triggered by interruption and through function 'HAL_ADCEx_InjectedQueueOverflowCallback'. Caution: This feature request that the sequence is fully configured before injected conversion start. Therefore, configure channels with as many calls to **HAL_ADCEx_InjectedConfigChannel()** as the 'InjectedNbrOfConversion' parameter. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion).
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConv***
  Selects the external event used to trigger the conversion start of injected group. If set to ADC_INJECTED_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_injected_external_trigger_source***. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConvEdge***
  Selects the external trigger edge of injected group. This parameter can be a value of ***ADC_injected_external_trigger_edge***. If trigger source is set to ADC_INJECTED_SOFTWARE_START, this parameter is discarded. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::InjecOversamplingMode***
  Specifies whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).
- ***ADC_InjOversamplingTypeDef ADC_InjectionConfTypeDef::InjecOversampling***
  Specifies the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling already enabled. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).

8.1.3 ADC_MultiModeTypeDef

ADC_MultiModeTypeDef is defined in the stm32h5xx_hal_adc_ex.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t DMAAccessMode***
- ***uint32_t TwoSamplingDelay***

Field Documentation

- ***uint32_t ADC_MultiModeTypeDef::Mode***
  Configures the ADC to operate in independent or multimode. This parameter can be a value of ***ADC_HAL_EC_MULTI_MODE***.
- ***uint32_t ADC_MultiModeTypeDef::DMAAccessMode***
  Configures the DMA mode for multimode ADC: selection whether 2 DMA channels (each ADC uses its own DMA channel) or 1 DMA channel (one DMA channel for both ADC, DMA of ADC master). This parameter can be a value of ***ADC_HAL_EC_MULTI_DMA_TRANSFER_RESOLUTION***.

- ***uint32_t ADC_MultiModeTypeDef::TwoSamplingDelay***
  Configures the Delay between 2 sampling phases. This parameter can be a value of ***ADC_HAL_EC_MULTI_TWOSMP_DELAY***. Delay range depends on selected resolution: from 1 to 12 clock cycles for 12 bits, from 1 to 10 clock cycles for 10 bits, from 1 to 8 clock cycles for 8 bits, from 1 to 6 clock cycles for 6 bits.

8.2 ADCEx Firmware driver API description

The following section lists the various functions of the ADCEx library.

8.2.1 IO operation functions

This section provides functions allowing to:

- Perform the ADC self-calibration for single or differential ending.
- Get calibration factors for single or differential ending.
- Set calibration factors for single or differential ending.
- Start conversion of ADC group injected.
- Stop conversion of ADC group injected.
- Poll for conversion complete on ADC group injected.
- Get result of ADC group injected channel conversion.
- Start conversion of ADC group injected and enable interruptions.
- Stop conversion of ADC group injected and disable interruptions.
- When multimode feature is available, start multimode and enable DMA transfer.
- Stop multimode and disable ADC DMA transfer.
- Get result of multimode conversion.

This section contains the following APIs:

- ***HAL_ADCEx_Calibration_Start()***
- ***HAL_ADCEx_Calibration_GetValue()***
- ***HAL_ADCEx_Calibration_SetValue()***
- ***HAL_ADCEx_InjectedStart()***
- ***HAL_ADCEx_InjectedStop()***
- ***HAL_ADCEx_InjectedPollForConversion()***
- ***HAL_ADCEx_InjectedStart_IT()***
- ***HAL_ADCEx_InjectedStop_IT()***
- ***HAL_ADCEx_MultiModeStart_DMA()***
- ***HAL_ADCEx_MultiModeStop_DMA()***
- ***HAL_ADCEx_MultiModeGetValue()***
- ***HAL_ADCEx_InjectedGetValue()***
- ***HAL_ADCEx_InjectedConvCpltCallback()***
- ***HAL_ADCEx_InjectedQueueOverflowCallback()***
- ***HAL_ADCEx_LevelOutOfWindow2Callback()***
- ***HAL_ADCEx_LevelOutOfWindow3Callback()***
- ***HAL_ADCEx_EndOfSamplingCallback()***
- ***HAL_ADCEx_RegularStop()***
- ***HAL_ADCEx_RegularStop_IT()***
- ***HAL_ADCEx_RegularStop_DMA()***
- ***HAL_ADCEx_RegularMultiModeStop_DMA()***

8.2.2 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on injected group
- Configure multimode when multimode feature is available

- Enable or Disable Injected Queue
- Disable ADC voltage regulator
- Enter ADC deep-power-down mode

This section contains the following APIs:

- ***HAL_ADCEx_InjectedConfigChannel()***
- ***HAL_ADCEx_MultiModeConfigChannel()***
- ***HAL_ADCEx_EnableInjectedQueue()***
- ***HAL_ADCEx_DisableInjectedQueue()***
- ***HAL_ADCEx_DisableVoltageRegulator()***
- ***HAL_ADCEx_EnterADCDeepPowerDownMode()***

8.2.3 Detailed description of functions

HAL_ADCEx_Calibration_Start

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_Start (ADC_HandleTypeDef * hadc, uint32_t SingleDiff)

Function description

Perform an ADC automatic self-calibration Calibration prerequisite: ADC must be disabled (execute this function before HAL_ADC_Start() or after HAL_ADC_Stop()).

Parameters

- **hadc:** ADC handle
- **SingleDiff:** Selection of single-ended or differential input This parameter can be one of the following values:
  - ADC_SINGLE_ENDED Channel in mode input single ended
  - ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended

Return values

- **HAL:** status

HAL_ADCEx_Calibration_GetValue

Function name

uint32_t HAL_ADCEx_Calibration_GetValue (const ADC_HandleTypeDef * hadc, uint32_t SingleDiff)

Function description

Get the calibration factor.

Parameters

- **hadc:** ADC handle.
- **SingleDiff:** This parameter can be only:
  - ADC_SINGLE_ENDED Channel in mode input single ended
  - ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended

Return values

- **Calibration:** value.

HAL_ADCEx_Calibration_SetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_SetValue (ADC_HandleTypeDef * hadc, uint32_t SingleDiff, uint32_t CalibrationFactor)

Function description

Set the calibration factor to overwrite automatic conversion result.

Parameters

- **hadc:** ADC handle
- **SingleDiff:** This parameter can be only:
  - ADC_SINGLE_ENDED Channel in mode input single ended
  - ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended
- **CalibrationFactor:** Calibration factor (coded on 7 bits maximum)

Return values

- **HAL:** state

HAL_ADCEx_InjectedStart

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of injected group.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function: None.
- Case of multimode enabled when multimode feature is available: HAL_ADCEx_InjectedStart() API must be called for ADC slave first, then for ADC master. For ADC slave, ADC is enabled only (conversion is not started). For ADC master, ADC is enabled and multimode conversion is started.

HAL_ADCEx_InjectedStop

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop (ADC_HandleTypeDef * hadc)

Function description

Stop conversion of injected channels.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status

Notes

- If ADC must be disabled and if conversion is on going on regular group, function HAL_ADC_Stop must be used to stop both injected and regular groups, and disable the ADC.
- If injected group mode auto-injection is enabled, function HAL_ADC_Stop must be used.
- In case of multimode enabled (when multimode feature is available), HAL_ADCEx_InjectedStop() must be called for ADC master first, then for ADC slave. For ADC master, conversion is stopped and ADC is disabled. For ADC slave, ADC is disabled only (conversion stop of ADC master has already stopped conversion of ADC slave).

HAL_ADCEx_InjectedPollForConversion

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedPollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

Wait for injected group conversion to be completed.

Parameters

- **hadc:** ADC handle
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- Depending on hadc->Init.EOCSelection, JEOS or JEOC is checked and cleared depending on AUTDLY bit status.

HAL_ADCEx_InjectedStart_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart_IT (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of injected group with interruption.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status.

Notes

- Interruptions enabled in this function according to initialization setting : JEOC (end of conversion) or JEOS (end of sequence)
- Case of multimode enabled (when multimode feature is enabled): HAL_ADCEx_InjectedStart_IT() API must be called for ADC slave first, then for ADC master. For ADC slave, ADC is enabled only (conversion is not started). For ADC master, ADC is enabled and multimode conversion is started.

HAL_ADCEx_InjectedStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop conversion of injected channels, disable interruption of end-of-conversion.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- If ADC must be disabled and if conversion is on going on regular group, function HAL_ADC_Stop must be used to stop both injected and regular groups, and disable the ADC.
- If injected group mode auto-injection is enabled, function HAL_ADC_Stop must be used.
- Case of multimode enabled (when multimode feature is available): HAL_ADCEx_InjectedStop_IT() API must be called for ADC master first, then for ADC slave. For ADC master, conversion is stopped and ADC is disabled. For ADC slave, ADC is disabled only (conversion stop of ADC master has already stopped conversion of ADC slave).
- In case of auto-injection mode, HAL_ADC_Stop() must be used.

HAL_ADCEx_MultiModeStart_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStart_DMA (ADC_HandleTypeDef * hadc, uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start MultiMode conversion and transfer regular results through DMA.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)
- **pData:** Destination Buffer address.
- **Length:** Length of data to be transferred from ADC peripheral to memory (in bytes).

Return values

- **HAL:** status

Notes

- Multimode must have been previously configured using HAL_ADCEx_MultiModeConfigChannel() function. Interruptions enabled in this function: overrun, DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- State field of Slave ADC handle is not updated in this configuration: user should not rely on it for information related to Slave regular conversions.

HAL_ADCEx_MultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop multimode ADC conversion, disable ADC DMA transfer, disable ADC peripheral.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)

Return values

- **HAL:** status

Notes

- Multimode is kept enabled after this function. MultiMode DMA bits (MDMA and DMACFG bits of common CCR register) are maintained. To disable Multimode (set with HAL_ADCEx_MultiModeConfigChannel()), ADC must be reinitialized using HAL_ADC_Init() or HAL_ADC_DeInit(), or the user can resort to HAL_ADCEx_DisableMultiMode() API.
- In case of DMA configured in circular mode, function HAL_ADC_Stop_DMA() must be called after this function with handle of ADC slave, to properly disable the DMA channel.

HAL_ADCEx_MultiModeGetValue

Function name

uint32_t HAL_ADCEx_MultiModeGetValue (const ADC_HandleTypeDef * hadc)

Function description

Return the last ADC Master and Slave regular conversions results when in multimode configuration.

Parameters

- **hadc:** ADC handle of ADC Master (handle of ADC Slave must not be used)

Return values

- **The:** converted data values.

HAL_ADCEx_InjectedGetValue

Function name

uint32_t HAL_ADCEx_InjectedGetValue (const ADC_HandleTypeDef * hadc, uint32_t InjectedRank)

Function description

Get ADC injected group conversion result.

Parameters

- **hadc:** ADC handle
- **InjectedRank:** the converted ADC injected rank. This parameter can be one of the following values:
  - ADC_INJECTED_RANK_1 ADC group injected rank 1
  - ADC_INJECTED_RANK_2 ADC group injected rank 2
  - ADC_INJECTED_RANK_3 ADC group injected rank 3
  - ADC_INJECTED_RANK_4 ADC group injected rank 4

Return values

- **ADC:** group injected conversion data

Notes

- Reading register JDRx automatically clears ADC flag JEOC (ADC group injected end of unitary conversion).
- This function does not clear ADC flag JEOS (ADC group injected end of sequence conversion) Occurrence of flag JEOS rising: If sequencer is composed of 1 rank, flag JEOS is equivalent to flag JEOC.If sequencer is composed of several ranks, during the scan sequence flag JEOC only is raised, at the end of the scan sequence both flags JEOC and EOS are raised. Flag JEOS must not be cleared by this function because it would not be compliant with low power features (feature low power auto-wait, not available on all STM32 series). To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling: HAL_ADCEx_InjectedPollForConversion() or __HAL_ADC_CLEAR_FLAG(&hadc, ADC_FLAG_JEOS).

HAL_ADCEx_InjectedConvCpltCallback

Function name

void HAL_ADCEx_InjectedConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Injected conversion complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_InjectedQueueOverflowCallback

Function name

void HAL_ADCEx_InjectedQueueOverflowCallback (ADC_HandleTypeDef * hadc)

Function description

Injected context queue overflow callback.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- This callback is called if injected context queue is enabled (parameter "QueueInjectedContext" in injected channel configuration) and if a new injected context is set when queue is full (maximum 2 contexts).

HAL_ADCEx_LevelOutOfWindow2Callback

Function name

void HAL_ADCEx_LevelOutOfWindow2Callback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 2 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_LevelOutOfWindow3Callback

Function name

void HAL_ADCEx_LevelOutOfWindow3Callback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 3 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_EndOfSamplingCallback

Function name

void HAL_ADCEx_EndOfSamplingCallback (ADC_HandleTypeDef * hadc)

Function description

End Of Sampling callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_RegularStop

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected channels in case of auto_injection mode), disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADCEx_RegularStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of ADC groups regular and injected, disable interrution of end-of-conversion, disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADCEx_RegularStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable ADC DMA transfer, disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- HAL_ADCEx_RegularStop_DMA() function is dedicated to single-ADC mode only. For multimode (when multimode feature is available), HAL_ADCEx_RegularMultiModeStop_DMA() API must be used.

HAL_ADCEx_RegularMultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularMultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop DMA-based multimode ADC conversion, disable ADC DMA transfer, disable ADC peripheral if no injected conversion is on-going.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)

Return values

- **HAL:** status

Notes

- Multimode is kept enabled after this function. Multimode DMA bits (MDMA and DMACFG bits of common CCR register) are maintained. To disable multimode (set with HAL_ADCEx_MultiModeConfigChannel()), ADC must be reinitialized using HAL_ADC_Init() or HAL_ADC_DeInit(), or the user can resort to HAL_ADCEx_DisableMultiMode() API.
- In case of DMA configured in circular mode, function HAL_ADCEx_RegularStop_DMA() must be called after this function with handle of ADC slave, to properly disable the DMA channel.

HAL_ADCEx_InjectedConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedConfigChannel (ADC_HandleTypeDef * hadc, const ADC_InjectionConfTypeDef * pConfigInjected)

Function description

Configure a channel to be assigned to ADC group injected.

Parameters

- **hadc:** ADC handle
- **pConfigInjected:** Structure of ADC injected group and ADC channel for injected group.

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes injected group, following calls to this function can be used to reconfigure some parameters of structure "ADC_InjectionConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state: Refer to comments of structure "ADC_InjectionConfTypeDef".
- In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL_ADC_DeInit().
- Caution: For Injected Context Queue use, a context must be fully defined before start of injected conversion. All channels are configured consecutively for the same ADC instance. Therefore, the number of calls to HAL_ADCEx_InjectedConfigChannel() must be equal to the value of parameter InjectedNbrOfConversion for each context. Example 1: If 1 context is intended to be used (or if there is no use of the Injected Queue Context feature) and if the context contains 3 injected ranks (InjectedNbrOfConversion = 3), HAL_ADCEx_InjectedConfigChannel() must be called once for each channel (i.e. 3 times) before starting a conversion. This function must not be called to configure a 4th injected channel: it would start a new context into context queue.Example 2: If 2 contexts are intended to be used and each of them contains 3 injected ranks (InjectedNbrOfConversion = 3), HAL_ADCEx_InjectedConfigChannel() must be called once for each channel and for each context (3 channels x 2 contexts = 6 calls). Conversion can start once the 1st context is set, that is after the first three HAL_ADCEx_InjectedConfigChannel() calls. The 2nd context can be set on the fly.

HAL_ADCEx_MultiModeConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeConfigChannel (ADC_HandleTypeDef * hadc, const ADC_MultiModeTypeDef * pMultimode)

Function description

Enable ADC multimode and configure multimode parameters.

Parameters

- **hadc:** Master ADC handle
- **pMultimode:** Structure of ADC multimode configuration

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes multimode parameters, following calls to this function can be used to reconfigure some parameters of structure "ADC_MultiModeTypeDef" on the fly, without resetting the ADCs. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_MultiModeTypeDef".
- To move back configuration from multimode to single mode, ADC must be reset (using function HAL_ADC_Init()).

HAL_ADCEx_EnableInjectedQueue

Function name

HAL_StatusTypeDef HAL_ADCEx_EnableInjectedQueue (ADC_HandleTypeDef * hadc)

Function description

Enable Injected Queue.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This function resets CFGR register JQDIS bit in order to enable the Injected Queue. JQDIS can be written only when ADSTART and JDSTART are both equal to 0 to ensure that no regular nor injected conversion is ongoing.

HAL_ADCEx_DisableInjectedQueue

Function name

HAL_StatusTypeDef HAL_ADCEx_DisableInjectedQueue (ADC_HandleTypeDef * hadc)

Function description

Disable Injected Queue.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This function sets CFGR register JQDIS bit in order to disable the Injected Queue. JQDIS can be written only when ADSTART and JDSTART are both equal to 0 to ensure that no regular nor injected conversion is ongoing.

HAL_ADCEx_DisableVoltageRegulator

Function name

HAL_StatusTypeDef HAL_ADCEx_DisableVoltageRegulator (ADC_HandleTypeDef * hadc)

Function description

Disable ADC voltage regulator.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Disabling voltage regulator allows to save power. This operation can be carried out only when ADC is disabled.
- To enable again the voltage regulator, the user is expected to resort to HAL_ADC_Init() API.

HAL_ADCEx_EnterADCDeepPowerDownMode

Function name

HAL_StatusTypeDef HAL_ADCEx_EnterADCDeepPowerDownMode (ADC_HandleTypeDef * hadc)

Function description

Enter ADC deep-power-down mode.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This mode is achieved in setting DEEPPWD bit and allows to save power in reducing leakage currents. It is particularly interesting before entering stop modes.
- Setting DEEPPWD automatically clears ADVREGEN bit and disables the ADC voltage regulator. This means that this API encompasses HAL_ADCEx_DisableVoltageRegulator(). Additionally, the internal calibration is lost.
- To exit the ADC deep-power-down mode, the user is expected to resort to HAL_ADC_Init() API as well as to relaunch a calibration with HAL_ADCEx_Calibration_Start() API or to re-apply a previously saved calibration factor.

8.3 ADCEx Firmware driver defines

The following section lists the various define and macros of the module.

8.3.1 ADCEx

ADCEx

ADC Extended Exported Macros

ADC_FORCE_MODE_INDEPENDENT

Description:

- Force ADC instance in multimode mode independent (multimode disable).

Parameters:

- __HANDLE__: ADC handle.

Return value:

- None

Notes:

- This macro must be used only in case of transition from multimode to mode independent and in case of unknown previous state, to ensure ADC configuration is in mode independent. Standard way of multimode configuration change is done from HAL ADC handle of ADC master using function "HAL_ADCEx_MultiModeConfigChannel(..., ADC_MODE_INDEPENDENT)")". Usage of this macro is not the Standard way of multimode configuration and can lead to have HAL ADC handles status misaligned. Usage of this macro must be limited to cases mentioned above.

ADC Extended Offset Sign

ADC_OFFSET_SIGN_NEGATIVE

Offset sign negative, offset is subtracted

ADC_OFFSET_SIGN_POSITIVE

Offset sign positive, offset is added

9 HAL CEC Generic Driver

9.1 CEC Firmware driver registers structures

9.1.1 CEC_InitTypeDef

CEC_InitTypeDef is defined in the stm32h5xx_hal_cec.h

Data Fields

- ***uint32_t SignalFreeTime***
- ***uint32_t Tolerance***
- ***uint32_t BRERxStop***
- ***uint32_t BREErrorBitGen***
- ***uint32_t LBPEErrorBitGen***
- ***uint32_t BroadcastMsgNoErrorBitGen***
- ***uint32_t SignalFreeTimeOption***
- ***uint32_t ListenMode***
- ***uint16_t OwnAddress***
- ***uint8_t * RxBuffer***

Field Documentation

- ***uint32_t CEC_InitTypeDef::SignalFreeTime***
  Set SFT field, specifies the Signal Free Time. It can be one of CEC_Signal_Free_Time and belongs to the set {0,...,7} where 0x0 is the default configuration else means 0.5 + (SignalFreeTime - 1) nominal data bit periods
- ***uint32_t CEC_InitTypeDef::Tolerance***
  Set RXTOL bit, specifies the tolerance accepted on the received waveforms, it can be a value of CEC_Tolerance : it is either CEC_STANDARD_TOLERANCE or CEC_EXTENDED_TOLERANCE
- ***uint32_t CEC_InitTypeDef::BRERxStop***
  Set BRESTP bit CEC_BRERxStop : specifies whether or not a Bit Rising Error stops the reception. CEC_NO_RX_STOP_ON_BRE: reception is not stopped. CEC_RX_STOP_ON_BRE: reception is stopped.
- ***uint32_t CEC_InitTypeDef::BREErrorBitGen***
  Set BREGEN bit CEC_BREErrorBitGen : specifies whether or not an Error-Bit is generated on the CEC line upon Bit Rising Error detection. CEC_BRE_ERRORBIT_NO_GENERATION: no error-bit generation. CEC_BRE_ERRORBIT_GENERATION: error-bit generation if BRESTP is set.
- ***uint32_t CEC_InitTypeDef::LBPEErrorBitGen***
  Set LBPEGEN bit CEC_LBPEErrorBitGen : specifies whether or not an Error-Bit is generated on the CEC line upon Long Bit Period Error detection. CEC_LBPE_ERRORBIT_NO_GENERATION: no error-bit generation. CEC_LBPE_ERRORBIT_GENERATION: error-bit generation.
- ***uint32_t CEC_InitTypeDef::BroadcastMsgNoErrorBitGen***
  Set BRDNOGEN bit CEC_BroadCastMsgErrorBitGen : allows to avoid an Error-Bit generation on the CEC line upon an error detected on a broadcast message.It supersedes BREGEN and LBPEGEN bits for a broadcast message error handling. It can take two values:1) CEC_BROADCASTERROR_ERRORBIT_GENERATION. a) BRE detection: error-bit generation on the CEC line if BRESTP=CEC_RX_STOP_ON_BRE and BREGEN=CEC_BRE_ERRORBIT_NO_GENERATION. b) LBPE detection: error-bit generation on the CEC line if LBPGEN=CEC_LBPE_ERRORBIT_NO_GENERATION.2) CEC_BROADCASTERROR_NO_ERRORBIT_GENERATION. no error-bit generation in case neither a) nor b) are satisfied. Additionally, there is no error-bit generation in case of Short Bit Period Error detection in a broadcast message while LSTN bit is set.
- ***uint32_t CEC_InitTypeDef::SignalFreeTimeOption***
  Set SFTOP bit CEC_SFT_Option : specifies when SFT timer starts. CEC_SFT_START_ON_TXSOM SFT: timer starts when TXSOM is set by software. CEC_SFT_START_ON_TX_RX_END: SFT timer starts automatically at the end of message transmission/reception.

- ***uint32_t CEC_InitTypeDef::ListenMode***
  Set LSTN bit CEC_Listening_Mode : specifies device listening mode. It can take two values:CEC_REDUCED_LISTENING_MODE: CEC peripheral receives only message addressed to its own address (OAR). Messages addressed to different destination are ignored. Broadcast messages are always received.CEC_FULL_LISTENING_MODE: CEC peripheral receives messages addressed to its own address (OAR) with positive acknowledge. Messages addressed to different destination are received, but without interfering with the CEC bus: no acknowledge sent.
- ***uint16_t CEC_InitTypeDef::OwnAddress***
  Own addresses configuration This parameter can be a value of CEC_OWN_ADDRESS
- ***uint8_t* CEC_InitTypeDef::RxBuffer***
  CEC Rx buffer pointer

9.1.2 __CEC_HandleTypeDef

__CEC_HandleTypeDef is defined in the stm32h5xx_hal_cec.h

Data Fields

- ***CEC_TypeDef * Instance***
- ***CEC_InitTypeDef Init***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferCount***
- ***uint16_t RxXferSize***
- ***HAL_LockTypeDef Lock***
- ***HAL_CEC_StateTypeDef gState***
- ***HAL_CEC_StateTypeDef RxState***
- ***uint32_t ErrorCode***
- ***void(* TxCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***CEC_TypeDef* __CEC_HandleTypeDef::Instance***
  CEC registers base address
- ***CEC_InitTypeDef __CEC_HandleTypeDef::Init***
  CEC communication parameters
- ***const uint8_t* __CEC_HandleTypeDef::pTxBuffPtr***
  Pointer to CEC Tx transfer Buffer
- ***uint16_t __CEC_HandleTypeDef::TxXferCount***
  CEC Tx Transfer Counter
- ***uint16_t __CEC_HandleTypeDef::RxXferSize***
  CEC Rx Transfer size, 0: header received only
- ***HAL_LockTypeDef __CEC_HandleTypeDef::Lock***
  Locking object
- ***HAL_CEC_StateTypeDef __CEC_HandleTypeDef::gState***
  CEC state information related to global Handle management and also related to Tx operations. This parameter can be a value of HAL_CEC_StateTypeDef
- ***HAL_CEC_StateTypeDef __CEC_HandleTypeDef::RxState***
  CEC state information related to Rx operations. This parameter can be a value of HAL_CEC_StateTypeDef
- ***uint32_t __CEC_HandleTypeDef::ErrorCode***
  For errors handling purposes, copy of ISR register in case error is reported
- ***void(* __CEC_HandleTypeDef::TxCpltCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC Tx Transfer completed callback
- ***void(* __CEC_HandleTypeDef::RxCpltCallback)(struct __CEC_HandleTypeDef *hcec, uint32_t RxFrameSize)***
  CEC Rx Transfer completed callback

- ***void(* __CEC_HandleTypeDef::ErrorCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC error callback
- ***void(* __CEC_HandleTypeDef::MspInitCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC Msp Init callback
- ***void(* __CEC_HandleTypeDef::MspDeInitCallback)(struct __CEC_HandleTypeDef *hcec)***
  CEC Msp DeInit callback

9.2 CEC Firmware driver API description

The following section lists the various functions of the CEC library.

9.2.1 How to use this driver

The CEC HAL driver can be used as follow:

1. Declare a CEC_HandleTypeDef handle structure.
2. Initialize the CEC low level resources by implementing the HAL_CEC_MspInit ()API:
   a. Enable the CEC interface clock.
   b. CEC pins configuration:
      ◦ Enable the clock for the CEC GPIOs.
      ◦ Configure these CEC pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_CEC_Transmit_IT() and HAL_CEC_Receive_IT() APIs):
      ◦ Configure the CEC interrupt priority.
      ◦ Enable the NVIC CEC IRQ handle.
      ◦ The specific CEC interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_CEC_ENABLE_IT() and __HAL_CEC_DISABLE_IT() inside the transmit and receive process.
3. Program the Signal Free Time (SFT) and SFT option, Tolerance, reception stop in in case of Bit Rising Error, Error-Bit generation conditions, device logical address and Listen mode in the hcec Init structure.
4. Initialize the CEC registers by calling the HAL_CEC_Init() API.

Note: This API (HAL_CEC_Init()) configures also the low level Hardware (GPIO, CLOCK, CORTEX...etc) by calling the customed HAL_CEC_MspInit() API.

Callback registration

9.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the CEC

- The following parameters need to be configured:
  – SignalFreeTime
  – Tolerance
  – BRERxStop (RX stopped or not upon Bit Rising Error)
  – BREErrorBitGen (Error-Bit generation in case of Bit Rising Error)
  – LBPEErrorBitGen (Error-Bit generation in case of Long Bit Period Error)
  – BroadcastMsgNoErrorBitGen (Error-bit generation in case of broadcast message error)
  – SignalFreeTimeOption (SFT Timer start definition)
  – OwnAddress (CEC device address)
  – ListenMode

This section contains the following APIs:

- ***HAL_CEC_Init()***
- ***HAL_CEC_DeInit()***
- ***HAL_CEC_SetDeviceAddress()***
- ***HAL_CEC_MspInit()***
- ***HAL_CEC_MspDeInit()***

- *HAL_CEC_RegisterCallback()*
- *HAL_CEC_UnRegisterCallback()*
- *HAL_CEC_RegisterRxCpltCallback()*
- *HAL_CEC_UnRegisterRxCpltCallback()*

9.2.3 IO operation functions

This section contains the following APIs:

- *HAL_CEC_Transmit_IT()*
- *HAL_CEC_GetLastReceivedFrameSize()*
- *HAL_CEC_ChangeRxBuffer()*
- *HAL_CEC_IRQHandler()*
- *HAL_CEC_TxCpltCallback()*
- *HAL_CEC_RxCpltCallback()*
- *HAL_CEC_ErrorCallback()*

9.2.4 Peripheral Control function

This subsection provides a set of functions allowing to control the CEC.

- HAL_CEC_GetState() API can be helpful to check in run-time the state of the CEC peripheral.
- HAL_CEC_GetError() API can be helpful to check in run-time the error of the CEC peripheral.

This section contains the following APIs:

- *HAL_CEC_GetState()*
- *HAL_CEC_GetError()*

9.2.5 Detailed description of functions

HAL_CEC_Init

Function name

HAL_StatusTypeDef HAL_CEC_Init (CEC_HandleTypeDef * hcec)

Function description

Initializes the CEC mode according to the specified parameters in the CEC_InitTypeDef and creates the associated handle .

Parameters

- **hcec:** CEC handle

Return values

- **HAL:** status

HAL_CEC_DeInit

Function name

HAL_StatusTypeDef HAL_CEC_DeInit (CEC_HandleTypeDef * hcec)

Function description

DeInitializes the CEC peripheral.

Parameters

- **hcec:** CEC handle

Return values

- **HAL:** status

HAL_CEC_SetDeviceAddress

Function name

HAL_StatusTypeDef HAL_CEC_SetDeviceAddress (CEC_HandleTypeDef * hcec, uint16_t CEC_OwnAddress)

Function description

Initializes the Own Address of the CEC device.

Parameters

- **hcec:** CEC handle
- **CEC_OwnAddress:** The CEC own address.

Return values

- **HAL:** status

HAL_CEC_MspInit

Function name

void HAL_CEC_MspInit (CEC_HandleTypeDef * hcec)

Function description

CEC MSP Init.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_MspDeInit

Function name

void HAL_CEC_MspDeInit (CEC_HandleTypeDef * hcec)

Function description

CEC MSP DeInit.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CEC_RegisterCallback (CEC_HandleTypeDef * hcec, HAL_CEC_CallbackIDTypeDef CallbackID, pCEC_CallbackTypeDef pCallback)

Function description

Register a User CEC Callback To be used instead of the weak predefined callback.

Parameters

- **hcec:** CEC handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_CEC_TX_CPLT_CB_ID Tx Complete callback ID
  - HAL_CEC_ERROR_CB_ID Error callback ID
  - HAL_CEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_CEC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_CEC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CEC_UnRegisterCallback (CEC_HandleTypeDef * hcec, HAL_CEC_CallbackIDTypeDef CallbackID)

Function description

Unregister an CEC Callback CEC callback is redirected to the weak predefined callback.

Parameters

- **hcec:** uart handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CEC_TX_CPLT_CB_ID Tx Complete callback ID
  - HAL_CEC_ERROR_CB_ID Error callback ID
  - HAL_CEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_CEC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_CEC_RegisterRxCpltCallback

Function name

HAL_StatusTypeDef HAL_CEC_RegisterRxCpltCallback (CEC_HandleTypeDef * hcec, pCEC_RxCallbackTypeDef pCallback)

Function description

Register CEC RX complete Callback To be used instead of the weak HAL_CEC_RxCpltCallback() predefined callback.

Parameters

- **hcec:** CEC handle
- **pCallback:** pointer to the Rx transfer compelete Callback function

Return values

- **HAL:** status

HAL_CEC_UnRegisterRxCpltCallback

Function name

HAL_StatusTypeDef HAL_CEC_UnRegisterRxCpltCallback (CEC_HandleTypeDef * hcec)

Function description

UnRegister CEC RX complete Callback CEC RX complete Callback is redirected to the weak HAL_CEC_RxCpltCallback() predefined callback.

Parameters

- **hcec:** CEC handle

Return values

- **HAL:** status

HAL_CEC_Transmit_IT

Function name

HAL_StatusTypeDef HAL_CEC_Transmit_IT (CEC_HandleTypeDef * hcec, uint8_t InitiatorAddress, uint8_t DestinationAddress, const uint8_t * pData, uint32_t Size)

Function description

Send data in interrupt mode.

Parameters

- **hcec:** CEC handle
- **InitiatorAddress:** Initiator address
- **DestinationAddress:** destination logical address
- **pData:** pointer to input byte data buffer
- **Size:** amount of data to be sent in bytes (without counting the header). 0 means only the header is sent (ping operation). Maximum TX size is 15 bytes (1 opcode and up to 14 operands).

Return values

- **HAL:** status

HAL_CEC_GetLastReceivedFrameSize

Function name

uint32_t HAL_CEC_GetLastReceivedFrameSize (const CEC_HandleTypeDef * hcec)

Function description

Get size of the received frame.

Parameters

- **hcec:** CEC handle

Return values

- **Frame:** size

HAL_CEC_ChangeRxBuffer

Function name

void HAL_CEC_ChangeRxBuffer (CEC_HandleTypeDef * hcec, uint8_t * Rxbuffer)

Function description

Change Rx Buffer.

Parameters

- **hcec:** CEC handle
- **Rxbuffer:** Rx Buffer

Return values

- **Frame:** size

Notes

- This function can be called only inside the HAL_CEC_RxCpltCallback()

HAL_CEC_IRQHandler

Function name

void HAL_CEC_IRQHandler (CEC_HandleTypeDef * hcec)

Function description

This function handles CEC interrupt requests.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_TxCpltCallback

Function name

void HAL_CEC_TxCpltCallback (CEC_HandleTypeDef * hcec)

Function description

Tx Transfer completed callback.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_RxCpltCallback

Function name

void HAL_CEC_RxCpltCallback (CEC_HandleTypeDef * hcec, uint32_t RxFrameSize)

Function description

Rx Transfer completed callback.

Parameters

- **hcec:** CEC handle
- **RxFrameSize:** Size of frame

Return values

- **None:**

HAL_CEC_ErrorCallback

Function name

void HAL_CEC_ErrorCallback (CEC_HandleTypeDef * hcec)

Function description

CEC error callbacks.

Parameters

- **hcec:** CEC handle

Return values

- **None:**

HAL_CEC_GetState

Function name

HAL_CEC_StateTypeDef HAL_CEC_GetState (const CEC_HandleTypeDef * hcec)

Function description

return the CEC state

Parameters

- **hcec:** pointer to a CEC_HandleTypeDef structure that contains the configuration information for the specified CEC module.

Return values

- **HAL:** state

HAL_CEC_GetError

Function name

uint32_t HAL_CEC_GetError (const CEC_HandleTypeDef * hcec)

Function description

Return the CEC error code.

Parameters

- **hcec:** pointer to a CEC_HandleTypeDef structure that contains the configuration information for the specified CEC.

Return values

- **CEC:** Error Code

9.3 CEC Firmware driver defines

The following section lists the various define and macros of the module.

9.3.1 CEC

CEC

CEC all RX or TX errors flags

CEC_ISR_ALL_ERROR

CEC Error Bit Generation if Bit Rise Error reported

CEC_BRE_ERRORBIT_NO_GENERATION

CEC_BRE_ERRORBIT_GENERATION

CEC Reception Stop on Error

CEC_NO_RX_STOP_ON_BRE

CEC_RX_STOP_ON_BRE

CEC Error Bit Generation on Broadcast message

CEC_BROADCASTERROR_ERRORBIT_GENERATION

CEC_BROADCASTERROR_NO_ERRORBIT_GENERATION

CEC Error Code

HAL_CEC_ERROR_NONE

no error

HAL_CEC_ERROR_RXOVR

CEC Rx-Overrun

HAL_CEC_ERROR_BRE

CEC Rx Bit Rising Error

HAL_CEC_ERROR_SBPE

CEC Rx Short Bit period Error

HAL_CEC_ERROR_LBPE

CEC Rx Long Bit period Error

HAL_CEC_ERROR_RXACKE

CEC Rx Missing Acknowledge

HAL_CEC_ERROR_ARBLST

CEC Arbitration Lost

HAL_CEC_ERROR_TXUDR

CEC Tx-Buffer Underrun

HAL_CEC_ERROR_TXERR

CEC Tx-Error

HAL_CEC_ERROR_TXACKE

CEC Tx Missing Acknowledge

HAL_CEC_ERROR_INVALID_CALLBACK

Invalid Callback Error

CEC Exported Macros

__HAL_CEC_RESET_HANDLE_STATE

Description:

- Reset CEC handle gstate & RxState.

Parameters:

- __HANDLE__: CEC handle.

Return value:

- None

__HAL_CEC_GET_FLAG

Description:

- Checks whether or not the specified CEC interrupt flag is set.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __FLAG__: specifies the flag to check.
  - CEC_FLAG_TXACKE: Tx Missing acknowledge Error
  - CEC_FLAG_TXERR: Tx Error.
  - CEC_FLAG_TXUDR: Tx-Buffer Underrun.
  - CEC_FLAG_TXEND: End of transmission (successful transmission of the last byte).
  - CEC_FLAG_TXBR: Tx-Byte Request.
  - CEC_FLAG_ARBLST: Arbitration Lost
  - CEC_FLAG_RXACKE: Rx-Missing Acknowledge
  - CEC_FLAG_LBPE: Rx Long period Error
  - CEC_FLAG_SBPE: Rx Short period Error
  - CEC_FLAG_BRE: Rx Bit Rising Error
  - CEC_FLAG_RXOVR: Rx Overrun.
  - CEC_FLAG_RXEND: End Of Reception.
  - CEC_FLAG_RXBR: Rx-Byte Received.

Return value:

- ITStatus

__HAL_CEC_CLEAR_FLAG

Description:

- Clears the interrupt or status flag when raised (write at 1)

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __FLAG__: specifies the interrupt/status flag to clear. This parameter can be one of the following values:
  - CEC_FLAG_TXACKE: Tx Missing acknowledge Error
  - CEC_FLAG_TXERR: Tx Error.
  - CEC_FLAG_TXUDR: Tx-Buffer Underrun.
  - CEC_FLAG_TXEND: End of transmission (successful transmission of the last byte).
  - CEC_FLAG_TXBR: Tx-Byte Request.
  - CEC_FLAG_ARBLST: Arbitration Lost
  - CEC_FLAG_RXACKE: Rx-Missing Acknowledge
  - CEC_FLAG_LBPE: Rx Long period Error
  - CEC_FLAG_SBPE: Rx Short period Error
  - CEC_FLAG_BRE: Rx Bit Rising Error
  - CEC_FLAG_RXOVR: Rx Overrun.
  - CEC_FLAG_RXEND: End Of Reception.
  - CEC_FLAG_RXBR: Rx-Byte Received.

Return value:

- none

__HAL_CEC_ENABLE_IT

Description:

- Enables the specified CEC interrupt.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __INTERRUPT__: specifies the CEC interrupt to enable. This parameter can be one of the following values:
  - CEC_IT_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC_IT_TXERR: Tx Error IT Enable
  - CEC_IT_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC_IT_TXEND: End of transmission IT Enable
  - CEC_IT_TXBR: Tx-Byte Request IT Enable
  - CEC_IT_ARBLST: Arbitration Lost IT Enable
  - CEC_IT_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC_IT_LBPE: Rx Long period Error IT Enable
  - CEC_IT_SBPE: Rx Short period Error IT Enable
  - CEC_IT_BRE: Rx Bit Rising Error IT Enable
  - CEC_IT_RXOVR: Rx Overrun IT Enable
  - CEC_IT_RXEND: End Of Reception IT Enable
  - CEC_IT_RXBR: Rx-Byte Received IT Enable

Return value:

- none

__HAL_CEC_DISABLE_IT

Description:

- Disables the specified CEC interrupt.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __INTERRUPT__: specifies the CEC interrupt to disable. This parameter can be one of the following values:
  - CEC_IT_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC_IT_TXERR: Tx Error IT Enable
  - CEC_IT_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC_IT_TXEND: End of transmission IT Enable
  - CEC_IT_TXBR: Tx-Byte Request IT Enable
  - CEC_IT_ARBLST: Arbitration Lost IT Enable
  - CEC_IT_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC_IT_LBPE: Rx Long period Error IT Enable
  - CEC_IT_SBPE: Rx Short period Error IT Enable
  - CEC_IT_BRE: Rx Bit Rising Error IT Enable
  - CEC_IT_RXOVR: Rx Overrun IT Enable
  - CEC_IT_RXEND: End Of Reception IT Enable
  - CEC_IT_RXBR: Rx-Byte Received IT Enable

Return value:

- none

__HAL_CEC_GET_IT_SOURCE

Description:

- Checks whether or not the specified CEC interrupt is enabled.

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __INTERRUPT__: specifies the CEC interrupt to check. This parameter can be one of the following values:
  - CEC_IT_TXACKE: Tx Missing acknowledge Error IT Enable
  - CEC_IT_TXERR: Tx Error IT Enable
  - CEC_IT_TXUDR: Tx-Buffer Underrun IT Enable
  - CEC_IT_TXEND: End of transmission IT Enable
  - CEC_IT_TXBR: Tx-Byte Request IT Enable
  - CEC_IT_ARBLST: Arbitration Lost IT Enable
  - CEC_IT_RXACKE: Rx-Missing Acknowledge IT Enable
  - CEC_IT_LBPE: Rx Long period Error IT Enable
  - CEC_IT_SBPE: Rx Short period Error IT Enable
  - CEC_IT_BRE: Rx Bit Rising Error IT Enable
  - CEC_IT_RXOVR: Rx Overrun IT Enable
  - CEC_IT_RXEND: End Of Reception IT Enable
  - CEC_IT_RXBR: Rx-Byte Received IT Enable

Return value:

- FlagStatus

__HAL_CEC_ENABLE

Description:

- Enables the CEC device.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_DISABLE

Description:

- Disables the CEC device.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_FIRST_BYTE_TX_SET

Description:

- Set Transmission Start flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_LAST_BYTE_TX_SET

Description:

- Set Transmission End flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none: If the CEC message consists of only one byte, TXEOM must be set before of TXSOM.

__HAL_CEC_GET_TRANSMISSION_START_FLAG

Description:

- Get Transmission Start flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- FlagStatus

__HAL_CEC_GET_TRANSMISSION_END_FLAG

Description:

- Get Transmission End flag.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- FlagStatus

__HAL_CEC_CLEAR_OAR

Description:

- Clear OAR register.

Parameters:

- __HANDLE__: specifies the CEC Handle.

Return value:

- none

__HAL_CEC_SET_OAR

Description:

- Set OAR register (without resetting previously set address in case of multi-address mode) To reset OAR,

Parameters:

- __HANDLE__: specifies the CEC Handle.
- __ADDRESS__: Own Address value (CEC logical address is identified by bit position)

Return value:

- none

  COMP interrupt auto rearm setting

10.2 COMP Firmware driver API description

The following section lists the various functions of the COMP library.

10.2.1 COMP Peripheral features

The STM32H5xx device family integrates one analog comparator instance: COMP1.

1. Comparators input minus (inverting input) and input plus (non inverting input) can be set to internal references or to GPIO pins (refer to GPIO list in reference manual).
2. Comparators output level is available using HAL_COMP_GetOutputLevel() and can be redirected to other peripherals: GPIO pins (in mode alternate functions for comparator), timers. (refer to GPIO list in reference manual).
3. The comparators have interrupt capability through direct line to NVIC (featuring low latency interrupt).
   Caution: Specific behavior for comparator of this STM32 series: comparator output triggers interruption on high level - triggering on level (instead of edge) implies to disable interrupt in comparator IRQ handler. In case of further operation needed in interrupt mode, comparator interruption must be rearmed. - triggering on high level implies that comparator output initial state must at low level. Then, comparator can trig signal on rising edge. Trigger a signal on falling edge is possible by inverting comparator polarity.
   ==========

10.2.2 How to use this driver

This driver provides functions to configure and program the comparator instances of STM32H5xx devices. To use the comparator, perform the following steps:

1. Initialize the COMP low level resources by implementing the HAL_COMP_MspInit():
   – Configure the GPIO connected to comparator inputs plus and minus in analog mode using HAL_GPIO_Init().
   – If needed, configure the GPIO connected to comparator output in alternate function mode using HAL_GPIO_Init().
   – If required enable the COMP interrupt by configuring and enabling EXTI line in Interrupt mode and selecting the desired sensitivity level using HAL_GPIO_Init() function. After that enable the comparator interrupt vector using HAL_NVIC_EnableIRQ() function.

2. Configure the comparator using HAL_COMP_Init() function:
   – Select the input minus (inverting input)
   – Select the input plus (non-inverting input)
   – Select the hysteresis
   – Select the blanking source
   – Select the output polarity
   – Select the power mode

Note: HAL_COMP_Init() calls "HAL_COMP_MspInit()", COMP clock enable using system RCC must be implemented in this function.

3. Reconfiguration on-the-fly of comparator can be done by calling again function HAL_COMP_Init() with new input structure parameters values.
4. Enable the comparator using HAL_COMP_Start(), HAL_COMP_Start_IT_OneShot() or HAL_COMP_Start_IT_AutoRearm() Note: Using HAL_COMP_Start_IT_OneShot() or HAL_COMP_Start_IT_AutoRearm(), these functions can change comparator output polarity to match initial comparator output level constraint. Note: Using HAL_COMP_Start_IT_OneShot(), after each interruption triggered the interruption is disabled in IRQ handler. If needed, compararor interruption can be rearmed by calling again start function. Note: In case of comparator and interruption used to exit from low power mode, user most ensure of stable comparator input voltage (risk would be that comparator trigs early and IT disabled in IRQ handler before device entering in low power mode, inducing no further system wake up possible). Most appropriate function is HAL_COMP_Start_IT_AutoRearm() because compararor triggers remains enable, ensuring system wake up capability.
5. Use HAL_COMP_TriggerCallback() or HAL_COMP_GetOutputLevel() functions to manage comparator outputs (events and output level).
6. Disable the comparator using HAL_COMP_Stop() or HAL_COMP_Stop_IT() functions.
7. De-initialize the comparator using HAL_COMP_DeInit() function.
8. For safety purpose, comparator configuration can be locked using HAL_COMP_Lock() function. The only way to unlock the comparator is a device hardware reset.

Callback registration

The compilation flag USE_HAL_COMP_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_COMP_RegisterCallback() to register an interrupt callback.

Function HAL_COMP_RegisterCallback() allows to register following callbacks:

- TriggerCallback : callback for COMP trigger.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_COMP_UnRegisterCallback to reset a callback to the default weak function.

HAL_COMP_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TriggerCallback : callback for COMP trigger.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

By default, after the HAL_COMP_Init() and when the state is HAL_COMP_STATE_RESET all callbacks are set to the corresponding weak functions: example HAL_COMP_TriggerCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_COMP_Init() / HAL_COMP_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_COMP_Init() / HAL_COMP_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_COMP_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_COMP_STATE_READY or HAL_COMP_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_COMP_RegisterCallback() before calling HAL_COMP_DeInit() or HAL_COMP_Init() function.

When the compilation flag USE_HAL_COMP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

10.2.3 Initialization and de-initialization functions

This section provides functions to initialize and de-initialize comparators

This section contains the following APIs:

- *HAL_COMP_Init()*
- *HAL_COMP_DeInit()*
- *HAL_COMP_MspInit()*
- *HAL_COMP_MspDeInit()*
- *HAL_COMP_RegisterCallback()*
- *HAL_COMP_UnRegisterCallback()*

10.2.4 IO operation functions

This section provides functions allowing to:

- Start a comparator instance.
- Stop a comparator instance.

This section contains the following APIs:

- *HAL_COMP_Start()*
- *HAL_COMP_Stop()*
- *HAL_COMP_Start_IT_OneShot()*
- *HAL_COMP_Start_IT_AutoRearm()*
- *HAL_COMP_Stop_IT()*
- *HAL_COMP_IRQHandler()*

10.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the comparators.

This section contains the following APIs:

- *HAL_COMP_Lock()*
- *HAL_COMP_GetOutputLevel()*
- *HAL_COMP_TriggerCallback()*

10.2.6 Peripheral State functions

This subsection permit to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_COMP_GetState()*
- *HAL_COMP_GetError()*

10.2.7 Detailed description of functions

HAL_COMP_Init

Function name

HAL_StatusTypeDef HAL_COMP_Init (COMP_HandleTypeDef * hcomp)

Function description

Initialize the COMP according to the specified parameters in the COMP_InitTypeDef and initialize the associated handle.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- If the selected comparator is locked, initialization can't be performed. To unlock the configuration, perform a system reset.

HAL_COMP_DeInit

Function name

HAL_StatusTypeDef HAL_COMP_DeInit (COMP_HandleTypeDef * hcomp)

Function description

DeInitialize the COMP peripheral.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- Deinitialization cannot be performed if the COMP configuration is locked. To unlock the configuration, perform a system reset.

HAL_COMP_MspInit

Function name

void HAL_COMP_MspInit (COMP_HandleTypeDef * hcomp)

Function description

Initialize the COMP MSP.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_MspDeInit

Function name

void HAL_COMP_MspDeInit (COMP_HandleTypeDef * hcomp)

Function description

DeInitialize the COMP MSP.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_COMP_RegisterCallback (COMP_HandleTypeDef * hcomp, HAL_COMP_CallbackIDTypeDef CallbackID, pCOMP_CallbackTypeDef pCallback)

Function description

Register a User COMP Callback To be used instead of the weak predefined callback.

Parameters

- **hcomp:** Pointer to a COMP_HandleTypeDef structure that contains the configuration information for the specified COMP.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_COMP_TRIGGER_CB_ID Trigger callback ID
  - HAL_COMP_MSPINIT_CB_ID MspInit callback ID
  - HAL_COMP_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_COMP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_COMP_UnRegisterCallback (COMP_HandleTypeDef * hcomp, HAL_COMP_CallbackIDTypeDef CallbackID)

Function description

Unregister a COMP Callback COMP callback is redirected to the weak predefined callback.

Parameters

- **hcomp:** Pointer to a COMP_HandleTypeDef structure that contains the configuration information for the specified COMP.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_COMP_TRIGGER_CB_ID Trigger callback ID
  - HAL_COMP_MSPINIT_CB_ID MspInit callback ID
  - HAL_COMP_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_COMP_Start

Function name

HAL_StatusTypeDef HAL_COMP_Start (COMP_HandleTypeDef * hcomp)

Function description

Start the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Stop

Function name

HAL_StatusTypeDef HAL_COMP_Stop (COMP_HandleTypeDef * hcomp)

Function description

Stop the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Start_IT_OneShot

Function name

HAL_StatusTypeDef HAL_COMP_Start_IT_OneShot (COMP_HandleTypeDef * hcomp)

Function description

Start the comparator with interruption low latency, interruption disabled at first trigger occurrence.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- Interruption low latency is achieved through direct line to NVIC (instead of going through EXTI).
- If needed, comparartor interruption can be rearmed by calling again this function.
- Specific to comparator of this STM32 series: comparator output triggers interruption on high level. This function can change output polarity depending on initial output level.

HAL_COMP_Start_IT_AutoRearm

Function name

HAL_StatusTypeDef HAL_COMP_Start_IT_AutoRearm (COMP_HandleTypeDef * hcomp)

Function description

Start the comparator with interruption low latency, interruption rearmed at each trigger occurrence.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- Interruption low latency is achieved through direct line to NVIC (instead of going through EXTI).
- If needed, comparartor interruption can be rearmed by calling again this function.
- Specific to comparator of this STM32 series: comparator output triggers interruption on high level. This function can change output polarity depending on initial output level.

HAL_COMP_Stop_IT

Function name

HAL_StatusTypeDef HAL_COMP_Stop_IT (COMP_HandleTypeDef * hcomp)

Function description

Disable the interrupt and Stop the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_IRQHandler

Function name

void HAL_COMP_IRQHandler (COMP_HandleTypeDef * hcomp)

Function description

Comparator IRQ handler.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_Lock

Function name

HAL_StatusTypeDef HAL_COMP_Lock (COMP_HandleTypeDef * hcomp)

Function description

Lock the selected comparator configuration.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- A system reset is required to unlock the comparator configuration.

HAL_COMP_GetOutputLevel

Function name

uint32_t HAL_COMP_GetOutputLevel (const COMP_HandleTypeDef * hcomp)

Function description

Return the output level (high or low) of the selected comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **Returns:** the selected comparator output level:
  - COMP_OUTPUT_LEVEL_LOW
  - COMP_OUTPUT_LEVEL_HIGH

Notes

- The output level depends on the selected polarity. If the polarity is not inverted: Comparator output is low when the input plus is at a lower voltage than the input minusComparator output is high when the input plus is at a higher voltage than the input minus If the polarity is inverted:Comparator output is high when the input plus is at a lower voltage than the input minusComparator output is low when the input plus is at a higher voltage than the input minus
- Specific to comparator of this STM32 series: comparator output triggers interruption on high level. HAL_COMP_Start_x functions can change output polarity depending on initial output level.

HAL_COMP_TriggerCallback

Function name

void HAL_COMP_TriggerCallback (COMP_HandleTypeDef * hcomp)

Function description

Comparator trigger callback.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_GetState

Function name

HAL_COMP_StateTypeDef HAL_COMP_GetState (const COMP_HandleTypeDef * hcomp)

Function description

Return the COMP handle state.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** state

HAL_COMP_GetError

Function name

uint32_t HAL_COMP_GetError (const COMP_HandleTypeDef * hcomp)

Function description

Return the COMP error code.

Parameters

- **hcomp:** COMP handle

Return values

- **COMP:** error code

10.3 COMP Firmware driver defines

The following section lists the various define and macros of the module.

10.3.1 COMP

COMP

COMP blanking source

COMP_BLANKINGSRC_NONE

Comparator output without blanking

COMP_BLANKINGSRC_TIM1_OC5

TIM1 OC5 selected as blanking source

COMP_BLANKINGSRC_TIM2_OC3

TIM2 OC3 selected as blanking source

COMP_BLANKINGSRC_TIM3_OC3

TIM3 OC3 selected as blanking source

COMP_BLANKINGSRC_TIM3_OC4

TIM3 OC4 selected as blanking source

COMP_BLANKINGSRC_LPTIM1_OC2

LPTIM1 OC2 selected as blanking source

COMP_BLANKINGSRC_LPTIM2_OC2

LPTIM2 OC2 selected as blanking source

COMP Error Code

HAL_COMP_ERROR_NONE

No error

HAL_COMP_ERROR_INVALID_CALLBACK

Invalid Callback error

COMP Exported Types

COMP_STATE_BITFIELD_LOCK

COMP EXTI Lines

COMP_EXTI_LINE_COMP1

EXTI line 29 connected to COMP1 output

COMP_EXTI_IT

EXTI line event with interruption

COMP_EXTI_RISING

EXTI line event on rising edge

COMP_EXTI_FALLING

EXTI line event on falling edge

COMP external interrupt line management

__HAL_COMP_GET_IT_SOURCE

Description:

- Checks if the specified COMP interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the COMP Handle. This parameter can be COMP1.
- __INTERRUPT__: specifies the COMP interrupt source to check. This parameter can be one of the following values:
  - COMP_IT_EN Comparator interrupt enable

Return value:

- State: of interruption (TRUE or FALSE)

__HAL_COMP_GET_FLAG

Description:

- Checks whether the specified COMP flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - COMP_FLAG_C1I Comparator 1 Interrupt Flag

Return value:

- State: of flag (TRUE or FALSE)

__HAL_COMP_CLEAR_FLAG

Description:

- Clears the specified COMP pending flag.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - COMP_CLEAR_C1IF Clear Comparator 1 Interrupt Flag

Return value:

- None

__HAL_COMP_CLEAR_C1IFLAG

Description:

- Clear the COMP C1I flag.

Return value:

- None

__HAL_COMP_ENABLE_IT

Description:

- Enable the specified COMP interrupt.

Parameters:

- __HANDLE__: specifies the COMP Handle.
- __INTERRUPT__: specifies the COMP interrupt source to enable. This parameter can be one of the following values:
  - COMP_CFGR1_ITEN Comparator interrupt

Return value:

- None

__HAL_COMP_DISABLE_IT

Description:

- Disable the specified COMP interrupt.

Parameters:

- __HANDLE__: specifies the COMP Handle.
- __INTERRUPT__: specifies the COMP interrupt source to enable. This parameter can be one of the following values:
  - COMP_CFGR1_ITEN Comparator interrupt

Return value:

- None

COMP output to EXTI

COMP_TRIGGERMODE_NONE

Comparator output triggering no External Interrupt Line

COMP_TRIGGERMODE_IT_RISING_FALLING

Comparator output triggering interrupt on rising and falling edges. Note: Specific to comparator of this STM32 series: comparator output triggers interruption on high level. HAL_COMP_Start_x functions can change output polarity depending on initial output level.

COMP Flag

COMP_FLAG_C1I

Comparator 1 Interrupt Flag

COMP_FLAG_LOCK

Lock flag

COMP private macros to get EXTI line associated with comparators

COMP_GET_EXTI_LINE

Description:

- Get the specified EXTI line for a comparator instance.

Parameters:

- __INSTANCE__: specifies the COMP instance.

Return value:

- value: of

COMP Handle Management

__HAL_COMP_RESET_HANDLE_STATE

Description:

- Reset COMP handle state.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

COMP_CLEAR_ERRORCODE

Description:

- Clear COMP error code (set it to no error code "HAL_COMP_ERROR_NONE").

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

__HAL_COMP_ENABLE

Description:

- Enable the specified comparator.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

__HAL_COMP_DISABLE

Description:

- Disable the specified comparator.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

__HAL_COMP_LOCK

Description:

- Lock the specified comparator configuration.

Parameters:

- __HANDLE__: COMP handle

Return value:

- None

Notes:

- Using this macro induce HAL COMP handle state machine being no more in line with COMP instance state. To keep HAL COMP handle state machine updated, it is recommended to use function "HAL_COMP_Lock')".

__HAL_COMP_IS_LOCKED

Description:

- Check whether the specified comparator is locked.

Parameters:

- __HANDLE__: COMP handle

Return value:

- Value: 0 if COMP instance is not locked, value 1 if COMP instance is locked

COMP hysteresis

COMP_HYSTERESIS_NONE

No hysteresis

COMP_HYSTERESIS_LOW

Hysteresis level low

COMP_HYSTERESIS_MEDIUM

Hysteresis level medium

COMP_HYSTERESIS_HIGH

Hysteresis level high

COMP input minus (inverting input)

COMP_INPUT_MINUS_1_4VREFINT

Comparator input minus connected to 1/4 VrefInt

COMP_INPUT_MINUS_1_2VREFINT

Comparator input minus connected to 1/2 VrefInt

COMP_INPUT_MINUS_3_4VREFINT

Comparator input minus connected to 3/4 VrefInt

COMP_INPUT_MINUS_VREFINT

Comparator input minus connected to VrefInt

COMP_INPUT_MINUS_DAC1_CH1

Comparator input minus connected to DAC1 channel 1

COMP_INPUT_MINUS_IO1

Comparator input minus connected to IO1 (pin PC4)

COMP_INPUT_MINUS_IO2

Comparator input minus connected to IO2 (pin PB1)

COMP_INPUT_MINUS_IO3

Comparator input minus connected to IO3 (pin PA5)

COMP_INPUT_MINUS_TEMPSENSOR

Comparator input minus connected to internal temperature sensor (also accessible through ADC peripheral)

COMP_INPUT_MINUS_VBAT

Comparator input minus connected to Vbat/4: Vbat voltage through a divider ladder of factor 1/4 to have input voltage always below Vdda.

COMP input plus (non-inverting input)

COMP_INPUT_PLUS_IO1

Comparator input plus connected to IO1 (pin PB0)

COMP_INPUT_PLUS_IO2

Comparator input plus connected to IO2 (pin PA0)

COMP_INPUT_PLUS_IO3

Comparator input plus connected to IO3 (pin PB2)

COMP_INPUT_PLUS_DAC1_CH1

Comparator input plus connected to (DAC1_CH1)

COMP Interrupts Definitions

COMP_IT_EN

COMP Interruption Clear Flags

COMP_CLEAR_C1IF

Clear Comparator 1 Interrupt Flag

COMP Output Level

COMP_OUTPUT_LEVEL_LOW

COMP_OUTPUT_LEVEL_HIGH

COMP output Polarity

COMP_OUTPUTPOL_NONINVERTED

COMP output level is not inverted (comparator output is high when the input plus is at a higher voltage than the input minus)

COMP_OUTPUTPOL_INVERTED

COMP output level is inverted (comparator output is low when the input plus is at a higher voltage than the input minus)

COMP power mode

COMP_POWERMODE_HIGHSPEED

High Speed

COMP_POWERMODE_MEDIUMSPEED

Medium Speed

COMP_POWERMODE_ULTRALOWPOWER

Ultra-low power mode

- ***uint32_t __CORDIC_HandleTypeDef::NbCalcToGet***
  Remaining number of calculation result to get
- ***uint32_t __CORDIC_HandleTypeDef::DMADirection***
  Direction of CORDIC DMA transfers
- ***DMA_HandleTypeDef* __CORDIC_HandleTypeDef::hdmaIn***
  CORDIC peripheral input data DMA handle parameters
- ***DMA_HandleTypeDef* __CORDIC_HandleTypeDef::hdmaOut***
  CORDIC peripheral output data DMA handle parameters
- ***HAL_LockTypeDef __CORDIC_HandleTypeDef::Lock***
  CORDIC locking object
- ***__IO HAL_CORDIC_StateTypeDef __CORDIC_HandleTypeDef::State***
  CORDIC state
- ***__IO uint32_t __CORDIC_HandleTypeDef::ErrorCode***
  CORDIC peripheral error code This parameter can be a value of ***CORDIC_Error_Code***
- ***void(* __CORDIC_HandleTypeDef::ErrorCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC error callback
- ***void(* __CORDIC_HandleTypeDef::CalculateCpltCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC calculate complete callback

- ***void(* __CORDIC_HandleTypeDef::MspInitCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC Msp Init callback
- ***void(* __CORDIC_HandleTypeDef::MspDeInitCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC Msp DeInit callback

11.1.2 CORDIC_ConfigTypeDef

CORDIC_ConfigTypeDef is defined in the stm32h5xx_hal_cordic.h

Data Fields

- ***uint32_t Function***
- ***uint32_t Scale***
- ***uint32_t InSize***
- ***uint32_t OutSize***
- ***uint32_t NbWrite***
- ***uint32_t NbRead***
- ***uint32_t Precision***

Field Documentation

- ***uint32_t CORDIC_ConfigTypeDef::Function***
  Function This parameter can be a value of ***CORDIC_Function***
- ***uint32_t CORDIC_ConfigTypeDef::Scale***
  Scaling factor This parameter can be a value of ***CORDIC_Scale***
- ***uint32_t CORDIC_ConfigTypeDef::InSize***
  Width of input data This parameter can be a value of ***CORDIC_In_Size***
- ***uint32_t CORDIC_ConfigTypeDef::OutSize***
  Width of output data This parameter can be a value of ***CORDIC_Out_Size***
- ***uint32_t CORDIC_ConfigTypeDef::NbWrite***
  Number of 32-bit write expected for one calculation This parameter can be a value of ***CORDIC_Nb_Write***
- ***uint32_t CORDIC_ConfigTypeDef::NbRead***
  Number of 32-bit read expected after one calculation This parameter can be a value of ***CORDIC_Nb_Read***
- ***uint32_t CORDIC_ConfigTypeDef::Precision***
  Number of cycles for calculation This parameter can be a value of ***CORDIC_Precision_In_Cycles_Number***

11.2 CORDIC Firmware driver API description

The following section lists the various functions of the CORDIC library.

11.2.1 How to use this driver

The CORDIC HAL driver can be used as follows:

1. Initialize the CORDIC low level resources by implementing the HAL_CORDIC_MspInit():
   - Enable the CORDIC interface clock using __HAL_RCC_CORDIC_CLK_ENABLE()
   - In case of using interrupts (e.g. HAL_CORDIC_Calculate_IT())
     - Configure the CORDIC interrupt priority using HAL_NVIC_SetPriority()
     - Enable the CORDIC IRQ handler using HAL_NVIC_EnableIRQ()
     - In CORDIC IRQ handler, call HAL_CORDIC_IRQHandler()
   - In case of using DMA to control data transfer (e.g. HAL_CORDIC_Calculate_DMA())
     - Enable the DMA2 interface clock using __HAL_RCC_DMA2_CLK_ENABLE()
     - Configure and enable two DMA channels one for managing data transfer from memory to peripheral (input channel) and another channel for managing data transfer from peripheral to memory (output channel)
     - Associate the initialized DMA handle to the CORDIC DMA handle using __HAL_LINKDMA()
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the two DMA channels. Resort to HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()

2. Initialize the CORDIC HAL using HAL_CORDIC_Init(). This function
   – resorts to HAL_CORDIC_MspInit() for low-level initialization,
3. Configure CORDIC processing (calculation) using HAL_CORDIC_Configure(). This function configures:
   – Processing functions: Cosine, Sine, Phase, Modulus, Arctangent, Hyperbolic cosine, Hyperbolic sine, Hyperbolic arctangent, Natural log, Square root
   – Scaling factor: 1 to 2exp(-7)
   – Width of input data: 32 bits input data size (Q1.31 format) or 16 bits input data size (Q1.15 format)
   – Width of output data: 32 bits output data size (Q1.31 format) or 16 bits output data size (Q1.15 format)
   – Number of 32-bit write expected for one calculation: One 32-bits write or Two 32-bit write
   – Number of 32-bit read expected after one calculation: One 32-bits read or Two 32-bit read
   – Precision: 1 to 15 cycles for calculation (the more cycles, the better precision)
4. Four processing (calculation) functions are available:
   – Polling mode: processing API is blocking function i.e. it processes the data and wait till the processing is finished API is HAL_CORDIC_Calculate
   – Polling Zero-overhead mode: processing API is blocking function i.e. it processes the data and wait till the processing is finished A bit faster than standard polling mode, but blocking also AHB bus API is HAL_CORDIC_CalculateZO
   – Interrupt mode: processing API is not blocking functions i.e. it processes the data under interrupt API is HAL_CORDIC_Calculate_IT
   – DMA mode: processing API is not blocking functions and the CPU is not used for data transfer, i.e. the data transfer is ensured by DMA API is HAL_CORDIC_Calculate_DMA
5. Call HAL_CORDIC_DeInit() to de-initialize the CORDIC peripheral. This function
   – resorts to HAL_CORDIC_MspDeInit() for low-level de-initialization,

Callback registration

11.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the CORDIC peripheral and the associated handle
- DeInitialize the CORDIC peripheral
- Initialize the CORDIC MSP (MCU Specific Package)
- De-Initialize the CORDIC MSP

This section contains the following APIs:

- ***HAL_CORDIC_Init()***
- ***HAL_CORDIC_DeInit()***
- ***HAL_CORDIC_MspInit()***
- ***HAL_CORDIC_MspDeInit()***
- ***HAL_CORDIC_RegisterCallback()***
- ***HAL_CORDIC_UnRegisterCallback()***
- ***HAL_CORDIC_RegisterCallback()***

11.2.3 Peripheral Control functions

This section provides functions allowing to:

- Configure the CORDIC peripheral: function, precision, scaling factor, number of input data and output data, size of input data and output data.
- Calculate output data of CORDIC processing on input date, using the existing CORDIC configuration

Four processing functions are available for calculation:

- Polling mode
- Polling mode, with Zero-Overhead register access
- Interrupt mode
- DMA mode

This section contains the following APIs:

- *HAL_CORDIC_Configure()*
- *HAL_CORDIC_Calculate()*
- *HAL_CORDIC_CalculateZO()*
- *HAL_CORDIC_Calculate_IT()*
- *HAL_CORDIC_Calculate_DMA()*

11.2.4 Callback functions

This section provides Interruption and DMA callback functions:

- DMA or Interrupt calculate complete
- DMA or Interrupt error

This section contains the following APIs:

- *HAL_CORDIC_ErrorCallback()*
- *HAL_CORDIC_CalculateCpltCallback()*

11.2.5 IRQ handler management

This section provides IRQ handler function.

This section contains the following APIs:

- *HAL_CORDIC_IRQHandler()*

11.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_CORDIC_GetState()*
- *HAL_CORDIC_GetError()*

11.2.7 Detailed description of functions

HAL_CORDIC_Init

Function name

HAL_StatusTypeDef HAL_CORDIC_Init (CORDIC_HandleTypeDef * hcordic)

Function description

Initialize the CORDIC peripheral and the associated handle.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure.

Return values

- **HAL:** status

HAL_CORDIC_DeInit

Function name

HAL_StatusTypeDef HAL_CORDIC_DeInit (CORDIC_HandleTypeDef * hcordic)

Function description

DeInitialize the CORDIC peripheral.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure.

Return values

- **HAL:** status

HAL_CORDIC_MspInit

Function name

void HAL_CORDIC_MspInit (CORDIC_HandleTypeDef * hcordic)

Function description

Initialize the CORDIC MSP.

Parameters

- **hcordic:** CORDIC handle

Return values

- **None:**

HAL_CORDIC_MspDeInit

Function name

void HAL_CORDIC_MspDeInit (CORDIC_HandleTypeDef * hcordic)

Function description

DeInitialize the CORDIC MSP.

Parameters

- **hcordic:** CORDIC handle

Return values

- **None:**

HAL_CORDIC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CORDIC_RegisterCallback (CORDIC_HandleTypeDef * hcordic, HAL_CORDIC_CallbackIDTypeDef CallbackID, pCORDIC_CallbackTypeDef pCallback)

Function description

HAL_CORDIC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CORDIC_UnRegisterCallback (CORDIC_HandleTypeDef * hcordic, HAL_CORDIC_CallbackIDTypeDef CallbackID)

Function description

Unregister a CORDIC CallBack.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CORDIC_ERROR_CB_ID error Callback ID
  - HAL_CORDIC_CALCULATE_CPLT_CB_ID calculate complete Callback ID
  - HAL_CORDIC_MSPINIT_CB_ID MspInit callback ID
  - HAL_CORDIC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_CORDIC_Configure

Function name

HAL_StatusTypeDef HAL_CORDIC_Configure (CORDIC_HandleTypeDef * hcordic, const CORDIC_ConfigTypeDef * sConfig)

Function description

Configure the CORDIC processing according to the specified parameters in the CORDIC_ConfigTypeDef structure.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module
- **sConfig:** pointer to a CORDIC_ConfigTypeDef structure that contains the CORDIC configuration information.

Return values

- **HAL:** status

HAL_CORDIC_Calculate

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t Timeout)

Function description

Carry out data of CORDIC processing in polling mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CORDIC_CalculateZO

Function name

HAL_StatusTypeDef HAL_CORDIC_CalculateZO (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t Timeout)

Function description

Carry out data of CORDIC processing in Zero-Overhead mode (output data being read soon as input data are written), according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CORDIC_Calculate_IT

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate_IT (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc)

Function description

Carry out data of CORDIC processing in interrupt mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.

Return values

- **HAL:** status

HAL_CORDIC_Calculate_DMA

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate_DMA (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t DMADirection)

Function description

Carry out input and/or output data of CORDIC processing in DMA mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **DMADirection:** Direction of DMA transfers. This parameter can be one of the following values:
  - CORDIC DMA direction CORDIC DMA direction

Return values

- **HAL:** status

Notes

- pInBuff or pOutBuff is unused in case of unique DMADirection transfer, and can be set to NULL value in this case.
- pInBuff and pOutBuff buffers must be 32-bit aligned to ensure a correct DMA transfer to and from the Peripheral.

HAL_CORDIC_ErrorCallback

Function name

void HAL_CORDIC_ErrorCallback (CORDIC_HandleTypeDef * hcordic)

Function description

CORDIC error callback.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_CalculateCpltCallback

Function name

void HAL_CORDIC_CalculateCpltCallback (CORDIC_HandleTypeDef * hcordic)

Function description

CORDIC calculate complete callback.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_IRQHandler

Function name

void HAL_CORDIC_IRQHandler (CORDIC_HandleTypeDef * hcordic)

Function description

Handle CORDIC interrupt request.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_GetState

Function name

HAL_CORDIC_StateTypeDef HAL_CORDIC_GetState (const CORDIC_HandleTypeDef * hcordic)

Function description

Return the CORDIC handle state.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **HAL:** state

HAL_CORDIC_GetError

Function name

uint32_t HAL_CORDIC_GetError (const CORDIC_HandleTypeDef * hcordic)

Function description

Return the CORDIC peripheral error.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **Error:** bit-map

Notes

- The returned error is a bit-map combination of possible errors

11.3 CORDIC Firmware driver defines

The following section lists the various define and macros of the module.

11.3.1 CORDIC

CORDIC

DMA Read Request Enable bit

CORDIC_DMA_REN

DMA Read requests enable

DMA Write Request Enable bit

CORDIC_DMA_WEN

DMA Write channel enable

CORDIC DMA direction

CORDIC_DMA_DIR_NONE

DMA direction : none

CORDIC_DMA_DIR_IN

DMA direction : Input of CORDIC

CORDIC_DMA_DIR_OUT

DMA direction : Output of CORDIC

CORDIC_DMA_DIR_IN_OUT

DMA direction : Input and Output of CORDIC

CORDIC Error code

HAL_CORDIC_ERROR_NONE

No error

HAL_CORDIC_ERROR_PARAM

Wrong parameter error

HAL_CORDIC_ERROR_NOT_READY

Peripheral not ready

HAL_CORDIC_ERROR_TIMEOUT

Timeout error

HAL_CORDIC_ERROR_DMA

DMA error

HAL_CORDIC_ERROR_INVALID_CALLBACK

Invalid Callback error

CORDIC Exported Macros

__HAL_CORDIC_RESET_HANDLE_STATE

Description:

- Reset CORDIC handle state.

Parameters:

- __HANDLE__: CORDIC handle

Return value:

- None

__HAL_CORDIC_ENABLE_IT

Description:

- Enable the CORDIC interrupt when result is ready.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC Interrupt. This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- None

__HAL_CORDIC_DISABLE_IT

Description:

- Disable the CORDIC interrupt.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC Interrupt. This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- None

__HAL_CORDIC_GET_IT

Description:

- Check whether the specified CORDIC interrupt occurred or not.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to check

Return value:

- SET: (interrupt occurred) or RESET (interrupt did not occurred)

__HAL_CORDIC_CLEAR_IT

Description:

- Clear specified CORDIC interrupt status.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to clear

Return value:

- None

__HAL_CORDIC_GET_FLAG

Description:

- Check whether the specified CORDIC status flag is set or not.

Parameters:

- __HANDLE__: CORDIC handle.
- __FLAG__: CORDIC flag to check This parameter can be one of the following values:
  - CORDIC_FLAG_RRDY Result Ready Flag

Return value:

- SET: (flag is set) or RESET (flag is reset)

__HAL_CORDIC_CLEAR_FLAG

Description:

- Clear specified CORDIC status flag.

Parameters:

- __HANDLE__: CORDIC handle.
- __FLAG__: CORDIC flag to clear This parameter can be one of the following values:
  - CORDIC_FLAG_RRDY Result Ready Flag

Return value:

- None

__HAL_CORDIC_GET_IT_SOURCE

Description:

- Check whether the specified CORDIC interrupt is enabled or not.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to check This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- FlagStatus

CORDIC status flags

CORDIC_FLAG_RRDY

Result Ready Flag

CORDIC Function

CORDIC_FUNCTION_COSINE

Cosine

CORDIC_FUNCTION_SINE

Sine

CORDIC_FUNCTION_PHASE

Phase

CORDIC_FUNCTION_MODULUS

Modulus

CORDIC_FUNCTION_ARCTANGENT

Arctangent

CORDIC_FUNCTION_HCOSINE

Hyperbolic Cosine

CORDIC_FUNCTION_HSINE

Hyperbolic Sine

CORDIC_FUNCTION_HARCTANGENT

Hyperbolic Arctangent

CORDIC_FUNCTION_NATURALLOG

Natural Logarithm

CORDIC_FUNCTION_SQUAREROOT

Square Root

CORDIC Interrupts Enable bit

CORDIC_IT_IEN

Result ready interrupt enable

CORDIC input data size

CORDIC_INSIZE_32BITS

32 bits input data size (Q1.31 format)

CORDIC_INSIZE_16BITS

16 bits input data size (Q1.15 format)

CORDIC Number of 32-bit read required after one calculation

CORDIC_NBREAD_1

One 32-bits read containing either only one 32-bit data output (Q1.31 format), or two 16-bit data output (Q1.15 format) packed in one 32 bits Data

CORDIC_NBREAD_2

Two 32-bit Data containing two 32-bits data output (Q1.31 format)

CORDIC Number of 32-bit write required for one calculation

CORDIC_NBWRITE_1

One 32-bits write containing either only one 32-bit data input (Q1.31 format), or two 16-bit data input (Q1.15 format) packed in one 32 bits Data

CORDIC_NBWRITE_2

Two 32-bit write containing two 32-bits data input (Q1.31 format)

CORDIC Results Size

CORDIC_OUTSIZE_32BITS

32 bits output data size (Q1.31 format)

CORDIC_OUTSIZE_16BITS

16 bits output data size (Q1.15 format)

12 HAL CORTEX Generic Driver

12.1 CORTEX Firmware driver registers structures

12.1.1 MPU_Region_InitTypeDef

MPU_Region_InitTypeDef is defined in the stm32h5xx_hal_cortex.h

Data Fields

- ***uint8_t Enable***
- ***uint8_t Number***
- ***uint32_t BaseAddress***
- ***uint32_t LimitAddress***
- ***uint8_t AttributesIndex***
- ***uint8_t AccessPermission***
- ***uint8_t DisableExec***
- ***uint8_t IsShareable***

Field Documentation

- ***uint8_t MPU_Region_InitTypeDef::Enable***
  Specifies the status of the region. This parameter can be a value of ***CORTEX_MPU_Region_Enable***
- ***uint8_t MPU_Region_InitTypeDef::Number***
  Specifies the index of the region to protect. This parameter can be a value of ***CORTEX_MPU_Region_Number***
- ***uint32_t MPU_Region_InitTypeDef::BaseAddress***
  Specifies the base address of the region to protect.
- ***uint32_t MPU_Region_InitTypeDef::LimitAddress***
  Specifies the limit address of the region to protect.
- ***uint8_t MPU_Region_InitTypeDef::AttributesIndex***
  Specifies the memory attributes index. This parameter can be a value of ***CORTEX_MPU_Attributes_Number***
- ***uint8_t MPU_Region_InitTypeDef::AccessPermission***
  Specifies the region access permission type. This parameter can be a value of ***CORTEX_MPU_Region_Permission_Attributes***
- ***uint8_t MPU_Region_InitTypeDef::DisableExec***
  Specifies the instruction access status. This parameter can be a value of ***CORTEX_MPU_Instruction_Access***
- ***uint8_t MPU_Region_InitTypeDef::IsShareable***
  Specifies the shareability status of the protected region. This parameter can be a value of ***CORTEX_MPU_Access_Shareable***

12.1.2 MPU_Attributes_InitTypeDef

MPU_Attributes_InitTypeDef is defined in the stm32h5xx_hal_cortex.h

Data Fields

- ***uint8_t Number***
- ***uint8_t Attributes***

Field Documentation

- ***uint8_t MPU_Attributes_InitTypeDef::Number***
  Specifies the number of the memory attributes to configure. This parameter can be a value of ***CORTEX_MPU_Attributes_Number***
- ***uint8_t MPU_Attributes_InitTypeDef::Attributes***
  Specifies the memory attributes value. Attributes This parameter can be a combination of ***CORTEX_MPU_Attributes***

12.2 CORTEX Firmware driver API description

The following section lists the various functions of the CORTEX library.

12.2.1 How to use this driver

How to configure Interrupts using CORTEX HAL driver

This section provides functions allowing to configure the NVIC interrupts (IRQ). The Cortex-M33 exceptions are managed by CMSIS functions.

1. Configure the NVIC Priority Grouping using HAL_NVIC_SetPriorityGrouping() function.
2. Configure the priority of the selected IRQ Channels using HAL_NVIC_SetPriority().
3. Enable the selected IRQ Channels using HAL_NVIC_EnableIRQ().

Note: When the NVIC_PRIORITYGROUP_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the sub priority.

Note: IRQ priority order (sorted by highest to lowest priority):

- *Lowest pre-emption priority*
- *Lowest sub priority*
- *Lowest hardware priority (IRQ number)*

How to configure SysTick using CORTEX HAL driver

Setup SysTick Timer for time base.

- The HAL_SYSTICK_Config() function calls the SysTick_Config() function which is a CMSIS function that:
  - Configures the SysTick Reload register with value passed as function parameter.
  - Configures the SysTick IRQ priority to the lowest value (0x0F).
  - Resets the SysTick Counter register.
  - Configures the SysTick Counter clock source to be Core Clock Source (HCLK).
  - Enables the SysTick Interrupt.
  - Starts the SysTick Counter.
- You can change the SysTick Clock source to be HCLK_Div8 by calling the macro __HAL_CORTEX_SYSTICKCLK_CONFIG(SYSTICK_CLKSOURCE_HCLK_DIV8) just after the HAL_SYSTICK_Config() function call. The __HAL_CORTEX_SYSTICKCLK_CONFIG() macro is defined inside the stm32h5xx_hal_cortex.h file.
- You can change the SysTick IRQ priority by calling the HAL_NVIC_SetPriority(SysTick_IRQn,...) function just after the HAL_SYSTICK_Config() function call. The HAL_NVIC_SetPriority() call the NVIC_SetPriority() function which is a CMSIS function.
- To adjust the SysTick time base, use the following formula: Reload Value = SysTick Counter Clock (Hz) x Desired Time base (s)
  - Reload Value is the parameter to be passed for HAL_SYSTICK_Config() function
  - Reload Value should not exceed 0xFFFFFF

How to configure MPU (secure and non secure) using CORTEX HAL driver

This section provides functions allowing to Enable and configure the MPU secure and non-secure.

1. Enable the MPU using HAL_MPU_Enable() function.
2. Disable the MPU using HAL_MPU_Disable() function.
3. Enable the MPU using HAL_MPU_Enable_NS() function to address the non secure MPU.
4. Disable the MPU using HAL_MPU_Disable_NS() function to address the non secure MPU.
5. Configure the MPU region using HAL_MPU_ConfigRegion() and HAL_MPU_ConfigRegion_NS() to address the non secure MPU.
6. Configure the MPU Memory attributes using HAL_MPU_ConfigMemoryAttributes() and HAL_MPU_ConfigMemoryAttributes_NS() to address the non secure MPU.

12.2.2 NVIC functions

This section provides the CORTEX HAL driver functions for NVIC functionalities

This section contains the following APIs:

- *HAL_NVIC_SetPriorityGrouping()*
- *HAL_NVIC_SetPriority()*
- *HAL_NVIC_EnableIRQ()*
- *HAL_NVIC_DisableIRQ()*
- *HAL_NVIC_SystemReset()*
- *HAL_NVIC_GetPriorityGrouping()*
- *HAL_NVIC_GetPriority()*
- *HAL_NVIC_SetPendingIRQ()*
- *HAL_NVIC_GetPendingIRQ()*
- *HAL_NVIC_ClearPendingIRQ()*
- *HAL_NVIC_GetActive()*

12.2.3 SYSTICK functions

This section provides the CORTEX HAL driver functions for SYSTICK functionalities

This section contains the following APIs:

- *HAL_SYSTICK_Config()*
- *HAL_SYSTICK_CLKSourceConfig()*
- *HAL_SYSTICK_IRQHandler()*
- *HAL_SYSTICK_Callback()*

12.2.4 MPU functions

This section provides the CORTEX HAL driver functions for MPU functionalities

This section contains the following APIs:

- *HAL_MPU_Enable()*
- *HAL_MPU_Enable_NS()*
- *HAL_MPU_Disable()*
- *HAL_MPU_Disable_NS()*
- *HAL_MPU_ConfigRegion()*
- *HAL_MPU_ConfigRegion_NS()*
- *HAL_MPU_ConfigMemoryAttributes()*
- *HAL_MPU_ConfigMemoryAttributes_NS()*

12.2.5 Detailed description of functions

HAL_NVIC_SetPriorityGrouping

Function name

void HAL_NVIC_SetPriorityGrouping (uint32_t PriorityGroup)

Function description

Set the priority grouping field (pre-emption priority and subpriority) using the required unlock sequence.

Parameters

- **PriorityGroup:** The priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0: 0 bit for pre-emption priority, 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1: 1 bit for pre-emption priority, 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2: 2 bits for pre-emption priority, 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3: 3 bits for pre-emption priority, 1 bit for subpriority
  - NVIC_PRIORITYGROUP_4: 4 bits for pre-emption priority, 0 bit for subpriority

Return values

- **None:**

Notes

- When the NVIC_PRIORITYGROUP_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the subpriority.

HAL_NVIC_SetPriority

Function name

void HAL_NVIC_SetPriority (IRQn_Type IRQn, uint32_t PreemptPriority, uint32_t SubPriority)

Function description

Set the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))
- **PreemptPriority:** The pre-emption priority for the IRQn channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority
- **SubPriority:** the subpriority level for the IRQ channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority.

Return values

- **None:**

HAL_NVIC_EnableIRQ

Function name

void HAL_NVIC_EnableIRQ (IRQn_Type IRQn)

Function description

Enable a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))

Return values

- **None:**

Notes

- To configure interrupts priority correctly, the NVIC_PriorityGroupConfig() function should be called before.

HAL_NVIC_DisableIRQ

Function name

void HAL_NVIC_DisableIRQ (IRQn_Type IRQn)

Function description

Disable a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))

Return values

- **None:**

HAL_NVIC_SystemReset

Function name

void HAL_NVIC_SystemReset (void)

Function description

Initiate a system reset request to reset the MCU.

Return values

- **None:**

HAL_NVIC_GetPriorityGrouping

Function name

uint32_t HAL_NVIC_GetPriorityGrouping (void)

Function description

Get the priority grouping field from the NVIC Interrupt Controller.

Return values

- **Priority:** grouping field (SCB->AIRCR [10:8] PRIGROUP field)

HAL_NVIC_GetPriority

Function name

void HAL_NVIC_GetPriority (IRQn_Type IRQn, uint32_t PriorityGroup, uint32_t *const pPreemptPriority, uint32_t *const pSubPriority)

Function description

Get the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))
- **PriorityGroup:** the priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0: 0 bit for pre-emption priority, 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1: 1 bit for pre-emption priority, 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2: 2 bits for pre-emption priority, 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3: 3 bits for pre-emption priority, 1 bit for subpriority
  - NVIC_PRIORITYGROUP_4: 4 bits for pre-emption priority, 0 bit for subpriority
- **pPreemptPriority:** Pointer on the Preemptive priority value (starting from 0).
- **pSubPriority:** Pointer on the Subpriority value (starting from 0).

Return values

- **None:**

HAL_NVIC_GetPendingIRQ

Function name

uint32_t HAL_NVIC_GetPendingIRQ (IRQn_Type IRQn)

Function description

Get Pending Interrupt (read the pending register in the NVIC and return the pending bit for the specified interrupt).

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_NVIC_SetPendingIRQ

Function name

void HAL_NVIC_SetPendingIRQ (IRQn_Type IRQn)

Function description

Set Pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))

Return values

- **None:**

HAL_NVIC_ClearPendingIRQ

Function name

void HAL_NVIC_ClearPendingIRQ (IRQn_Type IRQn)

Function description

Clear the pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))

Return values

- **None:**

HAL_NVIC_GetActive

Function name

uint32_t HAL_NVIC_GetActive (IRQn_Type IRQn)

Function description

Get active interrupt (read the active register in NVIC and return the active bit).

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32h5xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_SYSTICK_Config

Function name

uint32_t HAL_SYSTICK_Config (uint32_t TicksNumb)

Function description

Initialize the System Timer with interrupt enabled and start the System Tick Timer (SysTick): Counter is in free running mode to generate periodic interrupts.

Parameters

- **TicksNumb:** Specifies the ticks Number of ticks between two interrupts.

Return values

- **status:** - 0 Function succeeded.
  - 1 Function failed.

HAL_SYSTICK_CLKSourceConfig

Function name

void HAL_SYSTICK_CLKSourceConfig (uint32_t CLKSource)

Function description

Configure the SysTick clock source.

Parameters

- **CLKSource:** specifies the SysTick clock source. This parameter can be one of the following values:
  - SYSTICK_CLKSOURCE_LSI: LSI clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_LSE: LSE clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_HCLK: AHB clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_HCLK_DIV8: AHB clock divided by 8 selected as SysTick clock source.

Return values

- **None:**

HAL_SYSTICK_IRQHandler

Function name

void HAL_SYSTICK_IRQHandler (void)

Function description

Handle SYSTICK interrupt request.

Return values

- **None:**

HAL_SYSTICK_Callback

Function name

void HAL_SYSTICK_Callback (void)

Function description

SYSTICK callback.

Return values

- **None:**

HAL_MPU_Enable

Function name

void HAL_MPU_Enable (uint32_t MPU_Control)

Function description

Enable the MPU.

Parameters

- **MPU_Control:** Specifies the control mode of the MPU during hard fault, NMI, FAULTMASK and privileged access to the default memory This parameter can be one of the following values:
  - MPU_HFNMI_PRIVDEF_NONE
  - MPU_HARDFAULT_NMI
  - MPU_PRIVILEGED_DEFAULT
  - MPU_HFNMI_PRIVDEF

Return values

- **None:**

HAL_MPU_Disable

Function name

void HAL_MPU_Disable (void)

Function description

Disable the MPU.

Return values

- **None:**

HAL_MPU_ConfigRegion

Function name

void HAL_MPU_ConfigRegion (const MPU_Region_InitTypeDef *const pMPU_RegionInit)

Function description

Initialize and configure the Region and the memory to be protected.

Parameters

- **pMPU_RegionInit:** Pointer to a MPU_Region_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_ConfigMemoryAttributes

Function name

void HAL_MPU_ConfigMemoryAttributes (const MPU_Attributes_InitTypeDef *const pMPU_AttributesInit)

Function description

Initialize and configure the memory attributes.

Parameters

- **pMPU_AttributesInit:** Pointer to a MPU_Attributes_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_Enable_NS

Function name

void HAL_MPU_Enable_NS (uint32_t MPU_Control)

Function description

Enable the non-secure MPU.

Parameters

- **MPU_Control:** Specifies the control mode of the MPU during hard fault, NMI, FAULTMASK and privileged access to the default memory This parameter can be one of the following values:
  - MPU_HFNMI_PRIVDEF_NONE
  - MPU_HARDFAULT_NMI
  - MPU_PRIVILEGED_DEFAULT
  - MPU_HFNMI_PRIVDEF

Return values

- **None:**

HAL_MPU_Disable_NS

Function name

void HAL_MPU_Disable_NS (void)

Function description

Disable the non-secure MPU.

Return values

- **None:**

HAL_MPU_ConfigRegion_NS

Function name

void HAL_MPU_ConfigRegion_NS (const MPU_Region_InitTypeDef *const pMPU_RegionInit)

Function description

Initialize and configure the Region and the memory to be protected for non-secure MPU.

Parameters

- **pMPU_RegionInit:** Pointer to a MPU_Region_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_ConfigMemoryAttributes_NS

Function name

void HAL_MPU_ConfigMemoryAttributes_NS (const MPU_Attributes_InitTypeDef *const pMPU_AttributesInit)

Function description

Initialize and configure the memory attributes for non-secure MPU.

Parameters

- **pMPU_AttributesInit:** Pointer to a MPU_Attributes_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

12.3 CORTEX Firmware driver defines

The following section lists the various define and macros of the module.

12.3.1 CORTEX

CORTEX

CORTEX Exported Macros

OUTER

INNER_OUTER

CORTEX MPU Instruction Access Shareable

MPU_ACCESS_NOT_SHAREABLE

MPU region not shareable

MPU_ACCESS_OUTER_SHAREABLE

MPU region outer shareable

MPU_ACCESS_INNER_SHAREABLE

MPU region inner shareable

CORTEX MPU Attributes

MPU_DEVICE_nGnRnE

Device, noGather, noReorder, noEarly acknowledge.

MPU_DEVICE_nGnRE

Device, noGather, noReorder, Early acknowledge.

MPU_DEVICE_nGRE

Device, noGather, Reorder, Early acknowledge.

MPU_DEVICE_GRE

Device, Gather, Reorder, Early acknowledge.

MPU_WRITE_THROUGH

Normal memory, write-through.

MPU_NOT_CACHEABLE

Normal memory, non-cacheable.

MPU_WRITE_BACK

Normal memory, write-back.

MPU_TRANSIENT

Normal memory, transient.

MPU_NON_TRANSIENT

Normal memory, non-transient.

MPU_NO_ALLOCATE

Normal memory, no allocate.

MPU_W_ALLOCATE

Normal memory, write allocate.

MPU_R_ALLOCATE

Normal memory, read allocate.

MPU_RW_ALLOCATE

Normal memory, read/write allocate.

CORTEX MPU Memory Attributes Number

MPU_ATTRIBUTES_NUMBER0

MPU attribute number 0

MPU_ATTRIBUTES_NUMBER1

MPU attribute number 1

MPU_ATTRIBUTES_NUMBER2

MPU attribute number 2

MPU_ATTRIBUTES_NUMBER3

MPU attribute number 3

MPU_ATTRIBUTES_NUMBER4

MPU attribute number 4

MPU_ATTRIBUTES_NUMBER5

MPU attribute number 5

MPU_ATTRIBUTES_NUMBER6

MPU attribute number 6

MPU_ATTRIBUTES_NUMBER7

MPU attribute number 7

CORTEX MPU HFNMI and PRIVILEGED Access control

MPU_HFNMI_PRIVDEF_NONE

MPU is disabled during HardFault and NMI handlers, privileged software access to the default memory map is disabled

MPU_HARDFAULT_NMI

MPU is enabled during HardFault and NMI handlers, privileged software access to the default memory map is disabled

MPU_PRIVILEGED_DEFAULT

MPU is disabled during HardFault and NMI handlers, privileged software access to the default memory map is enabled

MPU_HFNMI_PRIVDEF

MPU is enabled during HardFault and NMI handlers, privileged software access to the default memory map is enabled

CORTEX MPU Instruction Access

MPU_INSTRUCTION_ACCESS_ENABLE

MPU region execution permitted (if read permitted)

MPU_INSTRUCTION_ACCESS_DISABLE

MPU region execution not permitted

CORTEX MPU Region Enable

MPU_REGION_ENABLE

MPU region enabled

MPU_REGION_DISABLE

MPU region disabled

CORTEX MPU Region Number

MPU_REGION_NUMBER0

MPU region number 0

MPU_REGION_NUMBER1

MPU region number 1

MPU_REGION_NUMBER2

MPU region number 2

MPU_REGION_NUMBER3

MPU region number 3

MPU_REGION_NUMBER4

MPU region number 4

MPU_REGION_NUMBER8

MPU region number 8

MPU_REGION_NUMBER9

MPU region number 9

MPU_REGION_NUMBER10

MPU region number 10

MPU_REGION_NUMBER11

MPU region number 11

CORTEX MPU Region Permission Attributes

MPU_REGION_PRIV_RW

MPU region Read/write by privileged code only

MPU_REGION_ALL_RW

MPU region Read/write by any privilege level

MPU_REGION_PRIV_RO

MPU region Read-only by privileged code only

MPU_REGION_ALL_RO

MPU region Read-only by any privilege level

CORTEX Preemption Priority Group

NVIC_PRIORITYGROUP_0

0 bit for pre-emption priority, 4 bits for subpriority

NVIC_PRIORITYGROUP_1

1 bit for pre-emption priority, 3 bits for subpriority

NVIC_PRIORITYGROUP_2

2 bits for pre-emption priority, 2 bits for subpriority

NVIC_PRIORITYGROUP_3

3 bits for pre-emption priority, 1 bit for subpriority

NVIC_PRIORITYGROUP_4

4 bits for pre-emption priority, 0 bit for subpriority

CORTEX SysTick clock source

SYSTICK_CLKSOURCE_HCLK_DIV8

AHB clock divided by 8 selected as SysTick clock source

SYSTICK_CLKSOURCE_LSI

LSI clock selected as SysTick clock source

SYSTICK_CLKSOURCE_LSE

LSE clock selected as SysTick clock source

SYSTICK_CLKSOURCE_HCLK

AHB clock selected as SysTick clock source

13 HAL CRC Generic Driver

13.1 CRC Firmware driver registers structures

13.1.1 CRC_InitTypeDef

CRC_InitTypeDef is defined in the stm32h5xx_hal_crc.h

Data Fields

- ***uint8_t DefaultPolynomialUse***
- ***uint8_t DefaultInitValueUse***
- ***uint32_t GeneratingPolynomial***
- ***uint32_t CRCLength***
- ***uint32_t InitValue***
- ***uint32_t InputDataInversionMode***
- ***uint32_t OutputDataInversionMode***

Field Documentation

- ***uint8_t CRC_InitTypeDef::DefaultPolynomialUse***
  This parameter is a value of ***CRC_Default_Polynomial*** and indicates if default polynomial is used. If set to DEFAULT_POLYNOMIAL_ENABLE, resort to default X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1. In that case, there is no need to set GeneratingPolynomial field. If otherwise set to DEFAULT_POLYNOMIAL_DISABLE, GeneratingPolynomial and CRCLength fields must be set.
- ***uint8_t CRC_InitTypeDef::DefaultInitValueUse***
  This parameter is a value of ***CRC_Default_InitValue_Use*** and indicates if default init value is used. If set to DEFAULT_INIT_VALUE_ENABLE, resort to default 0xFFFFFFFF value. In that case, there is no need to set InitValue field. If otherwise set to DEFAULT_INIT_VALUE_DISABLE, InitValue field must be set.
- ***uint32_t CRC_InitTypeDef::GeneratingPolynomial***
  Set CRC generating polynomial as a 7, 8, 16 or 32-bit long value for a polynomial degree respectively equal to 7, 8, 16 or 32. This field is written in normal, representation e.g., for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65. No need to specify it if DefaultPolynomialUse is set to DEFAULT_POLYNOMIAL_ENABLE.
- ***uint32_t CRC_InitTypeDef::CRCLength***
  This parameter is a value of ***CRC_Polynomial_Sizes*** and indicates CRC length. Value can be either one of
  - **CRC_POLYLENGTH_32B** (32-bit CRC),
  - **CRC_POLYLENGTH_16B** (16-bit CRC),
  - **CRC_POLYLENGTH_8B** (8-bit CRC),
  - **CRC_POLYLENGTH_7B** (7-bit CRC).
- ***uint32_t CRC_InitTypeDef::InitValue***
  Init value to initiate CRC computation. No need to specify it if DefaultInitValueUse is set to DEFAULT_INIT_VALUE_ENABLE.
- ***uint32_t CRC_InitTypeDef::InputDataInversionMode***
  This parameter is a value of ***CRCEx_Input_Data_Inversion*** and specifies input data inversion mode. Can be either one of the following values
  - **CRC_INPUTDATA_INVERSION_NONE** no input data inversion
  - **CRC_INPUTDATA_INVERSION_BYTE** byte-wise inversion, 0x1A2B3C4D becomes 0x58D43CB2
  - **CRC_INPUTDATA_INVERSION_HALFWORD** halfword-wise inversion, 0x1A2B3C4D becomes 0xD458B23C
  - **CRC_INPUTDATA_INVERSION_WORD** word-wise inversion, 0x1A2B3C4D becomes 0xB23CD458

- ***uint32_t CRC_InitTypeDef::OutputDataInversionMode***
  This parameter is a value of ***CRCEx_Output_Data_Inversion*** and specifies output data (i.e. CRC) inversion mode. Can be either
  - **CRC_OUTPUTDATA_INVERSION_DISABLE** no CRC inversion,
  - **CRC_OUTPUTDATA_INVERSION_ENABLE** CRC 0x11223344 is converted into 0x22CC4488

13.1.2 CRC_HandleTypeDef

CRC_HandleTypeDef is defined in the stm32h5xx_hal_crc.h

Data Fields

- ***CRC_TypeDef * Instance***
- ***CRC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CRC_StateTypeDef State***
- ***uint32_t InputDataFormat***

Field Documentation

- ***CRC_TypeDef* CRC_HandleTypeDef::Instance***
  Register base address
- ***CRC_InitTypeDef CRC_HandleTypeDef::Init***
  CRC configuration parameters
- ***HAL_LockTypeDef CRC_HandleTypeDef::Lock***
  CRC Locking object
- ***__IO HAL_CRC_StateTypeDef CRC_HandleTypeDef::State***
  CRC communication state
- ***uint32_t CRC_HandleTypeDef::InputDataFormat***
  This parameter is a value of ***CRC_Input_Buffer_Format*** and specifies input data format. Can be either
  - **CRC_INPUTDATA_FORMAT_BYTES** input data is a stream of bytes (8-bit data)
  - **CRC_INPUTDATA_FORMAT_HALFWORDS** input data is a stream of half-words (16-bit data)
  - **CRC_INPUTDATA_FORMAT_WORDS** input data is a stream of words (32-bit data)

  Note that constant CRC_INPUT_FORMAT_UNDEFINED is defined but an initialization error must occur if InputBufferFormat is not one of the three values listed above

13.2 CRC Firmware driver API description

The following section lists the various functions of the CRC library.

13.2.1 How to use this driver

- Enable CRC AHB clock using __HAL_RCC_CRC_CLK_ENABLE();
- Initialize CRC calculator
  - specify generating polynomial (peripheral default or non-default one)
  - specify initialization value (peripheral default or non-default one)
  - specify input data format
  - specify input or output data inversion mode if any
- Use HAL_CRC_Accumulate() function to compute the CRC value of the input data buffer starting with the previously computed CRC as initialization value
- Use HAL_CRC_Calculate() function to compute the CRC value of the input data buffer starting with the defined initialization value (default or non-default) to initiate CRC calculation

13.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the CRC according to the specified parameters in the CRC_InitTypeDef and create the associated handle
- DeInitialize the CRC peripheral

- Initialize the CRC MSP (MCU Specific Package)
- DeInitialize the CRC MSP

This section contains the following APIs:

- ***HAL_CRC_Init()***
- ***HAL_CRC_DeInit()***
- ***HAL_CRC_MspInit()***
- ***HAL_CRC_MspDeInit()***

13.2.3 Peripheral Control functions

This section provides functions allowing to:

- compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer using combination of the previous CRC value and the new one.

or

- compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer independently of the previous CRC value.

This section contains the following APIs:

- ***HAL_CRC_Accumulate()***
- ***HAL_CRC_Calculate()***

13.2.4 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- ***HAL_CRC_GetState()***

13.2.5 Detailed description of functions

HAL_CRC_Init

Function name

HAL_StatusTypeDef HAL_CRC_Init (CRC_HandleTypeDef * hcrc)

Function description

Initialize the CRC according to the specified parameters in the CRC_InitTypeDef and create the associated handle.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** status

HAL_CRC_DeInit

Function name

HAL_StatusTypeDef HAL_CRC_DeInit (CRC_HandleTypeDef * hcrc)

Function description

DeInitialize the CRC peripheral.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** status

HAL_CRC_MspInit

Function name

void HAL_CRC_MspInit (CRC_HandleTypeDef * hcrc)

Function description

Initializes the CRC MSP.

Parameters

- **hcrc:** CRC handle

Return values

- **None:**

HAL_CRC_MspDeInit

Function name

void HAL_CRC_MspDeInit (CRC_HandleTypeDef * hcrc)

Function description

DeInitialize the CRC MSP.

Parameters

- **hcrc:** CRC handle

Return values

- **None:**

HAL_CRC_Accumulate

Function name

uint32_t HAL_CRC_Accumulate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with the previously computed CRC as initialization value.

Parameters

- **hcrc:** CRC handle
- **pBuffer:** pointer to the input data buffer, exact input data format is provided by hcrc->InputDataFormat.
- **BufferLength:** input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).

Return values

- **uint32_t:** CRC (returned value LSBs for CRC shorter than 32 bits)

Notes

- By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc->InputDataFormat.

HAL_CRC_Calculate

Function name

uint32_t HAL_CRC_Calculate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with hcrc->Instance->INIT as initialization value.

Parameters

- **hcrc:** CRC handle
- **pBuffer:** pointer to the input data buffer, exact input data format is provided by hcrc->InputDataFormat.
- **BufferLength:** input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).

Return values

- **uint32_t:** CRC (returned value LSBs for CRC shorter than 32 bits)

Notes

- By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc->InputDataFormat.

HAL_CRC_GetState

Function name

HAL_CRC_StateTypeDef HAL_CRC_GetState (const CRC_HandleTypeDef * hcrc)

Function description

Return the CRC handle state.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** state

13.3 CRC Firmware driver defines

The following section lists the various define and macros of the module.

13.3.1 CRC

CRC

Default CRC computation initialization value

DEFAULT_CRC_INITVALUE

Initial CRC default value

Indicates whether or not default init value is used

DEFAULT_INIT_VALUE_ENABLE

Enable initial CRC default value

DEFAULT_INIT_VALUE_DISABLE

Disable initial CRC default value

Indicates whether or not default polynomial is used

DEFAULT_POLYNOMIAL_ENABLE

Enable default generating polynomial 0x04C11DB7

DEFAULT_POLYNOMIAL_DISABLE

Disable default generating polynomial 0x04C11DB7

Default CRC generating polynomial

DEFAULT_CRC32_POLY

X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1

CRC Exported Macros

__HAL_CRC_RESET_HANDLE_STATE

Description:

- Reset CRC handle state.

Parameters:

- __HANDLE__: CRC handle.

Return value:

- None

__HAL_CRC_DR_RESET

Description:

- Reset CRC Data Register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_INITIALCRCVALUE_CONFIG

Description:

- Set CRC INIT non-default value.

Parameters:

- __HANDLE__: CRC handle
- __INIT__: 32-bit initial value

Return value:

- None

__HAL_CRC_SET_IDR

Description:

- Store data in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle
- __VALUE__: Value to be stored in the ID register

Return value:

- None

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

__HAL_CRC_GET_IDR

Description:

- Return the data stored in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- Value: of the ID register

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

Input Buffer Format

CRC_INPUTDATA_FORMAT_UNDEFINED

Undefined input data format

CRC_INPUTDATA_FORMAT_BYTES

Input data in byte format

CRC_INPUTDATA_FORMAT_HALFWORDS

Input data in half-word format

CRC_INPUTDATA_FORMAT_WORDS

Input data in word format

Polynomial sizes to configure the peripheral

CRC_POLYLENGTH_32B

Resort to a 32-bit long generating polynomial

CRC_POLYLENGTH_16B

Resort to a 16-bit long generating polynomial

CRC_POLYLENGTH_8B

Resort to a 8-bit long generating polynomial

CRC_POLYLENGTH_7B

Resort to a 7-bit long generating polynomial

CRC polynomial possible sizes actual definitions

HAL_CRC_LENGTH_32B

32-bit long CRC

HAL_CRC_LENGTH_16B

16-bit long CRC

HAL_CRC_LENGTH_8B

8-bit long CRC

HAL_CRC_LENGTH_7B

7-bit long CRC

14 HAL CRC Extension Driver

14.1 CRCEx Firmware driver API description

The following section lists the various functions of the CRCEx library.

14.1.1 How to use this driver

- Set user-defined generating polynomial through HAL_CRCEx_Polynomial_Set()
- Configure Input or Output data inversion

14.1.2 Extended configuration functions

This section provides functions allowing to:

- Configure the generating polynomial
- Configure the input data inversion
- Configure the output data inversion

This section contains the following APIs:

- ***HAL_CRCEx_Polynomial_Set()***
- ***HAL_CRCEx_Input_Data_Reverse()***
- ***HAL_CRCEx_Output_Data_Reverse()***

14.1.3 Detailed description of functions

HAL_CRCEx_Polynomial_Set

Function name

HAL_StatusTypeDef HAL_CRCEx_Polynomial_Set (CRC_HandleTypeDef * hcrc, uint32_t Pol, uint32_t PolyLength)

Function description

Initialize the CRC polynomial if different from default one.

Parameters

- **hcrc:** CRC handle
- **Pol:** CRC generating polynomial (7, 8, 16 or 32-bit long). This parameter is written in normal representation, e.g.
  - for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65
  - for a polynomial of degree 16, X^16 + X^12 + X^5 + 1 is written 0x1021
- **PolyLength:** CRC polynomial length. This parameter can be one of the following values:
  - CRC_POLYLENGTH_7B 7-bit long CRC (generating polynomial of degree 7)
  - CRC_POLYLENGTH_8B 8-bit long CRC (generating polynomial of degree 8)
  - CRC_POLYLENGTH_16B 16-bit long CRC (generating polynomial of degree 16)
  - CRC_POLYLENGTH_32B 32-bit long CRC (generating polynomial of degree 32)

Return values

- **HAL:** status

HAL_CRCEx_Input_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Input_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t InputReverseMode)

Function description

Set the Reverse Input data mode.

Parameters

- **hcrc:** CRC handle
- **InputReverseMode:** Input Data inversion mode. This parameter can be one of the following values:
  - CRC_INPUTDATA_INVERSION_NONE no change in bit order (default value)
  - CRC_INPUTDATA_INVERSION_BYTE Byte-wise bit reversal
  - CRC_INPUTDATA_INVERSION_HALFWORD HalfWord-wise bit reversal
  - CRC_INPUTDATA_INVERSION_WORD Word-wise bit reversal

Return values

- **HAL:** status

HAL_CRCEx_Output_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Output_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t OutputReverseMode)

Function description

Set the Reverse Output data mode.

Parameters

- **hcrc:** CRC handle
- **OutputReverseMode:** Output Data inversion mode. This parameter can be one of the following values:
  - CRC_OUTPUTDATA_INVERSION_DISABLE no CRC inversion (default value)
  - CRC_OUTPUTDATA_INVERSION_ENABLE bit-level inversion (e.g. for a 8-bit CRC: 0xB5 becomes 0xAD)

Return values

- **HAL:** status

14.2 CRCEx Firmware driver defines

The following section lists the various define and macros of the module.

14.2.1 CRCEx

CRCEx

CRC Extended Exported Macros

__HAL_CRC_OUTPUTREVERSAL_ENABLE

Description:

- Set CRC output reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_OUTPUTREVERSAL_DISABLE

Description:

- Unset CRC output reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_POLYNOMIAL_CONFIG

Description:

- Set CRC non-default polynomial.

Parameters:

- __HANDLE__: CRC handle
- __POLYNOMIAL__: 7, 8, 16 or 32-bit polynomial

Return value:

- None

Input Data Inversion Modes

CRC_INPUTDATA_INVERSION_NONE

No input data inversion

CRC_INPUTDATA_INVERSION_BYTE

Byte-wise input data inversion

CRC_INPUTDATA_INVERSION_HALFWORD

HalfWord-wise input data inversion

CRC_INPUTDATA_INVERSION_WORD

Word-wise input data inversion

Output Data Inversion Modes

CRC_OUTPUTDATA_INVERSION_DISABLE

No output data inversion

CRC_OUTPUTDATA_INVERSION_ENABLE

Bit-wise output data inversion

15 HAL CRYP Generic Driver

15.1 CRYP Firmware driver registers structures

15.1.1 CRYP_ConfigTypeDef

CRYP_ConfigTypeDef is defined in the stm32h5xx_hal_cryp.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint32_t * pKey***
- ***uint32_t * pInitVect***
- ***uint32_t Algorithm***
- ***uint32_t * Header***
- ***uint32_t HeaderSize***
- ***uint32_t * B0***
- ***uint32_t DataWidthUnit***
- ***uint32_t HeaderWidthUnit***
- ***uint32_t KeyIVConfigSkip***
- ***uint32_t KeyMode***
- ***uint32_t KeySelect***
- ***uint32_t KeyProtection***

Field Documentation

- ***uint32_t CRYP_ConfigTypeDef::DataType***
  32-bit data, 16-bit data, 8-bit data or 1-bit string. This parameter can be a value of ***CRYP_Data_Type***
- ***uint32_t CRYP_ConfigTypeDef::KeySize***
  Used only in AES mode : 128, 192 or 256 bit key length in CRYP1. 128 or 256 bit key length in TinyAES This parameter can be a value of ***CRYP_Key_Size***
- ***uint32_t* CRYP_ConfigTypeDef::pKey***
  The key used for encryption/decryption
- ***uint32_t* CRYP_ConfigTypeDef::pInitVect***
  The initialization vector used also as initialization counter in CTR mode
- ***uint32_t CRYP_ConfigTypeDef::Algorithm***
  DES/ TDES Algorithm ECB/CBC AES Algorithm ECB/CBC/CTR/GCM or CCM This parameter can be a value of ***CRYP_Algorithm_Mode***
- ***uint32_t* CRYP_ConfigTypeDef::Header***
  used only in AES GCM and CCM Algorithm for authentication, GCM : also known as Additional Authentication Data CCM : named B1 composed of the associated data length and Associated Data.
- ***uint32_t CRYP_ConfigTypeDef::HeaderSize***
  The size of header buffer
- ***uint32_t* CRYP_ConfigTypeDef::B0***
  B0 is first authentication block used only in AES CCM mode
- ***uint32_t CRYP_ConfigTypeDef::DataWidthUnit***
  Payload Data Width Unit, this parameter can be value of ***CRYP_Data_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::HeaderWidthUnit***
  Header Width Unit, this parameter can be value of ***CRYP_Header_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::KeyIVConfigSkip***
  CRYP peripheral Key and IV configuration skip, to config Key and Initialization Vector only once and to skip configuration for consecutive processings. This parameter can be a value of ***CRYP_Configuration_Skip***
- ***uint32_t CRYP_ConfigTypeDef::KeyMode***
  Key mode selection, this parameter can be value of ***CRYP_Key_Mode***
- ***uint32_t CRYP_ConfigTypeDef::KeySelect***
  Only for SAES : Key selection, this parameter can be value of ***CRYP_Key_Select***

- ***uint32_t CRYP_ConfigTypeDef::KeyProtection***
  Only for SAES : Key protection, this parameter can be value of ***CRYP_Key_Protection***

15.1.2 CRYP_ContextTypeDef

CRYP_ContextTypeDef is defined in the stm32h5xx_hal_cryp.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint32_t * pKey***
- ***uint32_t * pInitVect***
- ***uint32_t Algorithm***
- ***uint32_t DataWidthUnit***
- ***uint32_t KeyIVConfigSkip***
- ***uint32_t KeyMode***
- ***uint32_t Phase***
- ***uint32_t KeyIVConfig***
- ***uint32_t CR_Reg***
- ***uint32_t IER_Reg***
- ***uint32_t IVR0_Reg***
- ***uint32_t IVR1_Reg***
- ***uint32_t IVR2_Reg***
- ***uint32_t IVR3_Reg***

Field Documentation

- ***uint32_t CRYP_ContextTypeDef::DataType***
  This parameter can be a value of ***CRYP_Data_Type***
- ***uint32_t CRYP_ContextTypeDef::KeySize***
  This parameter can be a value of ***CRYP_Key_Size***
- ***uint32_t* CRYP_ContextTypeDef::pKey***
  The key used for encryption/decryption
- ***uint32_t* CRYP_ContextTypeDef::pInitVect***
  The initialization vector, counter with CBC and CTR Algorithm
- ***uint32_t CRYP_ContextTypeDef::Algorithm***
  This parameter can be a value of ***CRYP_Algorithm_Mode***
- ***uint32_t CRYP_ContextTypeDef::DataWidthUnit***
  This parameter can be value of ***CRYP_Data_Width_Unit***
- ***uint32_t CRYP_ContextTypeDef::KeyIVConfigSkip***
  This parameter can be a value of ***CRYP_Configuration_Skip***
- ***uint32_t CRYP_ContextTypeDef::KeyMode***
  This parameter can be value of ***CRYP_Key_Mode***
- ***uint32_t CRYP_ContextTypeDef::Phase***
  CRYP peripheral phase
- ***uint32_t CRYP_ContextTypeDef::KeyIVConfig***
  CRYP peripheral Key and IV configuration flag
- ***uint32_t CRYP_ContextTypeDef::CR_Reg***
  CRYP CR register
- ***uint32_t CRYP_ContextTypeDef::IER_Reg***
  CRYP IER register
- ***uint32_t CRYP_ContextTypeDef::IVR0_Reg***
  CRYP IVR0 register
- ***uint32_t CRYP_ContextTypeDef::IVR1_Reg***
  CRYP IVR1 register
- ***uint32_t CRYP_ContextTypeDef::IVR2_Reg***
  CRYP IVR2 register

- ***uint32_t CRYP_ContextTypeDef::IVR3_Reg***
  CRYP IVR3 register

15.1.3 __CRYP_HandleTypeDef

__CRYP_HandleTypeDef is defined in the stm32h5xx_hal_cryp.h

Data Fields

- ***AES_TypeDef * Instance***
- ***CRYP_ConfigTypeDef Init***
- ***uint32_t * pCrypInBuffPtr***
- ***uint32_t * pCrypOutBuffPtr***

- ***void(* MspDeInitCallback***

Field Documentation

- ***AES_TypeDef* __CRYP_HandleTypeDef::Instance***
  AES Register base address
- ***CRYP_ConfigTypeDef __CRYP_HandleTypeDef::Init***
  CRYP required parameters
- ***uint32_t* __CRYP_HandleTypeDef::pCrypInBuffPtr***
  Pointer to CRYP processing (encryption, decryption,...) buffer
- ***uint32_t* __CRYP_HandleTypeDef::pCrypOutBuffPtr***
  Pointer to CRYP processing (encryption, decryption,...) buffer
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypHeaderCount***
  Counter of header data in words
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypInCount***
  Counter of input data in words
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypOutCount***
  Counter of output data in words
- ***uint16_t __CRYP_HandleTypeDef::Size***
  length of input data in word or in byte, according to DataWidthUnit
- ***uint32_t __CRYP_HandleTypeDef::Phase***
  CRYP peripheral phase
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmain***
  CRYP In DMA handle parameters
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmaout***
  CRYP Out DMA handle parameters
- ***HAL_LockTypeDef __CRYP_HandleTypeDef::Lock***
  CRYP locking object

- ***__IO HAL_CRYP_STATETypeDef __CRYP_HandleTypeDef::State***
  CRYP peripheral state
- ***__IO uint32_t __CRYP_HandleTypeDef::ErrorCode***
  CRYP peripheral error code
- ***uint32_t __CRYP_HandleTypeDef::KeyIVConfig***
  CRYP peripheral Key and IV configuration flag, used when configuration can be skipped
- ***uint32_t __CRYP_HandleTypeDef::SizesSum***
  Sum of successive payloads lengths (in bytes), stored for a single signature computation after several messages processing
- ***void(* __CRYP_HandleTypeDef::InCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Input FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::OutCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Output FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::ErrorCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Error callback
- ***void(* __CRYP_HandleTypeDef::MspInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp Init callback
- ***void(* __CRYP_HandleTypeDef::MspDeInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp DeInit callback

15.2 CRYP Firmware driver API description

The following section lists the various functions of the CRYP library.

15.2.1 How to use this driver

The CRYP HAL driver can be used as follows:

1. Initialize the CRYP low level resources by implementing the HAL_CRYP_MspInit():
   a. Enable the CRYP interface clock using __HAL_RCC_CRYP_CLK_ENABLE()or __HAL_RCC_AES_CLK_ENABLE
   b. In case of using interrupts (e.g. HAL_CRYP_Encrypt_IT())
      - Configure the CRYP interrupt priority using HAL_NVIC_SetPriority()
      - Enable the CRYP IRQ handler using HAL_NVIC_EnableIRQ()
      - In CRYP IRQ handler, call HAL_CRYP_IRQHandler()
   c. In case of using DMA to control data transfer (e.g. HAL_CRYP_Encrypt_DMA())
      - Enable the DMAx interface clock using __RCC_DMAx_CLK_ENABLE()
      - Configure and enable two DMA channels one for managing data transfer from memory to peripheral (input channel) and another channel for managing data transfer from peripheral to memory (output channel)
      - Associate the initialized DMA handle to the CRYP DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the two DMA channels. The output channel should have higher priority than the input channel HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()

2. Initialize the CRYP according to the specified parameters :
   a. The data type: 1-bit, 8-bit, 16-bit or 32-bit.
   b. The key size: 128, 192 or 256.
   c. The AES Algorithm ECB/CBC/CTR/GCM or CCM.
   d. The initialization vector (counter). It is not used in ECB mode.
   e. The key buffer used for encryption/decryption.
      - In some specific configurations, the key is written by the application code out of the HAL scope. In that case, user can still resort to the HAL APIs as usual but must make sure that pKey pointer is set to NULL.
   f. The DataWidthUnit field. It specifies whether the data length (or the payload length for authentication algorithms) is in words or bytes.
   g. The Header used only in AES GCM and CCM Algorithm for authentication.
   h. The HeaderSize used to give size of header buffer in word or bytes, depending upon HeaderWidthUnit field.
   i. The HeaderWidthUnit field. It specifies whether the header length (for authentication algorithms) is in words or bytes.
   j. The B0 block is the first authentication block used only in AES CCM mode.
   k. The KeyIVConfigSkip used to process several messages in a row.
   l. The KeyMode used to special key operation modes (for SAES : wrapped key, shared key with AES peripheral).
   m. The KeySelect, Only for SAES, used to select key from different key source.
   n. The KeyProtection, Only for SAES, used for security context enforcement.
3. Three processing (encryption/decryption) functions are available:
   a. Polling mode: encryption and decryption APIs are blocking functions i.e. they process the data and wait till the processing is finished, e.g. HAL_CRYP_Encrypt & HAL_CRYP_Decrypt
   b. Interrupt mode: encryption and decryption APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_CRYP_Encrypt_IT & HAL_CRYP_Decrypt_IT
   c. DMA mode: encryption and decryption APIs are not blocking functions i.e. the data transfer is ensured by DMA, e.g. HAL_CRYP_Encrypt_DMA & HAL_CRYP_Decrypt_DMA
4. When the processing function is called at first time after HAL_CRYP_Init() the CRYP peripheral is configured and processes the buffer in input. At second call, no need to Initialize the CRYP, user have to get current configuration via HAL_CRYP_GetConfig() API, then only HAL_CRYP_SetConfig() is requested to set new parameters, finally user can start encryption/decryption.
5. Call HAL_CRYP_DeInit() to deinitialize the CRYP peripheral.
6. To process a single message with consecutive calls to HAL_CRYP_Encrypt() or HAL_CRYP_Decrypt() without having to configure again the Key or the Initialization Vector between each API call, the field KeyIVConfigSkip of the initialization structure must be set to CRYP_KEYIVCONFIG_ONCE. Same is true for consecutive calls of HAL_CRYP_Encrypt_IT(), HAL_CRYP_Decrypt_IT(), HAL_CRYP_Encrypt_DMA() or HAL_CRYP_Decrypt_DMA().

The cryptographic processor supports following standards:

1. The advanced encryption standard (AES) supported:
   a. 128-bit data block processing
   b. chaining modes supported :
      - Electronic Code Book(ECB)
      - Cipher Block Chaining (CBC)
      - Counter mode (CTR)
      - Galois/counter mode (GCM/GMAC)
      - Counter with Cipher Block Chaining-Message(CCM)
   c. keys length Supported : 128-bit and 256-bit

Note: *Specific care must be taken to format the key and the Initialization Vector IV!*

If the key is defined as a 128-bit long array key[127..0] = {b127 ... b0} where b127 is the MSB and b0 the LSB, the key must be stored in MCU memory

- as a sequence of words where the MSB word comes first (occupies the lowest memory address)
  - address n+0 : 0b b127 .. b120 b119 .. b112 b111 .. b104 b103 .. b96
  - address n+4 : 0b b95 .. b88 b87 .. b80 b79 .. b72 b71 .. b64
  - address n+8 : 0b b63 .. b56 b55 .. b48 b47 .. b40 b39 .. b32
  - address n+C : 0b b31 .. b24 b23 .. b16 b15 .. b8 b7 .. b0

Hereafter, another illustration when considering a 128-bit long key made of 16 bytes {B15..B0}. The 4 32-bit words that make the key must be stored as follows in MCU memory:

- address n+0 : 0x B15 B14 B13 B12
- address n+4 : 0x B11 B10 B9 B8
- address n+8 : 0x B7 B6 B5 B4
- address n+C : 0x B3 B2 B1 B0

which leads to the expected setting

- AES_KEYR3 = 0x B15 B14 B13 B12
- AES_KEYR2 = 0x B11 B10 B9 B8
- AES_KEYR1 = 0x B7 B6 B5 B4
- AES_KEYR0 = 0x B3 B2 B1 B0

Same format must be applied for a 256-bit long key made of 32 bytes {B31..B0}. The 8 32-bit words that make the key must be stored as follows in MCU memory:

- address n+00 : 0x B31 B30 B29 B28
- address n+04 : 0x B27 B26 B25 B24
- address n+08 : 0x B23 B22 B21 B20
- address n+0C : 0x B19 B18 B17 B16
- address n+10 : 0x B15 B14 B13 B12
- address n+14 : 0x B11 B10 B9 B8
- address n+18 : 0x B7 B6 B5 B4
- address n+1C : 0x B3 B2 B1 B0

which leads to the expected setting

- AES_KEYR7 = 0x B31 B30 B29 B28
- AES_KEYR6 = 0x B27 B26 B25 B24
- AES_KEYR5 = 0x B23 B22 B21 B20
- AES_KEYR4 = 0x B19 B18 B17 B16
- AES_KEYR3 = 0x B15 B14 B13 B12
- AES_KEYR2 = 0x B11 B10 B9 B8
- AES_KEYR1 = 0x B7 B6 B5 B4
- AES_KEYR0 = 0x B3 B2 B1 B0

Initialization Vector IV (4 32-bit words) format must follow the same as that of a 128-bit long key.

Note that key and IV registers are not sensitive to swap mode selection.

This section describes the AES Galois/counter mode (GCM) supported by the peripherals:

1. Algorithm supported :
   a. Galois/counter mode (GCM)
   b. Galois message authentication code (GMAC) :is exactly the same as GCM algorithm composed only by an header.
2. Four phases are performed in GCM :
   a. Init phase: peripheral prepares the GCM hash subkey (H) and do the IV processing
   b. Header phase: peripheral processes the Additional Authenticated Data (AAD), with hash computation only.
   c. Payload phase: peripheral processes the plaintext (P) with hash computation + keystream encryption + data XORing. It works in a similar way for ciphertext (C).
   d. Final phase: peripheral generates the authenticated tag (T) using the last block of data. HAL_CRYPEx_AESGCM_GenerateAuthTAG API used in this phase to generate 4 words which correspond to the Tag. user should consider only part of this 4 words, if Tag length is less than 128 bits.

3. structure of message construction in GCM is defined as below :
   a. 16 bytes Initial Counter Block (ICB)composed of IV and counter
   b. The authenticated header A (also knows as Additional Authentication Data AAD) this part of the message is only authenticated, not encrypted.
   c. The plaintext message P is both authenticated and encrypted as ciphertext. GCM standard specifies that ciphertext has same bit length as the plaintext.
   d. The last block is composed of the length of A (on 64 bits) and the length of ciphertext (on 64 bits)

A more detailed description of the GCM message structure is available below.

This section describe The AES Counter with Cipher Block Chaining-Message Authentication Code (CCM) supported by the peripheral:

1. Specific parameters for CCM :
   a. B0 block : follows NIST Special Publication 800-38C,
   b. B1 block (header)
   c. CTRx block : control blocks

A detailed description of the CCM message structure is available below.

1. CCM in peripheral:
   a. To perform message payload encryption or decryption AES is configured in CTR mode.
   b. For authentication two phases are performed : - Header phase: peripheral processes the Additional Authenticated Data (AAD) first, then the cleartext message only cleartext payload (not the ciphertext payload) is used and no output.
   c. Final phase: peripheral generates the authenticated tag (T) using the last block of data. HAL_CRYPEx_AESCCM_GenerateAuthTAG API used in this phase to generate 4 words which correspond to the Tag. user should consider only part of this 4 words, if Tag length is less than 128 bits

Callback registration

The compilation define USE_HAL_CRYP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_CRYP_RegisterCallback() or HAL_CRYP_RegisterXXXCallback() to register an interrupt callback.

Function @ref HAL_CRYP_RegisterCallback() allows to register following callbacks:

- InCpltCallback : Input FIFO transfer completed callback.
- OutCpltCallback : Output FIFO transfer completed callback.
- ErrorCallback : callback for error detection.
- MspInitCallback : CRYP MspInit.
- MspDeInitCallback : CRYP MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_CRYP_UnRegisterCallback() to reset a callback to the default weak function. @ref HAL_CRYP_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- InCpltCallback : Input FIFO transfer completed callback.
- OutCpltCallback : Output FIFO transfer completed callback.
- ErrorCallback : callback for error detection.
- MspInitCallback : CRYP MspInit.
- MspDeInitCallback : CRYP MspDeInit.

By default, after the @ref HAL_CRYP_Init() and when the state is HAL_CRYP_STATE_RESET all callbacks are set to the corresponding weak functions : examples @ref HAL_CRYP_InCpltCallback() , @ref HAL_CRYP_OutCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak function in the @ref HAL_CRYP_Init()/ @ref HAL_CRYP_DeInit() only when these callbacks are null (not registered beforehand). if not, MspInit or MspDeInit are not null, the @ref HAL_CRYP_Init() / @ref HAL_CRYP_DeInit() keep and use the user MspInit/MspDeInit functions (registered beforehand)

Callbacks can be registered/unregistered in HAL_CRYP_STATE_READY state only. Exception done MspInit/ MspDeInit callbacks that can be registered/unregistered in HAL_CRYP_STATE_READY or HAL_CRYP_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_CRYP_RegisterCallback() before calling @ref HAL_CRYP_DeInit() or @ref HAL_CRYP_Init() function.

When The compilation define USE_HAL_CRYP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Suspend/Resume feature

The compilation define USE_HAL_CRYP_SUSPEND_RESUME when set to 1 allows the user to resort to the suspend/resume feature. A low priority block processing can be suspended to process a high priority block instead. When the high priority block processing is over, the low priority block processing can be resumed, restarting from the point where it was suspended. This feature is applicable only in non-blocking interrupt mode.

User must resort to HAL_CRYP_Suspend() to suspend the low priority block processing. This API manages the hardware block processing suspension and saves all the internal data that will be needed to restart later on. Upon HAL_CRYP_Suspend() completion, the user can launch the processing of any other block (high priority block processing).

When the high priority block processing is over, user must invoke HAL_CRYP_Resume() to resume the low priority block processing. Ciphering (or deciphering) restarts from the suspension point and ends as usual.

HAL_CRYP_Suspend() reports an error when the suspension request is sent too late (i.e when the low priority block processing is about to end). There is no use to suspend the tag generation processing for authentication algorithms.

Note: If the key is written out of HAL scope (case pKey pointer set to NULL by the user), the block processing suspension/resumption mechanism is NOT applicable.

Note: If the Key and Initialization Vector are configured only once and configuration is skipped for consecutive processings (case KeyIVConfigSkip set to CRYP_KEYIVCONFIG_ONCE), the block processing suspension/ resumption mechanism is NOT applicable.

15.2.2 Initialization, de-initialization and Set and Get configuration functions

This section provides functions allowing to:

- Initialize the CRYP
- DeInitialize the CRYP
- Initialize the CRYP MSP
- DeInitialize the CRYP MSP
- configure CRYP (HAL_CRYP_SetConfig) with the specified parameters in the CRYP_ConfigTypeDef Parameters which are configured in This section are :
- Key size
- Data Type : 32,16, 8 or 1bit
- AlgoMode : ECB,CBC,CTR,GCM/GMAC and CCM in AES Standard.
- Get CRYP configuration (HAL_CRYP_GetConfig) from the specified parameters in the CRYP_HandleTypeDef
- For interleave mode, API HAL_CRYP_SaveContext and HAL_CRYP_RestoreContext to be used to save then Restore CRYP configuration and parameters. CRYP_IVCONFIG_ONCE should be selected for KeyIVConfigSkip parameter. Only polling mode is supported, interleave mode should be used with HAL_CRYP_Encrypt and HAL_CRYP_Decrypt API.

This section contains the following APIs:

- ***HAL_CRYP_Init()***
- ***HAL_CRYP_DeInit()***
- ***HAL_CRYP_SetConfig()***
- ***HAL_CRYP_GetConfig()***
- ***HAL_CRYP_MspInit()***
- ***HAL_CRYP_MspDeInit()***
- ***HAL_CRYP_RegisterCallback()***
- ***HAL_CRYP_UnRegisterCallback()***
- ***HAL_CRYP_SaveContext()***
- ***HAL_CRYP_RestoreContext()***

15.2.3 Encrypt Decrypt functions

This section provides API allowing to Encrypt/Decrypt Data following

- Standard AES algorithms supported by the peripheral: - Electronic Code Book(ECB) - Cipher Block Chaining (CBC) - Counter mode (CTR) - Cipher Block Chaining (CBC) - Counter mode (CTR) - Galois/ counter mode (GCM) - Counter with Cipher Block Chaining-Message(CCM)

Three processing functions are available:

- Polling mode : HAL_CRYP_Encrypt & HAL_CRYP_Decrypt
- Interrupt mode : HAL_CRYP_Encrypt_IT & HAL_CRYP_Decrypt_IT
- DMA mode : HAL_CRYP_Encrypt_DMA & HAL_CRYP_Decrypt_DMA

This section contains the following APIs:

- ***HAL_CRYP_Encrypt()***
- ***HAL_CRYP_Decrypt()***
- ***HAL_CRYP_Encrypt_IT()***
- ***HAL_CRYP_Decrypt_IT()***
- ***HAL_CRYP_Encrypt_DMA()***
- ***HAL_CRYP_Decrypt_DMA()***

15.2.4 CRYP IRQ handler management

This section provides CRYP IRQ handler and callback functions.

- HAL_CRYP_IRQHandler CRYP interrupt request
- HAL_CRYP_InCpltCallback input data transfer complete callback
- HAL_CRYP_OutCpltCallback output data transfer complete callback
- HAL_CRYP_ErrorCallback CRYP error callback
- HAL_CRYP_GetState return the CRYP state
- HAL_CRYP_GetError return the CRYP error code

This section contains the following APIs:

- ***HAL_CRYP_IRQHandler()***
- ***HAL_CRYP_GetError()***
- ***HAL_CRYP_GetState()***
- ***HAL_CRYP_InCpltCallback()***
- ***HAL_CRYP_OutCpltCallback()***
- ***HAL_CRYP_ErrorCallback()***

15.2.5 Detailed description of functions

HAL_CRYP_Init

Function name

HAL_StatusTypeDef HAL_CRYP_Init (CRYP_HandleTypeDef * hcryp)

Function description

Initializes the CRYP according to the specified parameters in the CRYP_ConfigTypeDef and creates the associated handle.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_DeInit

Function name

HAL_StatusTypeDef HAL_CRYP_DeInit (CRYP_HandleTypeDef * hcryp)

Function description

De-Initializes the CRYP peripheral.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_MspInit

Function name

void HAL_CRYP_MspInit (CRYP_HandleTypeDef * hcryp)

Function description

Initializes the CRYP MSP.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_MspDeInit

Function name

void HAL_CRYP_MspDeInit (CRYP_HandleTypeDef * hcryp)

Function description

DeInitializes CRYP MSP.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_SetConfig

Function name

HAL_StatusTypeDef HAL_CRYP_SetConfig (CRYP_HandleTypeDef * hcryp, CRYP_ConfigTypeDef * pConf)

Function description

Configure the CRYP according to the specified parameters in the CRYP_ConfigTypeDef.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure
- **pConf:** pointer to a CRYP_ConfigTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_GetConfig

Function name

HAL_StatusTypeDef HAL_CRYP_GetConfig (CRYP_HandleTypeDef * hcryp, CRYP_ConfigTypeDef * pConf)

Function description

Get CRYP Configuration parameters in associated handle.

Parameters

- **pConf:** pointer to a CRYP_ConfigTypeDef structure
- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CRYP_RegisterCallback (CRYP_HandleTypeDef * hcryp, HAL_CRYP_CallbackIDTypeDef CallbackID, pCRYP_CallbackTypeDef pCallback)

Function description

Register a User CRYP Callback To be used instead of the weak predefined callback.

Parameters

- **hcryp:** cryp handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_CRYP_INPUT_COMPLETE_CB_ID Input FIFO transfer completed callback ID
  - HAL_CRYP_OUTPUT_COMPLETE_CB_ID Output FIFO transfer completed callback ID
  - HAL_CRYP_ERROR_CB_ID Error callback ID
  - HAL_CRYP_MSPINIT_CB_ID MspInit callback ID
  - HAL_CRYP_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_CRYP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CRYP_UnRegisterCallback (CRYP_HandleTypeDef * hcryp, HAL_CRYP_CallbackIDTypeDef CallbackID)

Function description

Unregister an CRYP Callback CRYP callback is redirected to the weak predefined callback.

Parameters

- **hcryp:** cryp handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CRYP_INPUT_COMPLETE_CB_ID Input FIFO transfer completed callback ID
  - HAL_CRYP_OUTPUT_COMPLETE_CB_ID Output FIFO transfer completed callback ID
  - HAL_CRYP_ERROR_CB_ID Error callback ID
  - HAL_CRYP_MSPINIT_CB_ID MspInit callback ID
  - HAL_CRYP_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_CRYP_SaveContext

Function name

HAL_StatusTypeDef HAL_CRYP_SaveContext (CRYP_HandleTypeDef * hcryp, CRYP_ContextTypeDef * pcont)

Function description

CRYP peripheral parameters storage when processing Interleaved mode .

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pcont:** pointer to a CRYP_ContextTypeDef structure where CRYP parameters will be stored.

Return values

- **HAL:** status

HAL_CRYP_RestoreContext

Function name

HAL_StatusTypeDef HAL_CRYP_RestoreContext (CRYP_HandleTypeDef * hcryp, CRYP_ContextTypeDef * pcont)

Function description

Restore CRYP parameters needed for Interleaved mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pcont:** pointer to a CRYP_ContextTypeDef structure that contains CRYP parameters stored.

Return values

- **HAL:** status

HAL_CRYP_Encrypt

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput, uint32_t Timeout)

Function description

Encryption mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (plaintext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(ciphertext)
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYP_Decrypt

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput, uint32_t Timeout)

Function description

Decryption mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(plaintext)
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYP_Encrypt_IT

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt_IT (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Encryption in interrupt mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (plaintext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(ciphertext)

Return values

- **HAL:** status

HAL_CRYP_Decrypt_IT

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt_IT (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Decryption in interrupt mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(plaintext)

Return values

- **HAL:** status

HAL_CRYP_Encrypt_DMA

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt_DMA (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Encryption in DMA mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (plaintext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(ciphertext)

Return values

- **HAL:** status

HAL_CRYP_Decrypt_DMA

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt_DMA (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Decryption in DMA mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(plaintext)

Return values

- **HAL:** status

HAL_CRYP_IRQHandler

Function name

void HAL_CRYP_IRQHandler (CRYP_HandleTypeDef * hcryp)

Function description

This function handles cryptographic interrupt request.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_GetState

Function name

HAL_CRYP_STATETypeDef HAL_CRYP_GetState (const CRYP_HandleTypeDef * hcryp)

Function description

Returns the CRYP state.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **HAL:** state

HAL_CRYP_InCpltCallback

Function name

void HAL_CRYP_InCpltCallback (CRYP_HandleTypeDef * hcryp)

Function description

Input FIFO transfer completed callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_OutCpltCallback

Function name

void HAL_CRYP_OutCpltCallback (CRYP_HandleTypeDef * hcryp)

Function description

Output FIFO transfer completed callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_ErrorCallback

Function name

void HAL_CRYP_ErrorCallback (CRYP_HandleTypeDef * hcryp)

Function description

CRYP error callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_GetError

Function name

uint32_t HAL_CRYP_GetError (const CRYP_HandleTypeDef * hcryp)

Function description

Return the CRYP error code.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for the CRYP peripheral

Return values

- **CRYP:** error code

15.3 CRYP Firmware driver defines

The following section lists the various define and macros of the module.

15.3.1 CRYP

CRYP

CRYP Algorithm Mode

CRYP_AES_ECB

Electronic codebook chaining algorithm

CRYP_AES_CBC

Cipher block chaining algorithm

CRYP_AES_CTR

Counter mode chaining algorithm

CRYP_AES_GCM_GMAC

Galois counter mode - Galois message authentication code

CRYP_AES_CCM

Counter with Cipher Mode

CRYP CLEAR Flags

CRYP_CLEAR_CCF

Computation Complete Flag Clear

CRYP_CLEAR_RWEIF

Clear Error Flag : RWEIF in AES_ISR and both RDERR and WRERR flags in AES_SR

CRYP_CLEAR_KEIF

Clear Key Error Flag: KEIF in AES_ISR

CRYP_CLEAR_RNGEIF

Clear rng Error Flag: RNGEIF in AES_ISR

CRYP Key and IV Configuration Skip Mode

CRYP_KEYIVCONFIG_ALWAYS

Peripheral Key and IV configuration to do systematically

CRYP_KEYIVCONFIG_ONCE

Peripheral Key and IV configuration to do only once

CRYP_KEYNOCONFIG

Peripheral Key configuration to not do

CRYP_IVCONFIG_ONCE

Peripheral IV configuration do once for interleave mode

CRYP Data Type

CRYP_DATATYPE_32B

CRYP_DATATYPE_16B

CRYP_DATATYPE_8B

CRYP_DATATYPE_1B

CRYP_NO_SWAP

32-bit data type (no swapping)

CRYP_HALFWORD_SWAP

16-bit data type (half-word swapping)

CRYP_BYTE_SWAP

8-bit data type (byte swapping)

CRYP_BIT_SWAP

1-bit data type (bit swapping)

CRYP Data Width Unit

CRYP_DATAWIDTHUNIT_WORD

By default, size unit is word

CRYP_DATAWIDTHUNIT_BYTE

By default, size unit is byte

CRYP Error Definition

HAL_CRYP_ERROR_NONE

No error

HAL_CRYP_ERROR_WRITE

Write error

HAL_CRYP_ERROR_READ

Read error

HAL_CRYP_ERROR_DMA

DMA error

HAL_CRYP_ERROR_BUSY

Busy flag error

HAL_CRYP_ERROR_TIMEOUT

Timeout error

HAL_CRYP_ERROR_NOT_SUPPORTED

Not supported mode

HAL_CRYP_ERROR_AUTH_TAG_SEQUENCE

Sequence are not respected only for GCM or CCM

HAL_CRYP_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_CRYP_ERROR_KEY

Key error

HAL_CRYP_ERROR_RNG

Rng error

CRYP Exported Macros

__HAL_CRYP_RESET_HANDLE_STATE

Description:

- Reset CRYP handle state.

Parameters:

- __HANDLE__: specifies the CRYP handle.

Return value:

- None

__HAL_CRYP_ENABLE

Description:

- Enable/Disable the CRYP peripheral.

Parameters:

- __HANDLE__: specifies the CRYP handle.

Return value:

- None

__HAL_CRYP_DISABLE

__HAL_CRYP_GET_FLAG

Description:

- Check whether the specified CRYP status flag is set or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values for TinyAES:
  - CRYP_FLAG_KEYVALID Key valid flag
  - CRYP_FLAG_BUSY GCM process suspension forbidden or transferring a shared key from SAES IP.
  - CRYP_FLAG_WRERR Write Error flag
  - CRYP_FLAG_RDERR Read Error flag
  - CRYP_FLAG_CCF Computation Complete flag
  - CRYP_FLAG_KEIF Key error flag
  - CRYP_FLAG_RWEIF Read/write Error flag

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_CRYP_CLEAR_FLAG

Description:

- Clear the CRYP pending status flag.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - CRYP_CLEAR_RWEIF Read (RDERR), Write (WRERR) or Read/write (RWEIF) Error Flag Clear
  - CRYP_CLEAR_CCF Computation Complete Flag (CCF) Clear
  - CRYP_CLEAR_KEIF Key error interrupt flag clear

Return value:

- None

__HAL_CRYP_GET_IT_SOURCE

Description:

- Check whether the specified CRYP interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP interrupt source to check This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt

Return value:

- State: of interruption (TRUE or FALSE).

__HAL_CRYP_ENABLE_IT

Description:

- Enable the CRYP interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP Interrupt. This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt

Return value:

- None

__HAL_CRYP_DISABLE_IT

Description:

- Disable the CRYP interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP Interrupt. This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt

Return value:

- None

CRYP Flags

CRYP_FLAG_BUSY

GCM process suspension forbidden also set when transferring a shared key from SAES peripheral

CRYP_FLAG_WRERR

Write Error flag

CRYP_FLAG_RDERR

Read error flag

CRYP_FLAG_CCF

Computation completed flag as AES_ISR_CCF

CRYP_FLAG_KEYVALID

Key Valid flag

CRYP_FLAG_KEIF

Key error interrupt flag

CRYP_FLAG_RWEIF

Read or write error Interrupt flag

CRYP_FLAG_RNGEIF

RNG error interrupt flag

CRYP Header Width Unit

CRYP_HEADERWIDTHUNIT_WORD

By default, header size unit is word

CRYP_HEADERWIDTHUNIT_BYTE

By default, header size unit is byte

CRYP Interrupt

CRYP_IT_CCFIE

Computation Complete interrupt enable

CRYP_IT_RWEIE

Read or write Error interrupt enable

CRYP_IT_KEIE

Key error interrupt enable

CRYP_IT_RNGEIE

Rng error interrupt enable

CRYP Key Mode

CRYP_KEYMODE_NORMAL

Normal key usage, Key registers are freely usable

CRYP_KEYMODE_SHARED

Shared key

CRYP_KEYMODE_WRAPPED

Only for SAES, Wrapped key: to encrypt or decrypt AES keys

CRYP Key Protection

CRYP_KEYPROT_ENABLE

Only for SAES, Key protection between 2 applications with different security contexts

CRYP_KEYPROT_DISABLE

Only for SAES, Key not protected between 2 applications with different security contexts

CRYP Key Select

CRYP_KEYSEL_NORMAL

Normal key, key registers SAES_KEYx or CRYP_KEYx

CRYP_KEYSEL_HW

Only for SAES, Hardware key : derived hardware unique key (DHUK 256-bit)

CRYP_KEYSEL_SW

Only for SAES, Software key : boot hardware key BHK (256-bit)

CRYP_KEYSEL_HSW

Only for SAES, DHUK XOR BHK Hardware unique key XOR software key

CRYP Key Share ID

CRYP_KSHAREID_AES

Share SAES Key with AES peripheral

CRYP Key Size

CRYP_KEYSIZE_128B

128-bit long key

CRYP_KEYSIZE_256B

256-bit long key

16 HAL CRYP Extension Driver

16.1 CRYPEx Firmware driver API description

The following section lists the various functions of the CRYPEx library.

16.1.1 Extended AES processing functions

This section provides functions allowing to generate the authentication TAG in Polling mode

1. HAL_CRYPEx_AESGCM_GenerateAuthTAG
2. HAL_CRYPEx_AESCCM_GenerateAuthTAG they should be used after Encrypt/Decrypt operation.

This section contains the following APIs:

- ***HAL_CRYPEx_AESGCM_GenerateAuthTAG()***
- ***HAL_CRYPEx_AESCCM_GenerateAuthTAG()***

16.1.2 Wrap and Unwrap key

This section provides API allowing to wrap (encrypt) and unwrap (decrypt) key using one of the following keys, and AES Algorithm. Key selection : - Derived hardware unique key (DHUK) - XOR of DHUK and BHK - Boot hardware key (BHK)

This section contains the following APIs:

- ***HAL_CRYPEx_WrapKey()***
- ***HAL_CRYPEx_UnwrapKey()***

16.1.3 Encrypt and Decrypt Shared key functions

This section provides API allowing to Encrypt and Decrypt Shared key

This section contains the following APIs:

- ***HAL_CRYPEx_EncryptSharedKey()***
- ***HAL_CRYPEx_DecryptSharedKey()***

16.1.4 Detailed description of functions

HAL_CRYPEx_AESGCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESGCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, const uint32_t * pAuthTag, uint32_t Timeout)

Function description

generate the GCM authentication TAG.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pAuthTag:** Pointer to the authentication buffer the pAuthTag generated here is 128bits length, if the TAG length is less than 128bits, user should consider only the valid part of pAuthTag buffer which correspond exactly to TAG length.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_CRYPEx_AESCCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESCCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, const uint32_t * pAuthTag, uint32_t Timeout)

Function description

AES CCM Authentication TAG generation.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pAuthTag:** Pointer to the authentication buffer the pAuthTag generated here is 128bits length, if the TAG length is less than 128bits, user should consider only the valid part of pAuthTag buffer which correspond exactly to TAG length.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_CRYPEx_UnwrapKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_UnwrapKey (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint32_t Timeout)

Function description

Unwrap (Decrypt) application keys.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the Key buffer to decrypt or generated key in case of CTR.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYPEx_WrapKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_WrapKey (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint32_t * pOutput, uint32_t Timeout)

Function description

Wrap (encrypt) application keys.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the Key buffer to encrypt in case of ECB or CBC
- **pOutput:** Pointer to the Key buffer encrypted in case of ECB or CBC
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYPEx_EncryptSharedKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_EncryptSharedKey (CRYP_HandleTypeDef * hcryp, uint32_t * pKey, uint32_t * pOutput, uint32_t ID, uint32_t Timeout)

Function description

Encrypt Shared key.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pKey:** Pointer to the Key buffer to share
- **pOutput:** Pointer to the Key buffer encrypted
- **ID:** Key share identification
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYPEx_DecryptSharedKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_DecryptSharedKey (CRYP_HandleTypeDef * hcryp, uint32_t * pKey, uint32_t ID, uint32_t Timeout)

Function description

Decrypt Shared key.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pKey:** Pointer to the Key buffer to share
- **ID:** Key share identification
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

17 HAL DAC Generic Driver

17.1 DAC Firmware driver registers structures

17.1.1 __DAC_HandleTypeDef

__DAC_HandleTypeDef is defined in the stm32h5xx_hal_dac.h

Data Fields

- ***DAC_TypeDef * Instance***
- ***__IO HAL_DAC_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***DMA_HandleTypeDef * DMA_Handle1***
- ***DMA_HandleTypeDef * DMA_Handle2***
- ***__IO uint32_t ErrorCode***
- ***void(* ConvCpltCallbackCh1***
- ***void(* ConvHalfCpltCallbackCh1***
- ***void(* ErrorCallbackCh1***
- ***void(* DMAUnderrunCallbackCh1***
- ***void(* ConvCpltCallbackCh2***
- ***void(* ConvHalfCpltCallbackCh2***
- ***void(* ErrorCallbackCh2***
- ***void(* DMAUnderrunCallbackCh2***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DAC_TypeDef* __DAC_HandleTypeDef::Instance***
  Register base address
- ***__IO HAL_DAC_StateTypeDef __DAC_HandleTypeDef::State***
  DAC communication state
- ***HAL_LockTypeDef __DAC_HandleTypeDef::Lock***
  DAC locking object
- ***DMA_HandleTypeDef* __DAC_HandleTypeDef::DMA_Handle1***
  Pointer DMA handler for channel 1
- ***DMA_HandleTypeDef* __DAC_HandleTypeDef::DMA_Handle2***
  Pointer DMA handler for channel 2
- ***__IO uint32_t __DAC_HandleTypeDef::ErrorCode***
  DAC Error code
- ***void(* __DAC_HandleTypeDef::ConvCpltCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ConvHalfCpltCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ErrorCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::DMAUnderrunCallbackCh1)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ConvCpltCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ConvHalfCpltCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::ErrorCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::DMAUnderrunCallbackCh2)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::MspInitCallback)(struct __DAC_HandleTypeDef *hdac)***
- ***void(* __DAC_HandleTypeDef::MspDeInitCallback)(struct __DAC_HandleTypeDef *hdac)***

17.1.2 DAC_SampleAndHoldConfTypeDef

DAC_SampleAndHoldConfTypeDef is defined in the stm32h5xx_hal_dac.h

Data Fields

- ***uint32_t DAC_SampleTime***
- ***uint32_t DAC_HoldTime***
- ***uint32_t DAC_RefreshTime***

Field Documentation

- ***uint32_t DAC_SampleAndHoldConfTypeDef::DAC_SampleTime***
  Specifies the Sample time for the selected channel. This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 1023
- ***uint32_t DAC_SampleAndHoldConfTypeDef::DAC_HoldTime***
  Specifies the hold time for the selected channel This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 1023
- ***uint32_t DAC_SampleAndHoldConfTypeDef::DAC_RefreshTime***
  Specifies the refresh time for the selected channel This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 255

17.1.3 DAC_ChannelConfTypeDef

DAC_ChannelConfTypeDef is defined in the stm32h5xx_hal_dac.h

Data Fields

- ***uint32_t DAC_HighFrequency***
- ***FunctionalState DAC_DMADoubleDataMode***
- ***FunctionalState DAC_SignedFormat***
- ***uint32_t DAC_SampleAndHold***
- ***uint32_t DAC_Trigger***
- ***uint32_t DAC_OutputBuffer***
- ***uint32_t DAC_ConnectOnChipPeripheral***
- ***uint32_t DAC_UserTrimming***
- ***uint32_t DAC_TrimmingValue***
- ***DAC_SampleAndHoldConfTypeDef DAC_SampleAndHoldConfig***

Field Documentation

- ***uint32_t DAC_ChannelConfTypeDef::DAC_HighFrequency***
  Specifies the frequency interface mode This parameter can be a value of ***DAC_HighFrequency***
- ***FunctionalState DAC_ChannelConfTypeDef::DAC_DMADoubleDataMode***
  Specifies if DMA double data mode should be enabled or not for the selected channel. This parameter can be ENABLE or DISABLE
- ***FunctionalState DAC_ChannelConfTypeDef::DAC_SignedFormat***
  Specifies if signed format should be used or not for the selected channel. This parameter can be ENABLE or DISABLE
- ***uint32_t DAC_ChannelConfTypeDef::DAC_SampleAndHold***
  Specifies whether the DAC mode. This parameter can be a value of ***DAC_SampleAndHold***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_Trigger***
  Specifies the external trigger for the selected DAC channel. This parameter can be a value of ***DAC_trigger_selection***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_OutputBuffer***
  Specifies whether the DAC channel output buffer is enabled or disabled. This parameter can be a value of ***DAC_output_buffer***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_ConnectOnChipPeripheral***
  Specifies whether the DAC output is connected or not to on chip peripheral. This parameter can be a value of ***DAC_ConnectOnChipPeripheral***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_UserTrimming***
  Specifies the trimming mode This parameter must be a value of ***DAC_UserTrimming*** DAC_UserTrimming is either factory or user trimming

- ***uint32_t DAC_ChannelConfTypeDef::DAC_TrimmingValue***
  Specifies the offset trimming value i.e. when DAC_SampleAndHold is DAC_TRIMMING_USER. This parameter must be a number between Min_Data = 1 and Max_Data = 31
- ***DAC_SampleAndHoldConfTypeDef DAC_ChannelConfTypeDef::DAC_SampleAndHoldConfig***
  Sample and Hold settings

17.2 DAC Firmware driver API description

The following section lists the various functions of the DAC library.

17.2.1 DAC Peripheral features

DAC Channels

STM32H5 devices integrate two 12-bit Digital Analog Converters The 2 converters (i.e. channel1 & channel2) can be used independently or simultaneously (dual mode):

1. DAC channel1 with DAC_OUT1 (PA4) as output or connected to on-chip peripherals (ex. ADC).
2. DAC channel2 with DAC_OUT2 (PA5) as output or connected to on-chip peripherals (ex. ADC).

DAC Triggers

Digital to Analog conversion can be non-triggered using DAC_TRIGGER_NONE and DAC_OUT1/DAC_OUT2 is available once writing to DHRx register.

Digital to Analog conversion can be triggered by:

1. External event: EXTI Line 9 (any GPIOx_PIN_9) using DAC_TRIGGER_EXT_IT9. The used pin (GPIOx_PIN_9) must be configured in input mode.
2. Timers TRGO: TIM1, TIM2, TIM3, TIM4, TIM5, TIM6, TIM7, TIM8 and TIM15 (DAC_TRIGGER_T1_TRGO, DAC_TRIGGER_T2_TRGO...)
3. Low Power Timers CH1: LPTIM1 and LPTIM2 (DAC_TRIGGER_LPTIM1_CH1, DAC_TRIGGER_LPTIM2_CH1)
4. Software using DAC_TRIGGER_SOFTWARE

The trigger selection depends on the PWR mode: in stop0, stop1 and stop2 we should select DAC_TRIGGER_EXT_IT9, DAC_TRIGGER_LPTIM1_CH1 or DAC_TRIGGER_LPTIM2_CH1.The other triggers are not functional.

DAC Buffer mode feature

Each DAC channel integrates an output buffer that can be used to reduce the output impedance, and to drive external loads directly without having to add an external operational amplifier. To enable, the output buffer use sConfig.DAC_OutputBuffer = DAC_OUTPUTBUFFER_ENABLE;

Note: Refer to the device datasheet for more details about output impedance value with and without output buffer.

GPIO configurations guidelines

When a DAC channel is used (ex channel1 on PA4) and the other is not (ex channel2 on PA5 is configured in Analog and disabled). Channel1 may disturb channel2 as coupling effect. Note that there is no coupling on channel2 as soon as channel2 is turned on. Coupling on adjacent channel could be avoided as follows: when unused PA5 is configured as INPUT PULL-UP or DOWN. PA5 is configured in ANALOG just before it is turned on.

DAC Sample and Hold feature

For each converter, 2 modes are supported: normal mode and "sample and hold" mode (i.e. low power mode). In the sample and hold mode, the DAC core converts data, then holds the converted voltage on a capacitor. When not converting, the DAC cores and buffer are completely turned off between samples and the DAC output is tri-stated, therefore reducing the overall power consumption. A new stabilization period is needed before each new conversion. The sample and hold allow setting internal or external voltage @ low power consumption cost (output value can be at any given rate either by CPU or DMA). The Sample and hold block and registers uses either LSI & run in several power modes: run mode, sleep mode, low power run, low power sleep mode & stop1 mode. Low power stop1 mode allows only static conversion. To enable Sample and Hold mode Enable LSI using HAL_RCC_OscConfig with RCC_OSCILLATORTYPE_LSI & RCC_LSI_ON parameters. Use DAC_InitStructure.DAC_SampleAndHold = DAC_SAMPLEANDHOLD_ENABLE; & DAC_ChannelConfTypeDef.DAC_SampleAndHoldConfig.DAC_SampleTime, DAC_HoldTime & DAC_RefreshTime;

DAC calibration feature

1. The 2 converters (channel1 & channel2) provide calibration capabilities.
   - Calibration aims at correcting some offset of output buffer.
   - The DAC uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
   - The user defined settings can be figured out using self calibration handled by HAL_DACEx_SelfCalibrate.
   - HAL_DACEx_SelfCalibrate:
     - Runs automatically the calibration.
     - Enables the user trimming mode
     - Updates a structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)

DAC wave generation feature

Both DAC channels can be used to generate

1. Noise wave
2. Triangle wave

DAC data format

The DAC data format can be:

1. 8-bit right alignment using DAC_ALIGN_8B_R
2. 12-bit left alignment using DAC_ALIGN_12B_L
3. 12-bit right alignment using DAC_ALIGN_12B_R

DAC data value to voltage correspondence

The analog output voltage on each DAC channel pin is determined by the following equation:

DAC_OUTx = VREF+ * DOR / 4095

- with DOR is the Data Output Register

VREF+ is the input voltage reference (refer to the device datasheet)

e.g. To set DAC_OUT1 to 0.7V, use

- Assuming that VREF+ = 3.3V, DAC_OUT1 = (3.3 * 868) / 4095 = 0.7V

DMA requests

A DMA request can be generated when an external trigger (but not a software trigger) occurs if DMA requests are enabled using HAL_DAC_Start_DMA(). DMA requests are mapped as following: GPDMA requests are mapped as following:

- DAC channel1 mapped on GPDMA request 2 (can be any GPDMA channel)

- DAC channel2 mapped on GPDMA request 3 (can be any GPDMA channel)

High frequency interface mode

The high frequency interface informs DAC instance about the bus frequency in use. It is mandatory information for DAC (as internal timing of DAC is bus frequency dependent) provided thanks to parameter DAC_HighFrequency handled in HAL_DAC_ConfigChannel () function. Use of DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC value of DAC_HighFrequency is recommended function figured out the correct setting. The high frequency mode is same for all converters of a same DAC instance. Either same parameter DAC_HighFrequency is used for all DAC converters or again self DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC detection parameter.

Note: For Dual mode and specific signal (Triangle and noise) generation please refer to Extended Features Driver description

17.2.2 How to use this driver

- DAC APB clock must be enabled to get write access to DAC registers using HAL_DAC_Init()
- Configure DAC_OUTx (DAC_OUT1: PA4, DAC_OUT2: PA5) in analog mode.
- Configure the DAC channel using HAL_DAC_ConfigChannel() function.
- Enable the DAC channel using HAL_DAC_Start() or HAL_DAC_Start_DMA() functions.

Calibration mode IO operation

- Retrieve the factory trimming (calibration settings) using HAL_DACEx_GetTrimOffset()
- Run the calibration using HAL_DACEx_SelfCalibrate()
- Update the trimming while DAC running using HAL_DACEx_SetUserTrimming()

Polling mode IO operation

- Start the DAC peripheral using HAL_DAC_Start()
- To read the DAC last data output value, use the HAL_DAC_GetValue() function.
- Stop the DAC peripheral using HAL_DAC_Stop()

DMA mode IO operation

- Start the DAC peripheral using HAL_DAC_Start_DMA(), at this stage the user specify the length of data to be transferred at each end of conversion First issued trigger will start the conversion of the value previously set by HAL_DAC_SetValue().
- At the middle of data transfer HAL_DAC_ConvHalfCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_ConvHalfCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2()
- At The end of data transfer HAL_DAC_ConvCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_ConvCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2()
- In case of transfer Error, HAL_DAC_ErrorCallbackCh1() function is executed and user can add his own code by customization of function pointer HAL_DAC_ErrorCallbackCh1
- In case of DMA underrun, DAC interruption triggers and execute internal function HAL_DAC_IRQHandler. HAL_DAC_DMAUnderrunCallbackCh1() or HAL_DACEx_DMAUnderrunCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_DMAUnderrunCallbackCh1() or HAL_DACEx_DMAUnderrunCallbackCh2() and add his own code by customization of function pointer HAL_DAC_ErrorCallbackCh1()
- Stop the DAC peripheral using HAL_DAC_Stop_DMA()

Callback registration

The compilation define USE_HAL_DAC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_DAC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- ConvCpltCallbackCh1 : callback when a half transfer is completed on Ch1.
- ConvHalfCpltCallbackCh1 : callback when a transfer is completed on Ch1.
- ErrorCallbackCh1 : callback when an error occurs on Ch1.
- DMAUnderrunCallbackCh1 : callback when an underrun error occurs on Ch1.
- ConvCpltCallbackCh2 : callback when a half transfer is completed on Ch2.
- ConvHalfCpltCallbackCh2 : callback when a transfer is completed on Ch2.
- ErrorCallbackCh2 : callback when an error occurs on Ch2.
- DMAUnderrunCallbackCh2 : callback when an underrun error occurs on Ch2.
- MspInitCallback : DAC MspInit.
- MspDeInitCallback : DAC MspdeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_DAC_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- ConvCpltCallbackCh1 : callback when a half transfer is completed on Ch1.
- ConvHalfCpltCallbackCh1 : callback when a transfer is completed on Ch1.
- ErrorCallbackCh1 : callback when an error occurs on Ch1.
- DMAUnderrunCallbackCh1 : callback when an underrun error occurs on Ch1.
- ConvCpltCallbackCh2 : callback when a half transfer is completed on Ch2.
- ConvHalfCpltCallbackCh2 : callback when a transfer is completed on Ch2.
- ErrorCallbackCh2 : callback when an error occurs on Ch2.
- DMAUnderrunCallbackCh2 : callback when an underrun error occurs on Ch2.
- MspInitCallback : DAC MspInit.
- MspDeInitCallback : DAC MspdeInit.
- All Callbacks This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_DAC_Init and if the state is HAL_DAC_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_DAC_Init and HAL_DAC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_DAC_Init and HAL_DAC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DAC_RegisterCallback before calling HAL_DAC_DeInit or HAL_DAC_Init function. When The compilation define USE_HAL_DAC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

DAC HAL driver macros list

Below the list of most used macros in DAC HAL driver.

- __HAL_DAC_ENABLE : Enable the DAC peripheral
- __HAL_DAC_DISABLE : Disable the DAC peripheral
- __HAL_DAC_CLEAR_FLAG: Clear the DAC's pending flags
- __HAL_DAC_GET_FLAG: Get the selected DAC's flag status

Note: You can refer to the DAC HAL driver header file for more useful macros

17.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the DAC.
- De-initialize the DAC.

This section contains the following APIs:

- ***HAL_DAC_Init()***
- ***HAL_DAC_DeInit()***
- ***HAL_DAC_MspInit()***

- *HAL_DAC_MspDeInit()*
- *HAL_DAC_RegisterCallback()*
- *HAL_DAC_UnRegisterCallback()*

17.2.4 IO operation functions

This section provides functions allowing to:

- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.
- Stop conversion and disable DMA transfer.
- Get result of conversion.

This section contains the following APIs:

- *HAL_DAC_Start()*
- *HAL_DAC_Stop()*
- *HAL_DAC_Start_DMA()*
- *HAL_DAC_Stop_DMA()*
- *HAL_DAC_IRQHandler()*
- *HAL_DAC_SetValue()*
- *HAL_DAC_ConvCpltCallbackCh1()*
- *HAL_DAC_ConvHalfCpltCallbackCh1()*
- *HAL_DAC_ErrorCallbackCh1()*
- *HAL_DAC_DMAUnderrunCallbackCh1()*
- *HAL_DAC_RegisterCallback()*
- *HAL_DAC_UnRegisterCallback()*

17.2.5 Peripheral Control functions

This section provides functions allowing to:

- Configure channels.
- Set the specified data holding register value for DAC channel.

This section contains the following APIs:

- *HAL_DAC_GetValue()*
- *HAL_DAC_ConfigChannel()*

17.2.6 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the DAC state.
- Check the DAC Errors.

This section contains the following APIs:

- *HAL_DAC_GetState()*
- *HAL_DAC_GetError()*

17.2.7 Detailed description of functions

HAL_DAC_Init

Function name

HAL_StatusTypeDef HAL_DAC_Init (DAC_HandleTypeDef * hdac)

Function description

Initialize the DAC peripheral according to the specified parameters in the DAC_InitStruct and initialize the associated handle.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DAC_DeInit

Function name

HAL_StatusTypeDef HAL_DAC_DeInit (DAC_HandleTypeDef * hdac)

Function description

Deinitialize the DAC peripheral registers to their default reset values.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DAC_MspInit

Function name

void HAL_DAC_MspInit (DAC_HandleTypeDef * hdac)

Function description

Initialize the DAC MSP.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_MspDeInit

Function name

void HAL_DAC_MspDeInit (DAC_HandleTypeDef * hdac)

Function description

DeInitialize the DAC MSP.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_Start

Function name

HAL_StatusTypeDef HAL_DAC_Start (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Enables DAC and starts conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_Stop

Function name

HAL_StatusTypeDef HAL_DAC_Stop (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_Start_DMA

Function name

HAL_StatusTypeDef HAL_DAC_Start_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel, const uint32_t * pData, uint32_t Length, uint32_t Alignment)

Function description

Enables DAC and starts conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **pData:** The source Buffer address.
- **Length:** The length of data to be transferred from memory to DAC peripheral
- **Alignment:** Specifies the data alignment for DAC channel. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected

Return values

- **HAL:** status

HAL_DAC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_DAC_Stop_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_IRQHandler

Function name

void HAL_DAC_IRQHandler (DAC_HandleTypeDef * hdac)

Function description

Handles DAC interrupt request This function uses the interruption of DMA underrun.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_SetValue

Function name

HAL_StatusTypeDef HAL_DAC_SetValue (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Alignment, uint32_t Data)

Function description

Set the specified data holding register value for DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Alignment:** Specifies the data alignment. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected
- **Data:** Data to be loaded in the selected data holding register.

Return values

- **HAL:** status

HAL_DAC_ConvCpltCallbackCh1

Function name

void HAL_DAC_ConvCpltCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Conversion complete callback in non-blocking mode for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_ConvHalfCpltCallbackCh1

Function name

void HAL_DAC_ConvHalfCpltCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Conversion half DMA transfer callback in non-blocking mode for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_ErrorCallbackCh1

Function name

void HAL_DAC_ErrorCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Error DAC callback for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_DMAUnderrunCallbackCh1

Function name

void HAL_DAC_DMAUnderrunCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

DMA underrun DAC callback for channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DAC_RegisterCallback (DAC_HandleTypeDef * hdac, HAL_DAC_CallbackIDTypeDef CallbackID, pDAC_CallbackTypeDef pCallback)

Function description

Register a User DAC Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hdac:** DAC handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DAC_ERROR_INVALID_CALLBACK DAC Error Callback ID
  - HAL_DAC_CH1_COMPLETE_CB_ID DAC CH1 Complete Callback ID
  - HAL_DAC_CH1_HALF_COMPLETE_CB_ID DAC CH1 Half Complete Callback ID
  - HAL_DAC_CH1_ERROR_ID DAC CH1 Error Callback ID
  - HAL_DAC_CH1_UNDERRUN_CB_ID DAC CH1 UnderRun Callback ID
  - HAL_DAC_CH2_COMPLETE_CB_ID DAC CH2 Complete Callback ID
  - HAL_DAC_CH2_HALF_COMPLETE_CB_ID DAC CH2 Half Complete Callback ID
  - HAL_DAC_CH2_ERROR_ID DAC CH2 Error Callback ID
  - HAL_DAC_CH2_UNDERRUN_CB_ID DAC CH2 UnderRun Callback ID
  - HAL_DAC_MSPINIT_CB_ID DAC MSP Init Callback ID
  - HAL_DAC_MSPDEINIT_CB_ID DAC MSP DeInit Callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

Notes

- The HAL_DAC_RegisterCallback() may be called before HAL_DAC_Init() in HAL_DAC_STATE_RESET to register callbacks for HAL_DAC_MSPINIT_CB_ID and HAL_DAC_MSPDEINIT_CB_ID

HAL_DAC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DAC_UnRegisterCallback (DAC_HandleTypeDef * hdac, HAL_DAC_CallbackIDTypeDef CallbackID)

Function description

Unregister a User DAC Callback DAC Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hdac:** DAC handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_DAC_CH1_COMPLETE_CB_ID DAC CH1 transfer Complete Callback ID
  - HAL_DAC_CH1_HALF_COMPLETE_CB_ID DAC CH1 Half Complete Callback ID
  - HAL_DAC_CH1_ERROR_ID DAC CH1 Error Callback ID
  - HAL_DAC_CH1_UNDERRUN_CB_ID DAC CH1 UnderRun Callback ID
  - HAL_DAC_CH2_COMPLETE_CB_ID DAC CH2 Complete Callback ID
  - HAL_DAC_CH2_HALF_COMPLETE_CB_ID DAC CH2 Half Complete Callback ID
  - HAL_DAC_CH2_ERROR_ID DAC CH2 Error Callback ID
  - HAL_DAC_CH2_UNDERRUN_CB_ID DAC CH2 UnderRun Callback ID
  - HAL_DAC_MSPINIT_CB_ID DAC MSP Init Callback ID
  - HAL_DAC_MSPDEINIT_CB_ID DAC MSP DeInit Callback ID
  - HAL_DAC_ALL_CB_ID DAC All callbacks

Return values

- **status:**

Notes

- The HAL_DAC_UnRegisterCallback() may be called before HAL_DAC_Init() in HAL_DAC_STATE_RESET to un-register callbacks for HAL_DAC_MSPINIT_CB_ID and HAL_DAC_MSPDEINIT_CB_ID

HAL_DAC_GetValue

Function name

uint32_t HAL_DAC_GetValue (const DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Returns the last data output value of the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **The:** selected DAC channel data output value.

HAL_DAC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_DAC_ConfigChannel (DAC_HandleTypeDef * hdac, const DAC_ChannelConfTypeDef * sConfig, uint32_t Channel)

Function description

Configures the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC configuration structure.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

Notes

- By calling this function, the high frequency interface mode (HFSEL bits) will be set. This parameter scope is the DAC instance. As the function is called for each channel, the DAC high frequency interface mode of sConfig must be the same at each call. (or DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC self detect).

HAL_DAC_GetState

Function name

HAL_DAC_StateTypeDef HAL_DAC_GetState (const DAC_HandleTypeDef * hdac)

Function description

return the DAC handle state

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** state

HAL_DAC_GetError

Function name

uint32_t HAL_DAC_GetError (const DAC_HandleTypeDef * hdac)

Function description

Return the DAC error code.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **DAC:** Error Code

DAC_DMAConvCpltCh1

Function name

void DAC_DMAConvCpltCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA conversion complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAErrorCh1

Function name

void DAC_DMAErrorCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAHalfConvCpltCh1

Function name

void DAC_DMAHalfConvCpltCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

17.3 DAC Firmware driver defines

The following section lists the various define and macros of the module.

17.3.1 DAC

DAC

DAC Channel selection

DAC_CHANNEL_1

DAC_CHANNEL_2

DAC ConnectOnChipPeripheral

DAC_CHIPCONNECT_EXTERNAL

DAC_CHIPCONNECT_INTERNAL

DAC_CHIPCONNECT_BOTH

DAC data alignment

DAC_ALIGN_12B_R

DAC_ALIGN_12B_L

DAC_ALIGN_8B_R

DAC Error Code

HAL_DAC_ERROR_NONE

No error

HAL_DAC_ERROR_DMAUNDERRUNCH1

DAC channel1 DMA underrun error

HAL_DAC_ERROR_DMAUNDERRUNCH2

DAC channel2 DMA underrun error

HAL_DAC_ERROR_DMA

DMA error

HAL_DAC_ERROR_TIMEOUT

Timeout error

HAL_DAC_ERROR_INVALID_CALLBACK

Invalid callback error

HAL_DAC_ERROR_INVALID_CONFIG

Invalid configuration error

DAC Exported Macros

__HAL_DAC_RESET_HANDLE_STATE

Description:

- Reset DAC handle state.

Parameters:

- __HANDLE__: specifies the DAC handle.

Return value:

- None

__HAL_DAC_ENABLE

Description:

- Enable the DAC channel.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __DAC_Channel__: specifies the DAC channel

Return value:

- None

__HAL_DAC_DISABLE

Description:

- Disable the DAC channel.

Parameters:

- __HANDLE__: specifies the DAC handle
- __DAC_Channel__: specifies the DAC channel.

Return value:

- None

DAC_DHR12R1_ALIGNMENT

Description:

- Set DHR12R1 alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

DAC_DHR12R2_ALIGNMENT

Description:

- Set DHR12R2 alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

DAC_DHR12RD_ALIGNMENT

Description:

- Set DHR12RD alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

__HAL_DAC_ENABLE_IT

Description:

- Enable the DAC interrupt.

Parameters:

- __HANDLE__: specifies the DAC handle
- __INTERRUPT__: specifies the DAC interrupt. This parameter can be any combination of the following values:
  - DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  - DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- None

__HAL_DAC_DISABLE_IT

Description:

- Disable the DAC interrupt.

Parameters:

- __HANDLE__: specifies the DAC handle
- __INTERRUPT__: specifies the DAC interrupt. This parameter can be any combination of the following values:
  - DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  - DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- None

__HAL_DAC_GET_IT_SOURCE

Description:

- Check whether the specified DAC interrupt source is enabled or not.

Parameters:

- __HANDLE__: DAC handle
- __INTERRUPT__: DAC interrupt source to check This parameter can be any combination of the following values:
  - DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  - DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- State: of interruption (SET or RESET)

__HAL_DAC_GET_FLAG

Description:

- Get the selected DAC's flag status.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __FLAG__: specifies the DAC flag to get. This parameter can be any combination of the following values:
  - DAC_FLAG_DMAUDR1 DAC channel 1 DMA underrun flag
  - DAC_FLAG_DMAUDR2 DAC channel 2 DMA underrun flag
  - DAC_FLAG_DAC1RDY DAC channel 1 ready status flag
  - DAC_FLAG_DAC2RDY DAC channel 2 ready status flag

Return value:

- None

__HAL_DAC_CLEAR_FLAG

Description:

- Clear the DAC's flag.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __FLAG__: specifies the DAC flag to clear. This parameter can be any combination of the following values:
  - DAC_FLAG_DMAUDR1 DAC channel 1 DMA underrun flag
  - DAC_FLAG_DMAUDR2 DAC channel 2 DMA underrun flag

Return value:

- None

DAC flags definition

DAC_FLAG_DMAUDR1

DAC_FLAG_DMAUDR2

DAC_FLAG_DAC1RDY

DAC_FLAG_DAC2RDY

DAC high frequency interface mode

DAC_HIGH_FREQUENCY_INTERFACE_MODE_DISABLE

High frequency interface mode disabled

DAC_HIGH_FREQUENCY_INTERFACE_MODE_ABOVE_80MHZ

High frequency interface mode compatible to AHB>80MHz enabled

DAC_HIGH_FREQUENCY_INTERFACE_MODE_ABOVE_160MHZ

High frequency interface mode compatible to AHB>160MHz enabled

DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC

High frequency interface mode automatic

18 HAL DAC Extension Driver

18.1 DACEx Firmware driver API description

The following section lists the various functions of the DACEx library.

18.1.1 How to use this driver

Dual mode IO operation

- Use HAL_DACEx_DualStart() to enable both channel and start conversion for dual mode operation. If software trigger is selected, using HAL_DACEx_DualStart() will start the conversion of the value previously set by HAL_DACEx_DualSetValue().
- Use HAL_DACEx_DualStop() to disable both channel and stop conversion for dual mode operation.
- Use HAL_DACEx_DualStart_DMA() to enable both channel and start conversion for dual mode operation using DMA to feed DAC converters. First issued trigger will start the conversion of the value previously set by HAL_DACEx_DualSetValue(). The same callbacks that are used in single mode are called in dual mode to notify transfer completion (half complete or complete), errors or underrun.
- Use HAL_DACEx_DualStop_DMA() to disable both channel and stop conversion for dual mode operation using DMA to feed DAC converters.
- When Dual mode is enabled (i.e. DAC Channel1 and Channel2 are used simultaneously) : Use HAL_DACEx_DualGetValue() to get digital data to be converted and use HAL_DACEx_DualSetValue() to set digital value to converted simultaneously in Channel 1 and Channel 2.

Signal generation operation

- Use HAL_DACEx_TriangleWaveGenerate() to generate Triangle signal.
- Use HAL_DACEx_NoiseWaveGenerate() to generate Noise signal.
- HAL_DACEx_SelfCalibrate to calibrate one DAC channel.
- HAL_DACEx_SetUserTrimming to set user trimming value.
- HAL_DACEx_GetTrimOffset to retrieve trimming value (factory setting after reset, user setting if HAL_DACEx_SetUserTrimming have been used at least one time after reset).

18.1.2 Extended features functions

This section provides functions allowing to:

- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.
- Stop conversion and disable DMA transfer.
- Get result of conversion.
- Get result of dual mode conversion.

This section contains the following APIs:

- ***HAL_DACEx_DualStart()***
- ***HAL_DACEx_DualStop()***
- ***HAL_DACEx_DualStart_DMA()***
- ***HAL_DACEx_DualStop_DMA()***
- ***HAL_DACEx_TriangleWaveGenerate()***
- ***HAL_DACEx_NoiseWaveGenerate()***
- ***HAL_DACEx_DualSetValue()***
- ***HAL_DACEx_ConvCpltCallbackCh2()***
- ***HAL_DACEx_ConvHalfCpltCallbackCh2()***
- ***HAL_DACEx_ErrorCallbackCh2()***

- *HAL_DACEx_DMAUnderrunCallbackCh2()*
- *HAL_DACEx_SelfCalibrate()*
- *HAL_DACEx_SetUserTrimming()*
- *HAL_DACEx_GetTrimOffset()*
- *HAL_DACEx_DualGetValue()*

18.1.3 Peripheral Control functions

This section provides functions allowing to:

- Set the specified data holding register value for DAC channel.

This section contains the following APIs:

- *HAL_DACEx_DualGetValue()*
- *HAL_DACEx_SelfCalibrate()*
- *HAL_DACEx_SetUserTrimming()*
- *HAL_DACEx_GetTrimOffset()*

18.1.4 Detailed description of functions

HAL_DACEx_TriangleWaveGenerate

Function name

HAL_StatusTypeDef HAL_DACEx_TriangleWaveGenerate (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Amplitude)

Function description

Enable or disable the selected DAC channel wave generation.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Amplitude:** Select max triangle amplitude. This parameter can be one of the following values:
  - DAC_TRIANGLEAMPLITUDE_1: Select max triangle amplitude of 1
  - DAC_TRIANGLEAMPLITUDE_3: Select max triangle amplitude of 3
  - DAC_TRIANGLEAMPLITUDE_7: Select max triangle amplitude of 7
  - DAC_TRIANGLEAMPLITUDE_15: Select max triangle amplitude of 15
  - DAC_TRIANGLEAMPLITUDE_31: Select max triangle amplitude of 31
  - DAC_TRIANGLEAMPLITUDE_63: Select max triangle amplitude of 63
  - DAC_TRIANGLEAMPLITUDE_127: Select max triangle amplitude of 127
  - DAC_TRIANGLEAMPLITUDE_255: Select max triangle amplitude of 255
  - DAC_TRIANGLEAMPLITUDE_511: Select max triangle amplitude of 511
  - DAC_TRIANGLEAMPLITUDE_1023: Select max triangle amplitude of 1023
  - DAC_TRIANGLEAMPLITUDE_2047: Select max triangle amplitude of 2047
  - DAC_TRIANGLEAMPLITUDE_4095: Select max triangle amplitude of 4095

Return values

- **HAL:** status

HAL_DACEx_NoiseWaveGenerate

Function name

HAL_StatusTypeDef HAL_DACEx_NoiseWaveGenerate (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Amplitude)

Function description

Enable or disable the selected DAC channel wave generation.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Amplitude:** Unmask DAC channel LFSR for noise wave generation. This parameter can be one of the following values:
  - DAC_LFSRUNMASK_BIT0: Unmask DAC channel LFSR bit0 for noise wave generation
  - DAC_LFSRUNMASK_BITS1_0: Unmask DAC channel LFSR bit[1:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS2_0: Unmask DAC channel LFSR bit[2:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS3_0: Unmask DAC channel LFSR bit[3:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS4_0: Unmask DAC channel LFSR bit[4:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS5_0: Unmask DAC channel LFSR bit[5:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS6_0: Unmask DAC channel LFSR bit[6:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS7_0: Unmask DAC channel LFSR bit[7:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS8_0: Unmask DAC channel LFSR bit[8:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS9_0: Unmask DAC channel LFSR bit[9:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS10_0: Unmask DAC channel LFSR bit[10:0] for noise wave generation
  - DAC_LFSRUNMASK_BITS11_0: Unmask DAC channel LFSR bit[11:0] for noise wave generation

Return values

- **HAL:** status

HAL_DACEx_DualStart

Function name

HAL_StatusTypeDef HAL_DACEx_DualStart (DAC_HandleTypeDef * hdac)

Function description

Enables DAC and starts conversion of both channels.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DACEx_DualStop

Function name

HAL_StatusTypeDef HAL_DACEx_DualStop (DAC_HandleTypeDef * hdac)

Function description

Disables DAC and stop conversion of both channels.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DACEx_DualStart_DMA

Function name

HAL_StatusTypeDef HAL_DACEx_DualStart_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel, const uint32_t * pData, uint32_t Length, uint32_t Alignment)

Function description

Enables DAC and starts conversion of both channel 1 and 2 of the same DAC.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The DAC channel that will request data from DMA. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **pData:** The destination peripheral Buffer address.
- **Length:** The length of data to be transferred from memory to DAC peripheral
- **Alignment:** Specifies the data alignment for DAC channel. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected

Return values

- **HAL:** status

HAL_DACEx_DualStop_DMA

Function name

HAL_StatusTypeDef HAL_DACEx_DualStop_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion both channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The DAC channel that requests data from DMA. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DACEx_DualSetValue

Function name

HAL_StatusTypeDef HAL_DACEx_DualSetValue (DAC_HandleTypeDef * hdac, uint32_t Alignment, uint32_t Data1, uint32_t Data2)

Function description

Set the specified data holding register value for dual DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Alignment:** Specifies the data alignment for dual channel DAC. This parameter can be one of the following values: DAC_ALIGN_8B_R: 8bit right data alignment selected DAC_ALIGN_12B_L: 12bit left data alignment selected DAC_ALIGN_12B_R: 12bit right data alignment selected
- **Data1:** Data for DAC Channel1 to be loaded in the selected data holding register.
- **Data2:** Data for DAC Channel2 to be loaded in the selected data holding register.

Return values

- **HAL:** status

Notes

- In dual mode, a unique register access is required to write in both DAC channels at the same time.

HAL_DACEx_DualGetValue

Function name

uint32_t HAL_DACEx_DualGetValue (const DAC_HandleTypeDef * hdac)

Function description

Return the last data output value of the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **The:** selected DAC channel data output value.

HAL_DACEx_ConvCpltCallbackCh2

Function name

void HAL_DACEx_ConvCpltCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Conversion complete callback in non-blocking mode for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_ConvHalfCpltCallbackCh2

Function name

void HAL_DACEx_ConvHalfCpltCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Conversion half DMA transfer callback in non-blocking mode for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_ErrorCallbackCh2

Function name

void HAL_DACEx_ErrorCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Error DAC callback for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_DMAUnderrunCallbackCh2

Function name

void HAL_DACEx_DMAUnderrunCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

DMA underrun DAC callback for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_SelfCalibrate

Function name

HAL_StatusTypeDef HAL_DACEx_SelfCalibrate (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel)

Function description

Run the self calibration of one DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC channel configuration structure.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **Updates:** DAC_TrimmingValue. , DAC_UserTrimming set to DAC_UserTrimming
- **HAL:** status

Notes

- Calibration runs about 7 ms.

HAL_DACEx_SetUserTrimming

Function name

HAL_StatusTypeDef HAL_DACEx_SetUserTrimming (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel, uint32_t NewTrimmingValue)

Function description

Set the trimming mode and trimming value (user trimming mode applied).

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC configuration structure updated with new DAC trimming value.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **NewTrimmingValue:** DAC new trimming value

Return values

- **HAL:** status

HAL_DACEx_GetTrimOffset

Function name

uint32_t HAL_DACEx_GetTrimOffset (const DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Return the DAC trimming value.

Parameters

- **hdac:** DAC handle
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **Trimming:** value : range: 0->31

DAC_DMAConvCpltCh2

Function name

void DAC_DMAConvCpltCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA conversion complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAErrorCh2

Function name

void DAC_DMAErrorCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAHalfConvCpltCh2

Function name

void DAC_DMAHalfConvCpltCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

18.2 DACEx Firmware driver defines

The following section lists the various define and macros of the module.

18.2.1 DACEx

DACEx

DACEx lfsrunmask triangle amplitude

DAC_LFSRUNMASK_BIT0

Unmask DAC channel LFSR bit0 for noise wave generation

DAC_LFSRUNMASK_BITS1_0

Unmask DAC channel LFSR bit[1:0] for noise wave generation

DAC_LFSRUNMASK_BITS2_0

Unmask DAC channel LFSR bit[2:0] for noise wave generation

DAC_LFSRUNMASK_BITS3_0

Unmask DAC channel LFSR bit[3:0] for noise wave generation

DAC_LFSRUNMASK_BITS4_0

Unmask DAC channel LFSR bit[4:0] for noise wave generation

DAC_LFSRUNMASK_BITS5_0

Unmask DAC channel LFSR bit[5:0] for noise wave generation

DAC_LFSRUNMASK_BITS6_0

Unmask DAC channel LFSR bit[6:0] for noise wave generation

DAC_LFSRUNMASK_BITS7_0

Unmask DAC channel LFSR bit[7:0] for noise wave generation

DAC_LFSRUNMASK_BITS8_0

Unmask DAC channel LFSR bit[8:0] for noise wave generation

DAC_LFSRUNMASK_BITS9_0

Unmask DAC channel LFSR bit[9:0] for noise wave generation

DAC_LFSRUNMASK_BITS10_0

Unmask DAC channel LFSR bit[10:0] for noise wave generation

DAC_LFSRUNMASK_BITS11_0

Unmask DAC channel LFSR bit[11:0] for noise wave generation

DAC_TRIANGLEAMPLITUDE_1

Select max triangle amplitude of 1

DAC_TRIANGLEAMPLITUDE_3

Select max triangle amplitude of 3

DAC_TRIANGLEAMPLITUDE_7

Select max triangle amplitude of 7

DAC_TRIANGLEAMPLITUDE_15

Select max triangle amplitude of 15

DAC_TRIANGLEAMPLITUDE_31

Select max triangle amplitude of 31

DAC_TRIANGLEAMPLITUDE_63

Select max triangle amplitude of 63

DAC_TRIANGLEAMPLITUDE_127

Select max triangle amplitude of 127

DAC_TRIANGLEAMPLITUDE_255

Select max triangle amplitude of 255

DAC_TRIANGLEAMPLITUDE_511

Select max triangle amplitude of 511

DAC_TRIANGLEAMPLITUDE_1023

Select max triangle amplitude of 1023

DAC_TRIANGLEAMPLITUDE_2047

Select max triangle amplitude of 2047

DAC_TRIANGLEAMPLITUDE_4095

Select max triangle amplitude of 4095

19 HAL DCACHE Generic Driver

19.2 DCACHE Firmware driver API description

The following section lists the various functions of the DCACHE library.

19.2.1 How to use this driver

1. Configure and enable the MPU to override default config if needed, please refers to ARM manual for default memory attribute. Then enable DCACHE.

- Use HAL_DCACHE_Invalidate() to invalidate the full cache content:
  - Cache content is lost, and reloaded when needed.
  - Used for complete invalidate of the DCACHE in case.
  - Blocking call until operation is done.
- Use HAL_DCACHE_InvalidateByAddr() to invalidate cache content for specific range:
  - Cache content for specific range is lost, and reloaded when needed.
  - Used when excepting a buffer to be updated by a peripheral (typically DMA transfer)
  - Blocking call until operation is done.
- Use HAL_DCACHE_CleanByAddr() to clean cache content for a specific range:
  - Cache content for specific range is written back to memory.
  - Used when buffer is updated by CPU before usage by a peripheral (typically DMA transfer)
  - Blocking call until operation is done.
- Use HAL_DCACHE_CleanInvalidateByAddr() to clean and invalidate cache content for a specific range:
  - Cache content for specific range is written back to memory, and reloaded when needed.
  - Used when sharing buffer between CPU and other peripheral.
  - Recommended to use for MPU reprogramming.
  - Blocking call until operation is done.

Interrupt mode IO operation

- Configure the DCACHE interrupt priority using HAL_NVIC_SetPriority()
- Enable the DCACHE IRQ handler using HAL_NVIC_EnableIRQ()
- Override weak definition for following callbacks (if needed):
  - HAL_DCACHE_CleanAndInvalidateByAddrCallback()
  - HAL_DCACHE_InvalidateCompleteCallback()
  - HAL_DCACHE_InvalidateByAddrCallback()
  - HAL_DCACHE_CleanByAddrCallback()
  - HAL_DCACHE_ErrorCallback()
- Use HAL_DCACHE_<COMMAND>_IT() to start a DCACHE operation with IT enabled.
- Use HAL_DCACHE_IRQHandler() called under DCACHEx_IRQHandler() Interrupt subroutine

Use HAL_DCACHE_GetState() function to return the DCACHE state and HAL_DCACHE_GetError() in case of error detection.

DCACHE HAL driver macros list

Below the list of macros defined in the DCACHE HAL driver.

- __HAL_DCACHE_ENABLE_IT : Enable DCACHE interrupts.
- __HAL_DCACHE_DISABLE_IT : Disable DCACHE interrupts.
- __HAL_DCACHE_GET_IT_SOURCE: Check whether the specified DCACHE interrupt source is enabled or not.
- __HAL_DCACHE_GET_FLAG : Check whether the selected DCACHE flag is set or not.
- __HAL_DCACHE_CLEAR_FLAG : Clear the selected DCACHE flags.

Note: You can refer to the header file of the DCACHE HAL driver for more useful macros.

19.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the DCACHEx peripheral:

- User must implement HAL_DCACHE_MspInit() function in which he configures all related peripherals resources (CLOCK, MPU, IT and NVIC).

- Call the function HAL_DCACHE_Init() to configure the selected device with the selected configuration:
  - ReadBurstType
- Call the function HAL_DCACHE_DeInit() to restore the reset configuration of the selected DCACHEx peripheral.

This section contains the following APIs:

- ***HAL_DCACHE_Init()***
- ***HAL_DCACHE_DeInit()***
- ***HAL_DCACHE_MspInit()***
- ***HAL_DCACHE_MspDeInit()***

19.2.3 IO operation functions

This section provides functions allowing to:

- Enable the Data cache.
- Disable the Data cache.
- Set Read Burst Type.
- Invalidate the Data cache.
- Invalidate the Data cache with interrupt.
- Clean the Data cache by Addr.
- Invalidate the Data cache by Addr.
- Clean and Invalidate the Data cache by Addr.
- Clean the Data cache by Addr with interrupt.
- Invalidate the Data cache by Addr with interrupt.
- Clean and Invalidate the Data cache by Addr with interrupt.
- Start the Data Cache performance monitoring.
- Stop the Data Cache performance monitoring.
- Reset the Data Cache performance monitoring values.
- Get the Data Cache performance Read Hit monitoring value.
- Get the Data Cache performance Read Miss monitoring value.
- Get the Data Cache performance Write Hit monitoring value.
- Get the Data Cache performance Write Miss monitoring value.

This section contains the following APIs:

- ***HAL_DCACHE_Enable()***
- ***HAL_DCACHE_Disable()***
- ***HAL_DCACHE_IsEnabled()***
- ***HAL_DCACHE_SetReadBurstType()***
- ***HAL_DCACHE_Invalidate()***
- ***HAL_DCACHE_InvalidateByAddr()***
- ***HAL_DCACHE_CleanByAddr()***
- ***HAL_DCACHE_CleanInvalidByAddr()***
- ***HAL_DCACHE_Invalidate_IT()***
- ***HAL_DCACHE_InvalidateByAddr_IT()***
- ***HAL_DCACHE_CleanByAddr_IT()***
- ***HAL_DCACHE_CleanInvalidByAddr_IT()***
- ***HAL_DCACHE_Monitor_Start()***
- ***HAL_DCACHE_Monitor_Stop()***
- ***HAL_DCACHE_Monitor_Reset()***
- ***HAL_DCACHE_Monitor_GetReadHitValue()***
- ***HAL_DCACHE_Monitor_GetReadMissValue()***
- ***HAL_DCACHE_Monitor_GetWriteHitValue()***
- ***HAL_DCACHE_Monitor_GetWriteMissValue()***

- *HAL_DCACHE_IRQHandler()*
- *HAL_DCACHE_RegisterCallback()*
- *HAL_DCACHE_UnRegisterCallback()*
- *HAL_DCACHE_CleanByAddrCallback()*
- *HAL_DCACHE_InvalidateByAddrCallback()*
- *HAL_DCACHE_CleanAndInvalidateByAddrCallback()*
- *HAL_DCACHE_InvalidateCompleteCallback()*
- *HAL_DCACHE_ErrorCallback()*

19.2.4 Peripheral State

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_DCACHE_GetState()*
- *HAL_DCACHE_GetError()*

19.2.5 Detailed description of functions

HAL_DCACHE_Init

Function name

HAL_StatusTypeDef HAL_DCACHE_Init (DCACHE_HandleTypeDef * hdcache)

Function description

Initializes the DCACHE according to the specified parameters in the DCACHE_InitTypeDef and initialize the associated handle.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHE.

Return values

- **HAL:** status

HAL_DCACHE_DeInit

Function name

HAL_StatusTypeDef HAL_DCACHE_DeInit (DCACHE_HandleTypeDef * hdcache)

Function description

DeInitialize the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

HAL_DCACHE_MspInit

Function name

void HAL_DCACHE_MspInit (DCACHE_HandleTypeDef * hdcache)

Function description

Initialize the DCACHE MSP.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_MspDeInit

Function name

void HAL_DCACHE_MspDeInit (DCACHE_HandleTypeDef * hdcache)

Function description

DeInitialize the DCACHE MSP.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_Enable

Function name

HAL_StatusTypeDef HAL_DCACHE_Enable (DCACHE_HandleTypeDef * hdcache)

Function description

Enable the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

HAL_DCACHE_Disable

Function name

HAL_StatusTypeDef HAL_DCACHE_Disable (DCACHE_HandleTypeDef * hdcache)

Function description

Disable the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

HAL_DCACHE_IsEnabled

Function name

uint32_t HAL_DCACHE_IsEnabled (const DCACHE_HandleTypeDef * hdcache)

Function description

Check whether the Data Cache is enabled or not.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Status:** (0: disabled, 1: enabled)

HAL_DCACHE_SetReadBurstType

Function name

HAL_StatusTypeDef HAL_DCACHE_SetReadBurstType (DCACHE_HandleTypeDef * hdcache, uint32_t ReadBurstType)

Function description

Set Read Burst Type.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **ReadBurstType:** Burst type to be applied for Data Cache DCACHE_READ_BURST_WRAP, DCACHE_READ_BURST_INC.

Return values

- **HAL:** status

HAL_DCACHE_Invalidate

Function name

HAL_StatusTypeDef HAL_DCACHE_Invalidate (DCACHE_HandleTypeDef * hdcache)

Function description

Invalidate the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

Notes

- This function waits for end of full cache invalidation

HAL_DCACHE_InvalidateByAddr

Function name

HAL_StatusTypeDef HAL_DCACHE_InvalidateByAddr (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Invalidate the Data cache for a specific region.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Invalidated
- **dSize:** Size of the region to be Invalidated(in bytes)

Return values

- **HAL:** status

Notes

- This function waits for end of cache Invalidation

HAL_DCACHE_CleanByAddr

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanByAddr (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean the Data cache by Addr.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned
- **dSize:** Size of the region to be Cleaned (in bytes)

Return values

- **HAL:** status

Notes

- This function waits for end of cache Clean

HAL_DCACHE_CleanInvalidByAddr

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanInvalidByAddr (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean and Invalidate the Data cache by Addr.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned and Invalidated
- **dSize:** Size of the region to be Cleaned and Invalidated (in bytes)

Return values

- **HAL:** status

Notes

- This function waits for end of cache Clean and Invalidation

HAL_DCACHE_Invalidate_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_Invalidate_IT (DCACHE_HandleTypeDef * hdcache)

Function description

Invalidate the Data cache with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_InvalidateByAddr_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_InvalidateByAddr_IT (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Invalidate the Data cache by Addr with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Invalidated
- **dSize:** Size of the region to be Invalidated

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_CleanByAddr_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanByAddr_IT (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean the Data cache by Addr with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned
- **dSize:** Size of the region to be Cleaned

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_CleanInvalidByAddr_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanInvalidByAddr_IT (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean and Invalidate the Data cache by Addr with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned and Invalidated
- **dSize:** Size of the region to be Cleaned and Invalidated

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_IRQHandler

Function name

void HAL_DCACHE_IRQHandler (DCACHE_HandleTypeDef * hdcache)

Function description

Handle the Data Cache interrupt request.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

Notes

- This API should be called under the DCACHEx_IRQHandler().

HAL_DCACHE_ErrorCallback

Function name

void HAL_DCACHE_ErrorCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Error callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_CleanByAddrCallback

Function name

void HAL_DCACHE_CleanByAddrCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache clean command by address callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_InvalidateByAddrCallback

Function name

void HAL_DCACHE_InvalidateByAddrCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache Invalidate command by address callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_InvalidateCompleteCallback

Function name

void HAL_DCACHE_InvalidateCompleteCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache full invalidation complete callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_CleanAndInvalidateByAddrCallback

Function name

void HAL_DCACHE_CleanAndInvalidateByAddrCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache clean and Invalidate command by address callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DCACHE_RegisterCallback (DCACHE_HandleTypeDef * hdcache, HAL_DCACHE_CallbackIDTypeDef CallbackID, pDCACHE_CallbackTypeDef pCallback)

Function description

Register a User DCACHE Callback To be used instead of the weak predefined callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCACHE_CLEAN_BY_ADDRESS_CB_ID Clean By Addr callback ID
  - HAL_DCACHE_INVALIDATE_BY_ADDRESS_CB_ID Invalidate By Addr callback ID
  - HAL_DCACHE_CLEAN_AND_INVALIDATE_BY_ADDRESS_CB_ID Clean and Invalidate By Addr callback ID
  - HAL_DCACHE_INVALIDATE_COMPLETE_CB_ID Invalidate Complete ID
  - HAL_DCACHE_ERROR_CB_ID Error callback ID
  - HAL_DCACHE_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCACHE_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_DCACHE_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DCACHE_UnRegisterCallback (DCACHE_HandleTypeDef * hdcache, HAL_DCACHE_CallbackIDTypeDef CallbackID)

Function description

Unregister an DCACHE Callback DCACHE callback is redirected to the weak predefined callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_DCACHE_CLEAN_BY_ADDRESS_CB_ID Clean By Addr callback ID
  - HAL_DCACHE_INVALIDATE_BY_ADDRESS_CB_ID Invalidate By Addr callback ID
  - HAL_DCACHE_CLEAN_AND_INVALIDATE_BY_ADDRESS_CB_ID Clean and Invalidate By Addr callback ID
  - HAL_DCACHE_INVALIDATE_COMPLETE_CB_ID Invalidate Complete callback ID
  - HAL_DCACHE_ERROR_CB_ID Error callback ID
  - HAL_DCACHE_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCACHE_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_DCACHE_Monitor_GetReadHitValue

Function name

uint32_t HAL_DCACHE_Monitor_GetReadHitValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Read Hit monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Read:** Hit monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_GetReadMissValue

Function name

uint32_t HAL_DCACHE_Monitor_GetReadMissValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Read Miss monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Read:** Miss monitoring value

Notes

- Upon reaching the 16-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_GetWriteHitValue

Function name

uint32_t HAL_DCACHE_Monitor_GetWriteHitValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Write Hit monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Write:** Hit monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_GetWriteMissValue

Function name

uint32_t HAL_DCACHE_Monitor_GetWriteMissValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Write Miss monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Write:** Miss monitoring value

Notes

- Upon reaching the 16-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_Reset

Function name

HAL_StatusTypeDef HAL_DCACHE_Monitor_Reset (DCACHE_HandleTypeDef * hdcache, uint32_t MonitorType)

Function description

Reset the Data Cache performance monitoring values.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **MonitorType:** Monitoring type This parameter can be a combination of the following values:
  - DCACHE_MONITOR_READ_HIT
  - DCACHE_MONITOR_READ_MISS
  - DCACHE_MONITOR_WRITE_HIT
  - DCACHE_MONITOR_WRITE_MISS
  - DCACHE_MONITOR_ALL

Return values

- **HAL:** status

HAL_DCACHE_Monitor_Start

Function name

HAL_StatusTypeDef HAL_DCACHE_Monitor_Start (DCACHE_HandleTypeDef * hdcache, uint32_t MonitorType)

Function description

Start the Data Cache performance monitoring.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **MonitorType:** Monitoring type This parameter can be a combination of the following values:
  - DCACHE_MONITOR_READ_HIT
  - DCACHE_MONITOR_READ_MISS
  - DCACHE_MONITOR_WRITE_HIT
  - DCACHE_MONITOR_WRITE_MISS
  - DCACHE_MONITOR_ALL

Return values

- **HAL:** status

HAL_DCACHE_Monitor_Stop

Function name

HAL_StatusTypeDef HAL_DCACHE_Monitor_Stop (DCACHE_HandleTypeDef * hdcache, uint32_t MonitorType)

Function description

Stop the Data Cache performance monitoring.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **MonitorType:** Monitoring type This parameter can be a combination of the following values:
  - DCACHE_MONITOR_READ_HIT
  - DCACHE_MONITOR_READ_MISS
  - DCACHE_MONITOR_WRITE_HIT
  - DCACHE_MONITOR_WRITE_MISS
  - DCACHE_MONITOR_ALL

Return values

- **HAL:** status

Notes

- Stopping the monitoring does not reset the values.

HAL_DCACHE_GetState

Function name

HAL_DCACHE_StateTypeDef HAL_DCACHE_GetState (const DCACHE_HandleTypeDef * hdcache)

Function description

Return the DCACHE handle state.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** state

HAL_DCACHE_GetError

Function name

uint32_t HAL_DCACHE_GetError (const DCACHE_HandleTypeDef * hdcache)

Function description

Return the DCACHE error code.

Parameters

- **hdcache:** pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHE.

Return values

- **DCACHE:** Error Code

19.3 DCACHE Firmware driver defines

The following section lists the various define and macros of the module.

19.3.1 DCACHE

DCACHE

Command Operation

LL_DCACHE_COMMAND_NO_OPERATION

LL_DCACHE_COMMAND_CLEAN_BY_ADDR

LL_DCACHE_COMMAND_INVALIDATE_BY_ADDR

LL_DCACHE_COMMAND_CLEAN_INVALIDATE_BY_ADDR

DCACHE Error Code

HAL_DCACHE_ERROR_NONE

No error

HAL_DCACHE_ERROR_TIMEOUT

Timeout error

HAL_DCACHE_ERROR_INVALID_CALLBACK

Invalid callback error

HAL_DCACHE_ERROR_EVICTION_CLEAN

Eviction or clean operation write-back error

HAL_DCACHE_ERROR_INVALID_OPERATION

Invalid operation

DCACHE Exported Macros

__HAL_DCACHE_ENABLE_IT

Description:

- Enable DCACHE interrupts.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __INTERRUPT__: specifies the DCACHE interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCACHE_IT_BUSYEND Busy end interrupt
  - DCACHE_IT_ERROR Cache error interrupt
  - DCACHE_IT_CMDEND Cache Command end interrupt

Return value:

- None

__HAL_DCACHE_DISABLE_IT

Description:

- Disable DCACHE interrupts.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __INTERRUPT__: specifies the DCACHE interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DCACHE_IT_BUSYEND Busy end interrupt
  - DCACHE_IT_ERROR Cache error interrupt
  - DCACHE_IT_CMDEND Cache Command end interrupt

Return value:

- None

__HAL_DCACHE_GET_IT_SOURCE

Description:

- Check whether the specified DCACHE interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __INTERRUPT__: specifies the DCACHE interrupt source to check. This parameter can be any combination of the following values:
  - DCACHE_IT_BUSYEND Busy end interrupt
  - DCACHE_IT_ERROR Cache error interrupt
  - DCACHE_IT_CMDEND Cache Command end interrupt

Return value:

- The: state of __INTERRUPT__ (SET or RESET).

__HAL_DCACHE_GET_FLAG

Description:

- Check whether the selected DCACHE flag is set or not.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - DCACHE_FLAG_BUSY Busy flag
  - DCACHE_FLAG_BUSYEND Busy end flag
  - DCACHE_FLAG_ERROR Cache error flag
  - DCACHE_FLAG_BUSYCMD Cache Busy command flag
  - DCACHE_FLAG_CMDEND Cache command end flag

Return value:

- The: state of __FLAG__ (0 or 1).

__HAL_DCACHE_CLEAR_FLAG

Description:

- Clear the selected DCACHE flags.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __FLAG__: specifies the DCACHE flags to clear. This parameter can be any combination of the following values:
  - DCACHE_FLAG_BUSYEND Busy end flag
  - DCACHE_FLAG_ERROR Cache error flag
  - DCACHE_FLAG_CMDEND Cache command end flag

Flags

DCACHE_FLAG_BUSY

Busy flag

DCACHE_FLAG_BUSYEND

Busy end flag

DCACHE_FLAG_ERROR

Cache error flag

DCACHE_FLAG_BUSYCMD

20 HAL DCMI Generic Driver

20.1 DCMI Firmware driver registers structures

20.1.1 DCMI_CodesInitTypeDef

DCMI_CodesInitTypeDef is defined in the stm32h5xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartCode***
- ***uint8_t LineStartCode***
- ***uint8_t LineEndCode***
- ***uint8_t FrameEndCode***

Field Documentation

- ***uint8_t DCMI_CodesInitTypeDef::FrameStartCode***
  Specifies the code of the frame start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineStartCode***
  Specifies the code of the line start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineEndCode***
  Specifies the code of the line end delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::FrameEndCode***
  Specifies the code of the frame end delimiter.

20.1.2 DCMI_SyncUnmaskTypeDef

DCMI_SyncUnmaskTypeDef is defined in the stm32h5xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartUnmask***
- ***uint8_t LineStartUnmask***
- ***uint8_t LineEndUnmask***
- ***uint8_t FrameEndUnmask***

Field Documentation

- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameStartUnmask***
  Specifies the frame start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineStartUnmask***
  Specifies the line start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineEndUnmask***
  Specifies the line end delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameEndUnmask***
  Specifies the frame end delimiter unmask.

20.1.3 DCMI_InitTypeDef

DCMI_InitTypeDef is defined in the stm32h5xx_hal_dcmi.h

Data Fields

- ***uint32_t SynchroMode***
- ***uint32_t PCKPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t CaptureRate***
- ***uint32_t ExtendedDataMode***
- ***DCMI_CodesInitTypeDef SyncroCode***
- ***uint32_t JPEGMode***
- ***uint32_t ByteSelectMode***

- ***uint32_t ByteSelectStart***
- ***uint32_t LineSelectMode***
- ***uint32_t LineSelectStart***

Field Documentation

- ***uint32_t DCMI_InitTypeDef::SynchroMode***
  Specifies the Synchronization Mode: Hardware or Embedded. This parameter can be a value of ***DCMI_Synchronization_Mode***
- ***uint32_t DCMI_InitTypeDef::PCKPolarity***
  Specifies the Pixel clock polarity: Falling or Rising. This parameter can be a value of ***DCMI_PIXCK_Polarity***
- ***uint32_t DCMI_InitTypeDef::VSPolarity***
  Specifies the Vertical synchronization polarity: High or Low. This parameter can be a value of ***DCMI_VSYNC_Polarity***
- ***uint32_t DCMI_InitTypeDef::HSPolarity***
  Specifies the Horizontal synchronization polarity: High or Low. This parameter can be a value of ***DCMI_HSYNC_Polarity***
- ***uint32_t DCMI_InitTypeDef::CaptureRate***
  Specifies the frequency of frame capture: All, 1/2 or 1/4. This parameter can be a value of ***DCMI_Capture_Rate***
- ***uint32_t DCMI_InitTypeDef::ExtendedDataMode***
  Specifies the data width: 8-bit, 10-bit, 12-bit or 14-bit. This parameter can be a value of ***DCMI_Extended_Data_Mode***
- ***DCMI_CodesInitTypeDef DCMI_InitTypeDef::SyncroCode***
  Specifies the code of the line/frame start delimiter and the line/frame end delimiter
- ***uint32_t DCMI_InitTypeDef::JPEGMode***
  Enable or Disable the JPEG mode. This parameter can be a value of ***DCMI_MODE_JPEG***
- ***uint32_t DCMI_InitTypeDef::ByteSelectMode***
  Specifies the data to be captured by the interface This parameter can be a value of ***DCMI_Byte_Select_Mode***
- ***uint32_t DCMI_InitTypeDef::ByteSelectStart***
  Specifies if the data to be captured by the interface is even or odd This parameter can be a value of ***DCMI_Byte_Select_Start***
- ***uint32_t DCMI_InitTypeDef::LineSelectMode***
  Specifies the line of data to be captured by the interface This parameter can be a value of ***DCMI_Line_Select_Mode***
- ***uint32_t DCMI_InitTypeDef::LineSelectStart***
  Specifies if the line of data to be captured by the interface is even or odd This parameter can be a value of ***DCMI_Line_Select_Start***

20.1.4 __DCMI_HandleTypeDef

__DCMI_HandleTypeDef is defined in the stm32h5xx_hal_dcmi.h

Data Fields

- ***DCMI_TypeDef * Instance***
- ***DCMI_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_DCMI_StateTypeDef State***
- ***__IO uint32_t XferCount***
- ***__IO uint32_t XferSize***
- ***uint32_t XferTransferNumber***
- ***uint32_t pBuffPtr***
- ***DMA_HandleTypeDef * DMA_Handle***
- ***__IO uint32_t ErrorCode***
- ***void(* FrameEventCallback***
- ***void(* VsyncEventCallback***

- ***void(* LineEventCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DCMI_TypeDef* __DCMI_HandleTypeDef::Instance***
  DCMI Register base address
- ***DCMI_InitTypeDef __DCMI_HandleTypeDef::Init***
  DCMI parameters
- ***HAL_LockTypeDef __DCMI_HandleTypeDef::Lock***
  DCMI locking object
- ***__IO HAL_DCMI_StateTypeDef __DCMI_HandleTypeDef::State***
  DCMI state
- ***__IO uint32_t __DCMI_HandleTypeDef::XferCount***
  DMA transfer counter
- ***__IO uint32_t __DCMI_HandleTypeDef::XferSize***
  DMA transfer size
- ***uint32_t __DCMI_HandleTypeDef::XferTransferNumber***
  DMA transfer number
- ***uint32_t __DCMI_HandleTypeDef::pBuffPtr***
  Pointer to DMA output buffer
- ***DMA_HandleTypeDef* __DCMI_HandleTypeDef::DMA_Handle***
  Pointer to the DMA handler
- ***__IO uint32_t __DCMI_HandleTypeDef::ErrorCode***
  DCMI Error code
- ***void(* __DCMI_HandleTypeDef::FrameEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Frame Event Callback
- ***void(* __DCMI_HandleTypeDef::VsyncEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Vsync Event Callback
- ***void(* __DCMI_HandleTypeDef::LineEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Line Event Callback
- ***void(* __DCMI_HandleTypeDef::ErrorCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Error Callback
- ***void(* __DCMI_HandleTypeDef::MspInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp Init callback
- ***void(* __DCMI_HandleTypeDef::MspDeInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp DeInit callback

20.2 DCMI Firmware driver API description

The following section lists the various functions of the DCMI library.

20.2.1 How to use this driver

The sequence below describes how to use this driver to capture image from a camera module connected to the DCMI Interface. This sequence does not take into account the configuration of the camera module, which should be made before to configure and enable the DCMI to capture images.

1. Program the required configuration through following parameters: horizontal and vertical polarity, pixel clock polarity, Capture Rate, Synchronization Mode, code of the frame delimiter and data width using HAL_DCMI_Init() function.
2. Configure the selected DMA stream to transfer Data from DCMI DR register to the destination memory buffer.
3. Program the required configuration through following parameters: DCMI mode, destination memory Buffer address and the data length and enable capture using HAL_DCMI_Start_DMA() function.
4. Optionally, configure and Enable the CROP feature to select a rectangular window from the received image using HAL_DCMI_ConfigCrop() and HAL_DCMI_EnableCrop() functions

5. The capture can be stopped using HAL_DCMI_Stop() function.
6. To control DCMI state you can use the function HAL_DCMI_GetState().

DCMI HAL driver macros list

Below the list of most used macros in DCMI HAL driver.

- __HAL_DCMI_ENABLE: Enable the DCMI peripheral.
- __HAL_DCMI_DISABLE: Disable the DCMI peripheral.
- __HAL_DCMI_GET_FLAG: Get the DCMI pending flags.
- __HAL_DCMI_CLEAR_FLAG: Clear the DCMI pending flags.
- __HAL_DCMI_ENABLE_IT: Enable the specified DCMI interrupts.
- __HAL_DCMI_DISABLE_IT: Disable the specified DCMI interrupts.
- __HAL_DCMI_GET_IT_SOURCE: Check whether the specified DCMI interrupt has occurred or not.

Note: You can refer to the DCMI HAL driver header file for more useful macros

Callback registration

20.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DCMI
- De-initialize the DCMI

This section contains the following APIs:

- ***HAL_DCMI_Init()***
- ***HAL_DCMI_DeInit()***
- ***HAL_DCMI_MspInit()***
- ***HAL_DCMI_MspDeInit()***
- ***HAL_DCMI_RegisterCallback()***
- ***HAL_DCMI_UnRegisterCallback()***

20.2.3 IO operation functions

This section provides functions allowing to:

- Configure destination address and data length and Enables DCMI DMA request and enables DCMI capture
- Stop the DCMI capture.
- Handles DCMI interrupt request.

This section contains the following APIs:

- ***HAL_DCMI_Start_DMA()***
- ***HAL_DCMI_Stop()***
- ***HAL_DCMI_Suspend()***
- ***HAL_DCMI_Resume()***
- ***HAL_DCMI_IRQHandler()***
- ***HAL_DCMI_ErrorCallback()***
- ***HAL_DCMI_LineEventCallback()***
- ***HAL_DCMI_VsyncEventCallback()***
- ***HAL_DCMI_FrameEventCallback()***

20.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the CROP feature.
- Enable/Disable the CROP feature.
- Set embedded synchronization delimiters unmasks.

This section contains the following APIs:

- *HAL_DCMI_ConfigCrop()*
- *HAL_DCMI_DisableCrop()*
- *HAL_DCMI_EnableCrop()*
- *HAL_DCMI_ConfigSyncUnmask()*

20.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the DCMI state.
- Get the specific DCMI error flag.

This section contains the following APIs:

- *HAL_DCMI_GetState()*
- *HAL_DCMI_GetError()*
- *HAL_DCMI_RegisterCallback()*
- *HAL_DCMI_UnRegisterCallback()*

20.2.6 Detailed description of functions

HAL_DCMI_Init

Function name

HAL_StatusTypeDef HAL_DCMI_Init (DCMI_HandleTypeDef * hdcmi)

Function description

Initializes the DCMI according to the specified parameters in the DCMI_InitTypeDef and create the associated handle.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_DeInit

Function name

HAL_StatusTypeDef HAL_DCMI_DeInit (DCMI_HandleTypeDef * hdcmi)

Function description

Deinitializes the DCMI peripheral registers to their default reset values.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_MspInit

Function name

void HAL_DCMI_MspInit (DCMI_HandleTypeDef * hdcmi)

Function description

Initializes the DCMI MSP.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_MspDeInit

Function name

void HAL_DCMI_MspDeInit (DCMI_HandleTypeDef * hdcmi)

Function description

DeInitializes the DCMI MSP.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_RegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID, pDCMI_CallbackTypeDef pCallback)

Function description

Register a User DCMI Callback To be used instead of the weak predefined callback.

Parameters

- **hdcmi:** DCMI handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCMI_LINE_EVENT_CB_ID Line Event callback ID
  - HAL_DCMI_FRAME_EVENT_CB_ID Frame Event callback ID
  - HAL_DCMI_VSYNC_EVENT_CB_ID Vsync Event callback ID
  - HAL_DCMI_ERROR_CB_ID Error callback ID
  - HAL_DCMI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCMI_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_DCMI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_UnRegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID)

Function description

Unregister a DCMI Callback DCMI callback is redirected to the weak predefined callback.

Parameters

- **hdcmi:** DCMI handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCMI_LINE_EVENT_CB_ID Line Event callback ID
  - HAL_DCMI_FRAME_EVENT_CB_ID Frame Event callback ID
  - HAL_DCMI_VSYNC_EVENT_CB_ID Vsync Event callback ID
  - HAL_DCMI_ERROR_CB_ID Error callback ID
  - HAL_DCMI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCMI_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_DCMI_Start_DMA

Function name

HAL_StatusTypeDef HAL_DCMI_Start_DMA (DCMI_HandleTypeDef * hdcmi, uint32_t DCMI_Mode, uint32_t pData, uint32_t Length)

Function description

Enables DCMI DMA request and enables DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **DCMI_Mode:** DCMI capture mode snapshot or continuous grab.
- **pData:** The destination memory Buffer address (LCD Frame buffer).
- **Length:** The length of capture to be transferred.

Return values

- **HAL:** status

HAL_DCMI_Stop

Function name

HAL_StatusTypeDef HAL_DCMI_Stop (DCMI_HandleTypeDef * hdcmi)

Function description

Disable DCMI DMA request and Disable DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_Suspend

Function name

HAL_StatusTypeDef HAL_DCMI_Suspend (DCMI_HandleTypeDef * hdcmi)

Function description

Suspend DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_Resume

Function name

HAL_StatusTypeDef HAL_DCMI_Resume (DCMI_HandleTypeDef * hdcmi)

Function description

Resume DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_ErrorCallback

Function name

void HAL_DCMI_ErrorCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Error DCMI callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_LineEventCallback

Function name

void HAL_DCMI_LineEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Line Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_FrameEventCallback

Function name

void HAL_DCMI_FrameEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Frame Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_VsyncEventCallback

Function name

void HAL_DCMI_VsyncEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

VSYNC Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_IRQHandler

Function name

void HAL_DCMI_IRQHandler (DCMI_HandleTypeDef * hdcmi)

Function description

Handles DCMI interrupt request.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for the DCMI.

Return values

- **None:**

HAL_DCMI_ConfigCrop

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigCrop (DCMI_HandleTypeDef * hdcmi, uint32_t X0, uint32_t Y0, uint32_t XSize, uint32_t YSize)

Function description

Configure the DCMI CROP coordinate.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **YSize:** DCMI Line number
- **XSize:** DCMI Pixel per line
- **X0:** DCMI window X offset
- **Y0:** DCMI window Y offset

Return values

- **HAL:** status

HAL_DCMI_EnableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_EnableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

Enable the Crop feature.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_DisableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_DisableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

Disable the Crop feature.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_ConfigSyncUnmask

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigSyncUnmask (DCMI_HandleTypeDef * hdcmi, DCMI_SyncUnmaskTypeDef * SyncUnmask)

Function description

Set embedded synchronization delimiters unmasks.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **SyncUnmask:** pointer to a DCMI_SyncUnmaskTypeDef structure that contains the embedded synchronization delimiters unmasks.

Return values

- **HAL:** status

HAL_DCMI_GetState

Function name

HAL_DCMI_StateTypeDef HAL_DCMI_GetState (const DCMI_HandleTypeDef * hdcmi)

Function description

Return the DCMI state.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** state

HAL_DCMI_GetError

Function name

uint32_t HAL_DCMI_GetError (const DCMI_HandleTypeDef * hdcmi)

Function description

Return the DCMI error code.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **DCMI:** Error Code

20.3 DCMI Firmware driver defines

The following section lists the various define and macros of the module.

20.3.1 DCMI

DCMI

DCMI Byte Select Mode

DCMI_BSM_ALL

Interface captures all received data

DCMI_BSM_OTHER

Interface captures every other byte from the received data

DCMI_BSM_ALTERNATE_4

Interface captures one byte out of four

DCMI_BSM_ALTERNATE_2

Interface captures two bytes out of four

DCMI Byte Select Start

DCMI_OEBS_ODD

Interface captures first data from the frame/line start, second one being dropped

DCMI_OEBS_EVEN

Interface captures second data from the frame/line start, first one being dropped

DCMI Capture Mode

DCMI_MODE_CONTINUOUS

The received data are transferred continuously into the destination memory through the DMA

DCMI_MODE_SNAPSHOT

Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA

DCMI Capture Rate

DCMI_CR_ALL_FRAME

All frames are captured

DCMI_CR_ALTERNATE_2_FRAME

Every alternate frame captured

DCMI_CR_ALTERNATE_4_FRAME

One frame in 4 frames captured

DCMI Error Code

HAL_DCMI_ERROR_NONE

No error

HAL_DCMI_ERROR_OVR

Overrun error

HAL_DCMI_ERROR_SYNC

Synchronization error

HAL_DCMI_ERROR_TIMEOUT

Timeout error

HAL_DCMI_ERROR_DMA

DMA error

HAL_DCMI_ERROR_INVALID_CALLBACK

Invalid callback error

DCMI Exported Macros

__HAL_DCMI_RESET_HANDLE_STATE

Description:

- Reset DCMI handle state.

Parameters:

- __HANDLE__: specifies the DCMI handle.

Return value:

- None

__HAL_DCMI_ENABLE

Description:

- Enable the DCMI.

Parameters:

- __HANDLE__: DCMI handle

Return value:

- None

__HAL_DCMI_DISABLE

Description:

- Disable the DCMI.

Parameters:

- __HANDLE__: DCMI handle

Return value:

- None

__HAL_DCMI_GET_FLAG

Description:

- Get the DCMI pending flag.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: Get the specified flag. This parameter can be one of the following values (no combination allowed)
  - DCMI_FLAG_HSYNC: HSYNC pin state (active line / synchronization between lines)
  - DCMI_FLAG_VSYNC: VSYNC pin state (active frame / synchronization between frames)
  - DCMI_FLAG_FNE: FIFO empty flag
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVRRI: Overrun flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask
  - DCMI_FLAG_FRAMEMI: DCMI Capture complete masked interrupt status
  - DCMI_FLAG_OVRMI: DCMI Overrun masked interrupt status
  - DCMI_FLAG_ERRMI: DCMI Synchronization error masked interrupt status
  - DCMI_FLAG_VSYNCMI: DCMI VSYNC masked interrupt status
  - DCMI_FLAG_LINEMI: DCMI Line masked interrupt status

Return value:

- The: state of FLAG.

__HAL_DCMI_CLEAR_FLAG

Description:

- Clear the DCMI pending flags.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVFRI: Overflow flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask

Return value:

- None

__HAL_DCMI_ENABLE_IT

Description:

- Enable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_DISABLE_IT

Description:

- Disable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_GET_IT_SOURCE

Description:

- Check whether the specified DCMI interrupt has occurred or not.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt source to check. This parameter can be one of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- The: state of INTERRUPT.

DCMI Extended Data Mode

DCMI_EXTEND_DATA_8B

Interface captures 8-bit data on every pixel clock

DCMI_EXTEND_DATA_10B

Interface captures 10-bit data on every pixel clock

DCMI_EXTEND_DATA_12B

Interface captures 12-bit data on every pixel clock

DCMI_EXTEND_DATA_14B

Interface captures 14-bit data on every pixel clock

DCMI Flags

DCMI_FLAG_HSYNC

HSYNC pin state (active line / synchronization between lines)

DCMI_FLAG_VSYNC

VSYNC pin state (active frame / synchronization between frames)

DCMI_FLAG_FNE

FIFO not empty flag

DCMI_FLAG_FRAMERI

Frame capture complete interrupt flag

DCMI_FLAG_OVRRI

Overrun interrupt flag

DCMI_FLAG_ERRRI

Synchronization error interrupt flag

DCMI_FLAG_VSYNCRI

VSYNC interrupt flag

DCMI_FLAG_LINERI

Line interrupt flag

DCMI_FLAG_FRAMEMI

DCMI Frame capture complete masked interrupt status

DCMI_FLAG_OVRMI

DCMI Overrun masked interrupt status

DCMI_FLAG_ERRMI

DCMI Synchronization error masked interrupt status

DCMI_FLAG_VSYNCMI

DCMI VSYNC masked interrupt status

DCMI_FLAG_LINEMI

DCMI Line masked interrupt status

DCMI HSYNC Polarity

DCMI_HSPOLARITY_LOW

Horizontal synchronization active Low

DCMI_HSPOLARITY_HIGH

Horizontal synchronization active High

DCMI interrupt sources

DCMI_IT_FRAME

Capture complete interrupt

DCMI_IT_OVR

Overrun interrupt

DCMI_IT_ERR

Synchronization error interrupt

DCMI_IT_VSYNC

VSYNC interrupt

DCMI_IT_LINE

Line interrupt

DCMI Line Select Mode

DCMI_LSM_ALL

Interface captures all received lines

DCMI_LSM_ALTERNATE_2

Interface captures one line out of two

DCMI Line Select Start

DCMI_OELS_ODD

Interface captures first line from the frame start, second one being dropped

DCMI_OELS_EVEN

Interface captures second line from the frame start, first one being dropped

DCMI Mis Index

DCMI_MIS_INDEX

DCMI MIS register index

DCMI MODE JPEG

DCMI_JPEG_DISABLE

Mode JPEG Disabled

DCMI_JPEG_ENABLE

Mode JPEG Enabled

DCMI PIXCK Polarity

DCMI_PCKPOLARITY_FALLING

Pixel clock active on Falling edge

DCMI_PCKPOLARITY_RISING

Pixel clock active on Rising edge

DCMI SR Index

DCMI_SR_INDEX

DCMI SR register index

DCMI Stop Time Out

HAL_TIMEOUT_DCMI_STOP

DCMI Synchronization Mode

DCMI_SYNCHRO_HARDWARE

Hardware synchronization data capture (frame/line start/stop) is synchronized with the HSYNC/VSYNC signals

DCMI_SYNCHRO_EMBEDDED

Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow

DCMI VSYNC Polarity

DCMI_VSPOLARITY_LOW

Vertical synchronization active Low

DCMI_VSPOLARITY_HIGH

Vertical synchronization active High

DCMI Window Coordinate

DCMI_WINDOW_COORDINATE

Window coordinate

DCMI Window Height

DCMI_WINDOW_HEIGHT

Window Height

21 HAL DMA Generic Driver

21.1 DMA Firmware driver registers structures

21.1.1 DMA_InitTypeDef

DMA_InitTypeDef is defined in the stm32h5xx_hal_dma.h

Data Fields

- ***uint32_t Request***
- ***uint32_t BlkHWRequest***
- ***uint32_t Direction***
- ***uint32_t SrcInc***
- ***uint32_t DestInc***
- ***uint32_t SrcDataWidth***
- ***uint32_t DestDataWidth***
- ***uint32_t Priority***
- ***uint32_t SrcBurstLength***
- ***uint32_t DestBurstLength***
- ***uint32_t TransferAllocatedPort***
- ***uint32_t TransferEventMode***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t DMA_InitTypeDef::Request***
  Specifies the DMA channel request. This parameter can be a value of ***DMA_Request_Selection***
- ***uint32_t DMA_InitTypeDef::BlkHWRequest***
  Specifies the Block hardware request mode for DMA channel. Block Hardware request feature can be used only with dedicated peripherals. This parameter can be a value of ***DMA_Block_Request***
- ***uint32_t DMA_InitTypeDef::Direction***
  Specifies the transfer direction for DMA channel. This parameter can be a value of ***DMA_Transfer_Direction***
- ***uint32_t DMA_InitTypeDef::SrcInc***
  Specifies the source increment mode for the DMA channel. This parameter can be a value of ***DMA_Source_Increment_Mode***
- ***uint32_t DMA_InitTypeDef::DestInc***
  Specifies the destination increment mode for the DMA channel. This parameter can be a value of ***DMA_Destination_Increment_Mode***
- ***uint32_t DMA_InitTypeDef::SrcDataWidth***
  Specifies the source data width for the DMA channel. This parameter can be a value of ***DMA_Source_Data_Width***
- ***uint32_t DMA_InitTypeDef::DestDataWidth***
  Specifies the destination data width for the DMA channel. This parameter can be a value of ***DMA_Destination_Data_Width***
- ***uint32_t DMA_InitTypeDef::Priority***
  Specifies the priority level for the DMA channel. This parameter can be a value of ***DMA_Priority_Level***
- ***uint32_t DMA_InitTypeDef::SrcBurstLength***
  Specifies the source burst length (number of beats within a burst) for the DMA channel. This parameter can be a value between 1 and 64
- ***uint32_t DMA_InitTypeDef::DestBurstLength***
  Specifies the destination burst length (number of beats within a burst) for the DMA channel. This parameter can be a value between 1 and 64
- ***uint32_t DMA_InitTypeDef::TransferAllocatedPort***
  Specifies the transfer allocated ports. This parameter can be a combination of ***DMA_Transfer_Allocated_Port***

- ***uint32_t DMA_InitTypeDef::TransferEventMode***
  Specifies the transfer event mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Event_Mode***
- ***uint32_t DMA_InitTypeDef::Mode***
  Specifies the transfer mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Mode***

21.1.2 DMA_InitLinkedListTypeDef

DMA_InitLinkedListTypeDef is defined in the stm32h5xx_hal_dma.h

Data Fields

- ***uint32_t Priority***
- ***uint32_t LinkStepMode***
- ***uint32_t LinkAllocatedPort***
- ***uint32_t TransferEventMode***
- ***uint32_t LinkedListMode***

Field Documentation

- ***uint32_t DMA_InitLinkedListTypeDef::Priority***
  Specifies the priority level for the DMA channel. This parameter can be a value of ***DMA_Priority_Level***
- ***uint32_t DMA_InitLinkedListTypeDef::LinkStepMode***
  Specifies the link step mode for the DMA channel. This parameter can be a value of ***DMAEx_Link_Step_Mode***
- ***uint32_t DMA_InitLinkedListTypeDef::LinkAllocatedPort***
  Specifies the linked-list allocated port for the DMA channel. This parameter can be a value of ***DMAEx_Link_Allocated_Port***
- ***uint32_t DMA_InitLinkedListTypeDef::TransferEventMode***
  Specifies the transfer event mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Event_Mode***
- ***uint32_t DMA_InitLinkedListTypeDef::LinkedListMode***
  Specifies linked-list transfer mode for the DMA channel. This parameter can be a value of ***DMAEx_LinkedList_Mode***

21.1.3 __DMA_HandleTypeDef

__DMA_HandleTypeDef is defined in the stm32h5xx_hal_dma.h

Data Fields

- ***DMA_Channel_TypeDef * Instance***
- ***DMA_InitTypeDef Init***
- ***DMA_InitLinkedListTypeDef InitLinkedList***
- ***HAL_LockTypeDef Lock***
- ***uint32_t Mode***
- ***__IO HAL_DMA_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void * Parent***
- ***void(* XferCpltCallback***
- ***void(* XferHalfCpltCallback***
- ***void(* XferErrorCallback***
- ***void(* XferAbortCallback***
- ***void(* XferSuspendCallback***
- ***struct __DMA_QListTypeDef * LinkedListQueue***

Field Documentation

- ***DMA_Channel_TypeDef* __DMA_HandleTypeDef::Instance***
  Register the DMA channel base address
- ***DMA_InitTypeDef __DMA_HandleTypeDef::Init***
  DMA channel init parameters

- ***DMA_InitLinkedListTypeDef __DMA_HandleTypeDef::InitLinkedList***
  DMA channel linked-list init parameters
- ***HAL_LockTypeDef __DMA_HandleTypeDef::Lock***
  DMA locking object
- ***uint32_t __DMA_HandleTypeDef::Mode***
  DMA transfer mode
- ***__IO HAL_DMA_StateTypeDef __DMA_HandleTypeDef::State***
  DMA transfer state
- ***__IO uint32_t __DMA_HandleTypeDef::ErrorCode***
  DMA error code
- ***void* __DMA_HandleTypeDef::Parent***
  Parent object state
- ***void(* __DMA_HandleTypeDef::XferCpltCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer complete callback
- ***void(* __DMA_HandleTypeDef::XferHalfCpltCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA half transfer complete callback
- ***void(* __DMA_HandleTypeDef::XferErrorCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer error callback
- ***void(* __DMA_HandleTypeDef::XferAbortCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer Abort callback
- ***void(* __DMA_HandleTypeDef::XferSuspendCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer Suspend callback
- ***struct __DMA_QListTypeDef* __DMA_HandleTypeDef::LinkedListQueue***
  DMA linked-list queue

21.2 DMA Firmware driver API description

The following section lists the various functions of the DMA library.

21.2.1

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.2 How to use this driver

21.2.3

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.4

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.5 Initialization and de-initialization functions

21.2.6

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.

- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.7

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.8 IO operation functions

21.2.9

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.10

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.11 State and Errors functions

21.2.12

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.13

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.

- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.14 DMA Attributes functions

21.2.15

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

21.2.16 Detailed description of functions

HAL_DMA_Init

Function name

HAL_StatusTypeDef HAL_DMA_Init (DMA_HandleTypeDef *const hdma)

Function description

Initialize the DMA channel in normal mode according to the specified parameters in the DMA_InitTypeDef and create the associated handle.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_DeInit

Function name

HAL_StatusTypeDef HAL_DMA_DeInit (DMA_HandleTypeDef *const hdma)

Function description

DeInitialize the DMA channel when it is configured in normal mode.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_Start

Function name

HAL_StatusTypeDef HAL_DMA_Start (DMA_HandleTypeDef *const hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SrcDataSize)

Function description

Start the DMA channel transfer in normal mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **SrcAddress:** : The source data address.
- **DstAddress:** : The destination data address.
- **SrcDataSize:** : The length of data to be transferred from source to destination in bytes.

Return values

- **HAL:** status.

HAL_DMA_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA_Start_IT (DMA_HandleTypeDef *const hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SrcDataSize)

Function description

Starts the DMA channel transfer in normal mode with interrupts enabled (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **SrcAddress:** : The source data address.
- **DstAddress:** : The destination data address.
- **SrcDataSize:** : The length of data to be transferred from source to destination in bytes.

Return values

- **HAL:** status.

HAL_DMA_Abort

Function name

HAL_StatusTypeDef HAL_DMA_Abort (DMA_HandleTypeDef *const hdma)

Function description

Abort any on-going DMA channel transfer (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

Notes

- After suspending a DMA channel, a wait until the DMA channel is effectively stopped is added. If a channel is suspended while a data transfer is on-going, the current data will be transferred and the channel will be effectively suspended only after the transfer of any on-going data is finished.

HAL_DMA_Abort_IT

Function name

HAL_StatusTypeDef HAL_DMA_Abort_IT (DMA_HandleTypeDef *const hdma)

Function description

Abort any on-going DMA channel transfer in interrupt mode (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_PollForTransfer

Function name

HAL_StatusTypeDef HAL_DMA_PollForTransfer (DMA_HandleTypeDef *const hdma, HAL_DMA_LevelCompleteTypeDef CompleteLevel, uint32_t Timeout)

Function description

Polling for transfer status (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CompleteLevel:** : Specifies the DMA level complete.
- **Timeout:** : Timeout duration.

Return values

- **HAL:** status

HAL_DMA_IRQHandler

Function name

void HAL_DMA_IRQHandler (DMA_HandleTypeDef *const hdma)

Function description

Handle DMA interrupt request (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **None.:**

HAL_DMA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_RegisterCallback (DMA_HandleTypeDef *const hdma, HAL_DMA_CallbackIDTypeDef CallbackID, void(*)(DMA_HandleTypeDef *const _hdma) pCallback)

Function description

Register callback according to specified ID.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CallbackID:** : User Callback identifier which could be a value of HAL_DMA_CallbackIDTypeDef enumeration.
- **pCallback:** : Pointer to private callback function.

Return values

- **HAL:** status.

Notes

- The HAL_DMA_RegisterCallback() may be called before HAL_DMA_Init() in HAL_DMA_STATE_RESET to register callbacks for HAL_DMA_MSPINIT_CB_ID and HAL_DMA_MSPDEINIT_CB_ID.

HAL_DMA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_UnRegisterCallback (DMA_HandleTypeDef *const hdma, HAL_DMA_CallbackIDTypeDef CallbackID)

Function description

Unregister callback according to specified ID.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CallbackID:** : User Callback identifier which could be a value of HAL_DMA_CallbackIDTypeDef enum.

Return values

- **HAL:** status.

Notes

- The HAL_DMA_UnRegisterCallback() may be called before HAL_DMA_Init() in HAL_DMA_STATE_RESET to un-register callbacks for HAL_DMA_MSPINIT_CB_ID and HAL_DMA_MSPDEINIT_CB_ID.

HAL_DMA_GetState

Function name

HAL_DMA_StateTypeDef HAL_DMA_GetState (DMA_HandleTypeDef const *const hdma)

Function description

Returns the DMA channel state.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **DMA:** state.

HAL_DMA_GetError

Function name

uint32_t HAL_DMA_GetError (DMA_HandleTypeDef const *const hdma)

Function description

Return the DMA channel error code.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **DMA:** Error Code.

HAL_DMA_ConfigChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_ConfigChannelAttributes (DMA_HandleTypeDef *const hdma, uint32_t ChannelAttributes)

Function description

Configure the DMA channel security and privilege attribute(s).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **ChannelAttributes:** : Specifies the DMA channel secure/privilege attributes. This parameter can be a one or a combination of DMA Channel Attributes.

Return values

- **HAL:** Status.

Notes

- These attributes cannot be modified when the corresponding lock state is enabled.

HAL_DMA_GetConfigChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetConfigChannelAttributes (DMA_HandleTypeDef const *const hdma, uint32_t *const pChannelAttributes)

Function description

Get the DMA channel security and privilege attributes.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pChannelAttributes:** : Pointer to the returned attributes.

Return values

- **HAL:** Status.

HAL_DMA_LockChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_LockChannelAttributes (DMA_HandleTypeDef const *const hdma)

Function description

Lock the DMA channel security and privilege attribute(s).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** Status.

HAL_DMA_GetLockChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetLockChannelAttributes (DMA_HandleTypeDef const *const hdma, uint32_t *const pLockState)

Function description

Get the security and privilege attribute lock state of a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pLockState:** : Pointer to lock state (returned value can be DMA_CHANNEL_ATTRIBUTE_UNLOCKED or DMA_CHANNEL_ATTRIBUTE_LOCKED).

Return values

- **HAL:** status.

21.3 DMA Firmware driver defines

The following section lists the various define and macros of the module.

21.3.1 DMA

DMA

DMA Block Request

DMA_BREQ_SINGLE_BURST

Hardware request protocol at a single / burst level

DMA_BREQ_BLOCK

Hardware request protocol at a block level

DMA Channel Attributes

DMA_CHANNEL_PRIV

Channel is privileged

DMA_CHANNEL_NPRIV

Channel is unprivileged

DMA_CHANNEL_SEC

Channel is secure

DMA_CHANNEL_NSEC

Channel is non-secure

DMA_CHANNEL_SRC_SEC

Channel source is secure

DMA_CHANNEL_SRC_NSEC

Channel source is non-secure

DMA_CHANNEL_DEST_SEC

Channel destination is secure

DMA_CHANNEL_DEST_NSEC

Channel destination is non-secure

DMA_CHANNEL_ATTRIBUTE_UNLOCKED

Channel attribute is unlocked

DMA_CHANNEL_ATTRIBUTE_LOCKED

Channel attribute is locked

DMA destination Data Width

DMA_DEST_DATAWIDTH_BYTE

Destination data width : Byte

DMA_DEST_DATAWIDTH_HALFWORD

Destination data width : HalfWord

DMA_DEST_DATAWIDTH_WORD

Destination data width : Word

DMA Destination Increment Mode

DMA_DINC_FIXED

Destination fixed single / burst

DMA_DINC_INCREMENTED

Destination incremented single / burst

DMA Error Codes

HAL_DMA_ERROR_NONE

No error

HAL_DMA_ERROR_DTE

Data transfer error

HAL_DMA_ERROR_ULE

Update linked-list item error

HAL_DMA_ERROR_USE

User setting error

HAL_DMA_ERROR_TO

Trigger overrun error

HAL_DMA_ERROR_TIMEOUT

Timeout error

HAL_DMA_ERROR_NO_XFER

No transfer ongoing error

HAL_DMA_ERROR_BUSY

Busy error

HAL_DMA_ERROR_INVALID_CALLBACK

Invalid callback error

HAL_DMA_ERROR_NOT_SUPPORTED

Not supported mode

DMA Exported Macros

__HAL_DMA_RESET_HANDLE_STATE

Description:

- Reset DMA handle state.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None.

__HAL_DMA_ENABLE

Description:

- Enable the specified DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None

__HAL_DMA_DISABLE

Description:

- Disable the specified DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None

__HAL_DMA_GET_FLAG

Description:

- Get the DMA channel pending flags.

Parameters:

- __HANDLE__: : DMA handle.
- __FLAG__: : Get the specified flag. This parameter can be any combination of the following values:
  - DMA_FLAG_TC : Transfer Complete flag.
  - DMA_FLAG_HT : Half Transfer Complete flag.
  - DMA_FLAG_DTE : Data Transfer Error flag.
  - DMA_FLAG_ULE : Update linked-list Error flag.
  - DMA_FLAG_USE : User Setting Error flag.
  - DMA_FLAG_TO : Trigger Overrun flag.
  - DMA_FLAG_SUSP : Completed Suspension flag.
  - DMA_FLAG_IDLEF : Idle flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_DMA_CLEAR_FLAG

Description:

- Clear the DMA Channel pending flags.

Parameters:

- __HANDLE__: : DMA handle.
- __FLAG__: : Specifies the flag to clear. This parameter can be any combination of the following values:
  - DMA_FLAG_TC : Transfer Complete flag.
  - DMA_FLAG_HT : Half Transfer Complete flag.
  - DMA_FLAG_DTE : Data Transfer Error flag.
  - DMA_FLAG_ULE : Update Linked-List Error flag.
  - DMA_FLAG_USE : User Setting Error flag.
  - DMA_FLAG_TO : Trigger Overrun flag.
  - DMA_FLAG_SUSP : Completed Suspension flag.

Return value:

- None

__HAL_DMA_ENABLE_IT

Description:

- Enable the specified DMA Channel interrupts.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : Specifies the DMA interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- None

__HAL_DMA_DISABLE_IT

Description:

- Disable the specified DMA Channel interrupts.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : specifies the DMA interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- None

__HAL_DMA_GET_IT_SOURCE

Description:

- Checks whether the specified DMA Channel interrupt is enabled or not.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : specifies the DMA interrupt source to check.
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- The: state of DMA_IT (SET or RESET).

__HAL_DMA_SET_COUNTER

Description:

- Writes the block number of bytes to be transferred from the source on the DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.
- __COUNTER__: : Number of data bytes to be transferred from the source (from 0 to 65535).

__HAL_DMA_GET_COUNTER

Description:

- Returns the number of remaining data bytes in the current DMA Channel transfer.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- The: number of remaining data units in the current DMA Stream transfer.

DMA Flag Definition

DMA_FLAG_IDLE

Idle flag

DMA_FLAG_TC

Transfer complete flag

DMA_FLAG_HT

Half transfer complete flag

DMA_FLAG_DTE

Data transfer error flag

DMA_FLAG_ULE

Update linked-list item error flag

DMA_FLAG_USE

User setting error flag

DMA_FLAG_SUSP

Completed suspension flag

DMA_FLAG_TO

Trigger overrun flag

TIM DMA Handle Index

TIM_DMA_ID_UPDATE

Index of the DMA handle used for Update DMA requests

TIM_DMA_ID_CC1

Index of the DMA handle used for Capture/Compare 1 DMA requests

TIM_DMA_ID_CC2

Index of the DMA handle used for Capture/Compare 2 DMA requests

TIM_DMA_ID_CC3

Index of the DMA handle used for Capture/Compare 3 DMA requests

TIM_DMA_ID_CC4

Index of the DMA handle used for Capture/Compare 4 DMA requests

TIM_DMA_ID_COMMUTATION

Index of the DMA handle used for Commutation DMA requests

TIM_DMA_ID_TRIGGER

Index of the DMA handle used for Trigger DMA requests

DMA Interrupt Enable Definition

DMA_IT_TC

Transfer complete interrupt

DMA_IT_HT

Half transfer complete interrupt

DMA_IT_DTE

Data transfer error interrupt

DMA_IT_ULE

Update linked-list item error interrupt

DMA_IT_USE

User eetting error interrupt

DMA_IT_SUSP

Completed suspension interrupt

DMA_IT_TO

Trigger overrun interrupt

DMA Priority Level

DMA_LOW_PRIORITY_LOW_WEIGHT

Priority level : Low Priority, Low weight

DMA_LOW_PRIORITY_MID_WEIGHT

Priority level : Low Priority, Mid weight

DMA_LOW_PRIORITY_HIGH_WEIGHT

Priority level : Low Priority, High weight

DMA_HIGH_PRIORITY

Priority level : HIGH Priority

DMA Request Selection

GPDMA1_REQUEST_ADC1

GPDMA1 HW request is ADC1

GPDMA1_REQUEST_ADC2

GPDMA1 HW request is ADC2

DMA_REQUEST_SW

DMA SW request

DMA Source Data Width

DMA_SRC_DATAWIDTH_BYTE

Source data width : Byte

DMA_SRC_DATAWIDTH_HALFWORD

Source data width : HalfWord

DMA_SRC_DATAWIDTH_WORD

Source data width : Word

DMA Source Increment Mode

DMA_SINC_FIXED

Source fixed single / burst

DMA_SINC_INCREMENTED

Source incremented single / burst

DMA Transfer Allocated Port

DMA_SRC_ALLOCATED_PORT0

Source allocated Port 0

DMA_SRC_ALLOCATED_PORT1

Source allocated Port 1

DMA_DEST_ALLOCATED_PORT0

Destination allocated Port 0

DMA_DEST_ALLOCATED_PORT1

Destination allocated Port 1

DMA Transfer Direction

DMA_PERIPH_TO_MEMORY

Peripheral to memory direction

DMA_MEMORY_TO_PERIPH

Memory to peripheral direction

DMA_MEMORY_TO_MEMORY

Memory to memory direction

DMA Transfer Event Mode

DMA_TCEM_BLOCK_TRANSFER

The TC event is generated at the end of each block and the HT event is generated at the half of each block

DMA_TCEM_REPEATED_BLOCK_TRANSFER

The TC event is generated at the end of the repeated block and the HT event is generated at the half of the repeated block

DMA_TCEM_EACH_LL_ITEM_TRANSFER

The TC event is generated at the end of each linked-list item and the HT event is generated at the half of each linked-list item

DMA_TCEM_LAST_LL_ITEM_TRANSFER

The TC event is generated at the end of the last linked-list item and the HT event is generated at the half of the last linked-list item

DMA Transfer Mode

DMA_NORMAL

Normal DMA transfer

DMA_PFCTRL

HW request peripheral flow control mode

22 HAL DMA Extension Driver

22.1 DMAEx Firmware driver registers structures

22.1.1 DMA_DataHandlingConfTypeDef

DMA_DataHandlingConfTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***uint32_t DataExchange***
- ***uint32_t DataAlignment***

Field Documentation

- ***uint32_t DMA_DataHandlingConfTypeDef::DataExchange***
  Specifies the DMA channel data exchange mode. This parameter can be a value of ***DMAEx_Data_Exchange***
- ***uint32_t DMA_DataHandlingConfTypeDef::DataAlignment***
  Specifies the DMA channel data padding and alignment mode This parameter can be a value of ***DMAEx_Data_Alignment***

22.1.2 DMA_TriggerConfTypeDef

DMA_TriggerConfTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***uint32_t TriggerMode***
- ***uint32_t TriggerPolarity***
- ***uint32_t TriggerSelection***

Field Documentation

- ***uint32_t DMA_TriggerConfTypeDef::TriggerMode***
  Specifies the DMA channel trigger mode. This parameter can be a value of ***DMAEx_Trigger_Mode***
- ***uint32_t DMA_TriggerConfTypeDef::TriggerPolarity***
  Specifies the DMA channel trigger event polarity. This parameter can be a value of ***DMAEx_Trigger_Polarity***
- ***uint32_t DMA_TriggerConfTypeDef::TriggerSelection***
  Specifies the DMA channel trigger event selection. This parameter can be a value of ***DMAEx_Trigger_Selection***

22.1.3 DMA_RepeatBlockConfTypeDef

DMA_RepeatBlockConfTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***uint32_t RepeatCount***
- ***int32_t SrcAddrOffset***
- ***int32_t DestAddrOffset***
- ***int32_t BlkSrcAddrOffset***
- ***int32_t BlkDestAddrOffset***

Field Documentation

- ***uint32_t DMA_RepeatBlockConfTypeDef::RepeatCount***
  Specifies the DMA channel repeat count (the number of repetitions of block). This parameter can be a value between 1 and 2048
- ***int32_t DMA_RepeatBlockConfTypeDef::SrcAddrOffset***
  Specifies the DMA channel single/burst source address offset : This parameter can be a value between -8191 and 8191. If source address offset > 0 => Increment the source address by offset from where the last single/burst transfer ends. If source address offset < 0 => Decrement the source address by offset from where the last single/burst transfer ends. If source address offset == 0 => The next single/burst source address starts from where the last transfer ends

- ***int32_t DMA_RepeatBlockConfTypeDef::DestAddrOffset***
  Specifies the DMA channel single/burst destination address offset signed value : This parameter can be a value between -8191 and 8191. If destination address offset > 0 => Increment the destination address by offset from where the last single/burst transfer ends. If destination address offset < 0 => Decrement the destination address by offset from where the last single/burst transfer ends. If destination address offset == 0 => The next single/burst destination address starts from where the last transfer ends.
- ***int32_t DMA_RepeatBlockConfTypeDef::BlkSrcAddrOffset***
  Specifies the DMA channel block source address offset signed value : This parameter can be a value between -65535 and 65535. If block source address offset > 0 => Increment the block source address by offset from where the last block ends. If block source address offset < 0 => Decrement the next block source address by offset from where the last block ends. If block source address offset == 0 => the next block source address starts from where the last block ends
- ***int32_t DMA_RepeatBlockConfTypeDef::BlkDestAddrOffset***
  Specifies the DMA channel block destination address offset signed value : This parameter can be a value between -65535 and 65535. If block destination address offset > 0 => Increment the block destination address by offset from where the last block ends. If block destination address offset < 0 => Decrement the next block destination address by offset from where the last block ends. If block destination address offset == 0 => the next block destination address starts from where the last block ends

22.1.4 DMA_NodeConfTypeDef

DMA_NodeConfTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***uint32_t NodeType***
- ***DMA_InitTypeDef Init***
- ***DMA_DataHandlingConfTypeDef DataHandlingConfig***
- ***DMA_TriggerConfTypeDef TriggerConfig***
- ***DMA_RepeatBlockConfTypeDef RepeatBlockConfig***
- ***uint32_t SrcAddress***
- ***uint32_t DstAddress***
- ***uint32_t DataSize***
- ***uint32_t SrcSecure***
- ***uint32_t DestSecure***

Field Documentation

- ***uint32_t DMA_NodeConfTypeDef::NodeType***
  Specifies the DMA channel node type. This parameter can be a value of ***DMAEx_Node_Type***
- ***DMA_InitTypeDef DMA_NodeConfTypeDef::Init***
  Specifies the DMA channel basic configuration
- ***DMA_DataHandlingConfTypeDef DMA_NodeConfTypeDef::DataHandlingConfig***
  Specifies the DMA channel data handling channel configuration
- ***DMA_TriggerConfTypeDef DMA_NodeConfTypeDef::TriggerConfig***
  Specifies the DMA channel trigger configuration
- ***DMA_RepeatBlockConfTypeDef DMA_NodeConfTypeDef::RepeatBlockConfig***
  Specifies the DMA channel repeated block configuration
- ***uint32_t DMA_NodeConfTypeDef::SrcAddress***
  Specifies the source memory address
- ***uint32_t DMA_NodeConfTypeDef::DstAddress***
  Specifies the destination memory address
- ***uint32_t DMA_NodeConfTypeDef::DataSize***
  Specifies the source data size in bytes
- ***uint32_t DMA_NodeConfTypeDef::SrcSecure***
  Specifies the source security attribute
- ***uint32_t DMA_NodeConfTypeDef::DestSecure***
  Specifies the destination security attribute

22.1.5 DMA_NodeTypeDef

DMA_NodeTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***uint32_t LinkRegisters***
- ***uint32_t NodeInfo***

Field Documentation

- ***uint32_t DMA_NodeTypeDef::LinkRegisters[8U]***
  Physical Node register description
- ***uint32_t DMA_NodeTypeDef::NodeInfo***
  Node information

22.1.6 __DMA_QListTypeDef

__DMA_QListTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***DMA_NodeTypeDef * Head***
- ***DMA_NodeTypeDef * FirstCircularNode***
- ***uint32_t NodeNumber***
- ***__IO HAL_DMA_QStateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t Type***

Field Documentation

- ***DMA_NodeTypeDef* __DMA_QListTypeDef::Head***
  Specifies the queue head node
- ***DMA_NodeTypeDef* __DMA_QListTypeDef::FirstCircularNode***
  Specifies the queue first circular node
- ***uint32_t __DMA_QListTypeDef::NodeNumber***
  Specifies the queue node number
- ***__IO HAL_DMA_QStateTypeDef __DMA_QListTypeDef::State***
  Specifies the queue state
- ***__IO uint32_t __DMA_QListTypeDef::ErrorCode***
  Specifies the queue error code
- ***__IO uint32_t __DMA_QListTypeDef::Type***
  Specifies whether the queue is static or dynamic

22.1.7 DMA_NodeInQInfoTypeDef

DMA_NodeInQInfoTypeDef is defined in the stm32h5xx_hal_dma_ex.h

Data Fields

- ***uint32_t cllr_offset***
- ***uint32_t previousnode_addr***
- ***uint32_t currentnode_pos***
- ***uint32_t currentnode_addr***
- ***uint32_t nextnode_addr***

Field Documentation

- ***uint32_t DMA_NodeInQInfoTypeDef::cllr_offset***
- ***uint32_t DMA_NodeInQInfoTypeDef::previousnode_addr***
- ***uint32_t DMA_NodeInQInfoTypeDef::currentnode_pos***
- ***uint32_t DMA_NodeInQInfoTypeDef::currentnode_addr***
- ***uint32_t DMA_NodeInQInfoTypeDef::nextnode_addr***

22.2 DMAEx Firmware driver API description

The following section lists the various functions of the DMAEx library.

22.2.1

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.2 How to use this driver

22.2.3

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.4

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.5 Linked-List Initialization and De-Initialization Functions

22.2.6

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.7

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.8 Linked-List IO Operation Functions

22.2.9

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.10

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.11 Linked-List Management Functions

22.2.12

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.13

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.14 Data handling, repeated block and trigger configuration functions

22.2.15

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.16

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.17 Suspend and resume operation functions

22.2.18

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.19

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.20 Fifo status function

22.2.21

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- ***HAL_DMAEx_GetFifoLevel()***

22.2.22 Detailed description of functions

HAL_DMAEx_List_Init

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Init (DMA_HandleTypeDef *const hdma)

Function description

Initialize the DMA channel in linked-list mode according to the specified parameters in the DMA_InitLinkedListTypeDef and create the associated handle.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_DeInit

Function name

HAL_StatusTypeDef HAL_DMAEx_List_DeInit (DMA_HandleTypeDef *const hdma)

Function description

DeInitialize the DMA channel when it is configured in linked-list mode.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_Start

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Start (DMA_HandleTypeDef *const hdma)

Function description

Start the DMA channel transfer in linked-list mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_Start_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Start_IT (DMA_HandleTypeDef *const hdma)

Function description

Starts the DMA channel transfer in linked-list mode with interrupts enabled (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_BuildNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_BuildNode (DMA_NodeConfTypeDef const *const pNodeConfig, DMA_NodeTypeDef *const pNode)

Function description

Build a DMA channel node according to the specified parameters in the DMA_NodeConfTypeDef.

Parameters

- **pNodeConfig:** : Pointer to a DMA_NodeConfTypeDef structure that contains the configuration information for the specified DMA linked-list Node.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list node registers configurations.

Return values

- **HAL:** status.

Notes

- The DMA linked-list node parameter address should be 32bit aligned and should not exceed the 64 KByte addressable space.

HAL_DMAEx_List_GetNodeConfig

Function name

HAL_StatusTypeDef HAL_DMAEx_List_GetNodeConfig (DMA_NodeConfTypeDef *const pNodeConfig, DMA_NodeTypeDef const *const pNode)

Function description

Get a DMA channel node configuration.

Parameters

- **pNodeConfig:** : Pointer to a DMA_NodeConfTypeDef structure that contains the configuration information for the specified DMA linked-list Node.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pPrevNode, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node in any queue position of linked-list queue according to selecting previous node.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pPrevNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode_Head (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node at the head of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode_Tail (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node at the tail of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNode)

Function description

Remove node from any linked-list queue position.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode_Head (DMA_QListTypeDef *const pQList)

Function description

Remove the head node from linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode_Tail (DMA_QListTypeDef *const pQList)

Function description

Remove the tail node from linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pOldNode, DMA_NodeTypeDef *const pNewNode)

Function description

Replace node in linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pOldNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list old node registers configurations.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode_Head (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Replace the head node of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode_Tail (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Replace the tail node of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ResetQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ResetQ (DMA_QListTypeDef *const pQList)

Function description

Reset the linked-list queue and unlink queue nodes.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ (DMA_QListTypeDef *const pSrcQList, DMA_NodeTypeDef const *const pPrevNode, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue to a destination linked-list queue according to selecting previous node.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pPrevNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ_Head (DMA_QListTypeDef *const pSrcQList, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue at the head of destination queue.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ_Tail (DMA_QListTypeDef *const pSrcQList, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue at the tail of destination queue.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_SetCircularModeConfig

Function name

HAL_StatusTypeDef HAL_DMAEx_List_SetCircularModeConfig (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pFirstCircularNode)

Function description

Set circular mode configuration for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pFirstCircularNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list first circular node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_SetCircularMode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_SetCircularMode (DMA_QListTypeDef *const pQList)

Function description

Set circular mode for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ClearCircularMode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ClearCircularMode (DMA_QListTypeDef *const pQList)

Function description

Clear circular mode for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ConvertQToDynamic

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ConvertQToDynamic (DMA_QListTypeDef *const pQList)

Function description

Convert a linked-list queue to dynamic (Optimized DMA queue execution).

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ConvertQToStatic

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ConvertQToStatic (DMA_QListTypeDef *const pQList)

Function description

Convert a linked-list queue to static (Not optimized DMA queue execution).

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_LinkQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_LinkQ (DMA_HandleTypeDef *const hdma, DMA_QListTypeDef *const pQList)

Function description

Link linked-list queue to a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_UnLinkQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_UnLinkQ (DMA_HandleTypeDef *const hdma)

Function description

Unlink linked-list queue from a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigDataHandling

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigDataHandling (DMA_HandleTypeDef *const hdma, DMA_DataHandlingConfTypeDef const *const pConfigDataHandling)

Function description

Configure the DMA channel data handling according to the specified parameters in the DMA_DataHandlingConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigDataHandling:** : Pointer to a DMA_DataHandlingConfTypeDef structure that contains the data handling configuration.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigTrigger

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigTrigger (DMA_HandleTypeDef *const hdma, DMA_TriggerConfTypeDef const *const pConfigTrigger)

Function description

Configure the DMA channel trigger according to the specified parameters in the DMA_TriggerConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigTrigger:** : Pointer to a DMA_TriggerConfTypeDef structure that contains the trigger configuration.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigRepeatBlock

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigRepeatBlock (DMA_HandleTypeDef *const hdma, DMA_RepeatBlockConfTypeDef const *const pConfigRepeatBlock)

Function description

Configure the DMA channel repeated block according to the specified parameters in the DMA_RepeatBlockConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigRepeatBlock:** : Pointer to a DMA_RepeatBlockConfTypeDef structure that contains the repeated block configuration.

Return values

- **HAL:** status.

HAL_DMAEx_Suspend

Function name

HAL_StatusTypeDef HAL_DMAEx_Suspend (DMA_HandleTypeDef *const hdma)

Function description

Suspend any ongoing DMA channel transfer in polling mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA channel.

Return values

- **HAL:** status.

Notes

- After suspending a DMA channel, a check for wait until the DMA channel is effectively suspended is added. If a channel is suspended while a data transfer is ongoing, the current data will be transferred and the channel will be effectively suspended only after the transfer of this single/burst data is finished.

HAL_DMAEx_Suspend_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_Suspend_IT (DMA_HandleTypeDef *const hdma)

Function description

Suspend any ongoing DMA channel transfer in polling mode (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_Resume

Function name

HAL_StatusTypeDef HAL_DMAEx_Resume (DMA_HandleTypeDef *const hdma)

Function description

Resume any suspended DMA channel transfer.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_GetFifoLevel

Function name

uint32_t HAL_DMAEx_GetFifoLevel (DMA_HandleTypeDef const *const hdma)

Function description

Get and returns the DMA channel FIFO level.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **Returns:** the number of available beats in FIFO.

22.3 DMAEx Firmware driver defines

The following section lists the various define and macros of the module.

22.3.1 DMAEx

DMAEx

DMAEx Data Alignment

DMA_DATA_RIGHTALIGN_ZEROPADDED

If source data width < destination data width => Right aligned padded with 0 up to destination data width

DMA_DATA_RIGHTALIGN_LEFTTRUNC

If source data width > destination data width => Right aligned left Truncated down to destination data width

DMA_DATA_RIGHTALIGN_SIGNEXT

If source data width < destination data width => Right Aligned padded with sign extended up to destination data width

DMA_DATA_LEFTALIGN_RIGHTTRUNC

If source data width > destination data width => Left Aligned Right Truncated down to the destination data width

DMA_DATA_PACK

If source data width < destination data width => Packed at the destination data width (Available only for GPDMA)

DMA_DATA_UNPACK

If source data width > destination data width => Unpacked at the destination data width (Available only for GPDMA)

DMAEx Data Exchange

DMA_EXCHANGE_NONE

No data exchange

DMA_EXCHANGE_DEST_BYTE

Destination Byte exchange when destination data width is > Byte

DMA_EXCHANGE_DEST_HALFWORD

Destination Half-Word exchange when destination data width is > Half-Word

DMA_EXCHANGE_SRC_BYTE

Source Byte endianness exchange when source data width is word

DMAEx LinkedList Mode

DMA_LINKEDLIST_NORMAL

Linear linked-list DMA channel transfer

DMA_LINKEDLIST_CIRCULAR

Circular linked-list DMA channel transfer

DMAEx Linked-List Allocated Port

DMA_LINK_ALLOCATED_PORT0

Link allocated port 0

DMA_LINK_ALLOCATED_PORT1

Link allocated port 1

DMAEx Link Step Mode

DMA_LSM_FULL_EXECUTION

Channel is executed for the full linked-list

DMA_LSM_1LINK_EXECUTION

Channel is executed once for the current LLI

DMAEx Node Type

DMA_GPDMA_LINEAR_NODE

Defines the GPDMA linear addressing node type

DMA_GPDMA_2D_NODE

Defines the GPDMA 2 dimension addressing node type

DMAEx Trigger Mode

DMA_TRIGM_BLOCK_TRANSFER

A block transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_REPEATED_BLOCK_TRANSFER

A repeated block transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_LLI_LINK_TRANSFER

A LLI link transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_SINGLE_BURST_TRANSFER

A single/burst transfer is conditioned by (at least) one hit trigger

DMAEx Trigger Polarity

DMA_TRIG_POLARITY_MASKED

No trigger of the selected DMA request. Masked trigger event

DMA_TRIG_POLARITY_RISING

Trigger of the selected DMA request on the rising edge of the selected trigger event input

DMA_TRIG_POLARITY_FALLING

Trigger of the selected DMA request on the falling edge of the selected trigger event input

DMAEx Trigger Selection

GPDMA1_TRIGGER_EXTI_LINE0

GPDMA1 HW Trigger signal is EXTI_LINE0

GPDMA1_TRIGGER_EXTI_LINE1

GPDMA1 HW Trigger signal is EXTI_LINE1

GPDMA1_TRIGGER_EXTI_LINE2

GPDMA1 HW Trigger signal is EXTI_LINE2

GPDMA1_TRIGGER_EXTI_LINE3

GPDMA1 HW Trigger signal is EXTI_LINE3

GPDMA1_TRIGGER_EXTI_LINE4

GPDMA1 HW Trigger signal is EXTI_LINE4

GPDMA1_TRIGGER_EXTI_LINE5

GPDMA1 HW Trigger signal is EXTI_LINE5

GPDMA1_TRIGGER_EXTI_LINE6

GPDMA1 HW Trigger signal is EXTI_LINE6

GPDMA1_TRIGGER_EXTI_LINE7

GPDMA1 HW Trigger signal is EXTI_LINE7

GPDMA1_TRIGGER_TAMP_TRG1

GPDMA1 HW Trigger signal is TAMP_TRG1

GPDMA1_TRIGGER_TAMP_TRG2

GPDMA1 HW Trigger signal is TAMP_TRG2

GPDMA1_TRIGGER_TAMP_TRG3

GPDMA1 HW Trigger signal is TAMP_TRG3

GPDMA1_TRIGGER_LPTIM1_CH1

GPDMA1 HW Trigger signal is LPTIM1_CH1

GPDMA1_TRIGGER_LPTIM1_CH2

GPDMA1 HW Trigger signal is LPTIM1_CH2

GPDMA1_TRIGGER_LPTIM2_CH1

GPDMA1 HW Trigger signal is LPTIM2_CH1

GPDMA1_TRIGGER_LPTIM2_CH2

GPDMA1 HW Trigger signal is LPTIM2_CH2

GPDMA1_TRIGGER_RTC_ALRA_TRG

GPDMA1 HW Trigger signal is RTC_ALRA_TRG

GPDMA1_TRIGGER_RTC_ALRB_TRG

GPDMA1 HW Trigger signal is RTC_ALRB_TRG

GPDMA1_TRIGGER_RTC_WUT_TRG

GPDMA1 HW Trigger signal is RTC_WUT_TRG

GPDMA1_TRIGGER_GPDMA1_CH0_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH0_TCF

GPDMA1_TRIGGER_GPDMA1_CH1_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH1_TCF

GPDMA1_TRIGGER_GPDMA1_CH2_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH2_TCF

GPDMA1_TRIGGER_GPDMA1_CH3_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH3_TCF

GPDMA1_TRIGGER_GPDMA1_CH4_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH4_TCF

GPDMA1_TRIGGER_GPDMA1_CH5_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH5_TCF

GPDMA1_TRIGGER_GPDMA1_CH6_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH6_TCF

GPDMA1_TRIGGER_GPDMA1_CH7_TCF

GPDMA1 HW Trigger signal is GPDMA1_CH7_TCF

GPDMA1_TRIGGER_GPDMA2_CH0_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH0_TCF

GPDMA1_TRIGGER_GPDMA2_CH1_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH1_TCF

GPDMA1_TRIGGER_GPDMA2_CH2_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH2_TCF

GPDMA1_TRIGGER_GPDMA2_CH3_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH3_TCF

GPDMA1_TRIGGER_GPDMA2_CH4_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH4_TCF

GPDMA1_TRIGGER_GPDMA2_CH5_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH5_TCF

GPDMA1_TRIGGER_GPDMA2_CH6_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH6_TCF

GPDMA1_TRIGGER_GPDMA2_CH7_TCF

GPDMA1 HW Trigger signal is GPDMA2_CH7_TCF

GPDMA1_TRIGGER_TIM2_TRGO

GPDMA1 HW Trigger signal is TIM2_TRGO

GPDMA1_TRIGGER_TIM15_TRGO

GPDMA1 HW Trigger signal is TIM15_TRGO

GPDMA1_TRIGGER_TIM12_TRGO

GPDMA1 HW Trigger signal is TIM12_TRGO

GPDMA1_TRIGGER_LPTIM3_CH1

GPDMA1 HW Trigger signal is LPTIM3_CH1

GPDMA1_TRIGGER_LPTIM3_CH2

GPDMA1 HW Trigger signal is LPTIM3_CH2

GPDMA1_TRIGGER_LPTIM4_AIT

GPDMA1 HW Trigger signal is LPTIM4_AIT

GPDMA1_TRIGGER_LPTIM5_CH1

GPDMA1 HW Trigger signal is LPTIM5_CH1

GPDMA1_TRIGGER_LPTIM5_CH2

GPDMA1 HW Trigger signal is LPTIM5_CH2

GPDMA1_TRIGGER_LPTIM6_CH1

GPDMA1 HW Trigger signal is LPTIM6_CH1

GPDMA1_TRIGGER_LPTIM6_CH2

GPDMA1 HW Trigger signal is LPTIM6_CH2

GPDMA2_TRIGGER_EXTI_LINE0

GPDMA2 HW Trigger signal is EXTI_LINE0

GPDMA2_TRIGGER_EXTI_LINE1

GPDMA2 HW Trigger signal is EXTI_LINE1

GPDMA2_TRIGGER_EXTI_LINE2

GPDMA2 HW Trigger signal is EXTI_LINE2

GPDMA2_TRIGGER_EXTI_LINE3

GPDMA2 HW Trigger signal is EXTI_LINE3

GPDMA2_TRIGGER_EXTI_LINE4

GPDMA2 HW Trigger signal is EXTI_LINE4

GPDMA2_TRIGGER_EXTI_LINE5

GPDMA2 HW Trigger signal is EXTI_LINE5

GPDMA2_TRIGGER_EXTI_LINE6

GPDMA2 HW Trigger signal is EXTI_LINE6

GPDMA2_TRIGGER_EXTI_LINE7

GPDMA2 HW Trigger signal is EXTI_LINE7

GPDMA2_TRIGGER_TAMP_TRG1

GPDMA2 HW Trigger signal is TAMP_TRG1

GPDMA2_TRIGGER_TAMP_TRG2

GPDMA2 HW Trigger signal is TAMP_TRG2

GPDMA2_TRIGGER_TAMP_TRG3

GPDMA2 HW Trigger signal is TAMP_TRG3

GPDMA2_TRIGGER_LPTIM1_CH1

GPDMA2 HW Trigger signal is LPTIM1_CH1

GPDMA2_TRIGGER_LPTIM1_CH2

GPDMA2 HW Trigger signal is LPTIM1_CH2

GPDMA2_TRIGGER_LPTIM2_CH1

GPDMA2 HW Trigger signal is LPTIM2_CH1

GPDMA2_TRIGGER_LPTIM2_CH2

GPDMA2 HW Trigger signal is LPTIM2_CH2

GPDMA2_TRIGGER_RTC_ALRA_TRG

GPDMA2 HW Trigger signal is RTC_ALRA_TRG

GPDMA2_TRIGGER_RTC_ALRB_TRG

GPDMA2 HW Trigger signal is RTC_ALRB_TRG

GPDMA2_TRIGGER_RTC_WUT_TRG

GPDMA2 HW Trigger signal is RTC_WUT_TRG

GPDMA2_TRIGGER_GPDMA1_CH0_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH0_TCF

GPDMA2_TRIGGER_GPDMA1_CH1_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH1_TCF

GPDMA2_TRIGGER_GPDMA1_CH2_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH2_TCF

GPDMA2_TRIGGER_GPDMA1_CH3_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH3_TCF

GPDMA2_TRIGGER_GPDMA1_CH4_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH4_TCF

GPDMA2_TRIGGER_GPDMA1_CH5_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH5_TCF

GPDMA2_TRIGGER_GPDMA1_CH6_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH6_TCF

GPDMA2_TRIGGER_GPDMA1_CH7_TCF

GPDMA2 HW Trigger signal is GPDMA1_CH7_TCF

GPDMA2_TRIGGER_GPDMA2_CH0_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH0_TCF

GPDMA2_TRIGGER_GPDMA2_CH1_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH1_TCF

GPDMA2_TRIGGER_GPDMA2_CH2_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH2_TCF

GPDMA2_TRIGGER_GPDMA2_CH3_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH3_TCF

GPDMA2_TRIGGER_GPDMA2_CH4_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH4_TCF

GPDMA2_TRIGGER_GPDMA2_CH5_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH5_TCF

GPDMA2_TRIGGER_GPDMA2_CH6_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH6_TCF

GPDMA2_TRIGGER_GPDMA2_CH7_TCF

GPDMA2 HW Trigger signal is GPDMA2_CH7_TCF

GPDMA2_TRIGGER_TIM2_TRGO

GPDMA2 HW Trigger signal is TIM2_TRGO

GPDMA2_TRIGGER_TIM15_TRGO

GPDMA2 HW Trigger signal is TIM15_TRGO

GPDMA2_TRIGGER_TIM12_TRGO

GPDMA2 HW Trigger signal is TIM12_TRGO

GPDMA2_TRIGGER_LPTIM3_CH1

GPDMA2 HW Trigger signal is LPTIM3_CH1

GPDMA2_TRIGGER_LPTIM3_CH2

GPDMA2 HW Trigger signal is LPTIM3_CH2

GPDMA2_TRIGGER_LPTIM4_AIT

GPDMA2 HW Trigger signal is LPTIM4_AIT

GPDMA2_TRIGGER_LPTIM5_CH1

GPDMA2 HW Trigger signal is LPTIM5_CH1

GPDMA2_TRIGGER_LPTIM5_CH2

GPDMA2 HW Trigger signal is LPTIM5_CH2

GPDMA2_TRIGGER_LPTIM6_CH1

GPDMA2 HW Trigger signal is LPTIM6_CH1

GPDMA2_TRIGGER_LPTIM6_CH2

GPDMA2 HW Trigger signal is LPTIM6_CH2

23 HAL DTS Generic Driver

23.1 DTS Firmware driver registers structures

23.1.1 DTS_InitTypeDef

DTS_InitTypeDef is defined in the stm32h5xx_hal_dts.h

Data Fields

- ***uint32_t QuickMeasure***
- ***uint32_t RefClock***
- ***uint32_t TriggerInput***
- ***uint32_t SamplingTime***
- ***uint32_t Divider***
- ***uint32_t HighThreshold***
- ***uint32_t LowThreshold***

Field Documentation

- ***uint32_t DTS_InitTypeDef::QuickMeasure***
  Specifies the quick measure option selection of the DTS sensor. This parameter can be a value of ***DTS_Quick_Measurement***
- ***uint32_t DTS_InitTypeDef::RefClock***
  Specifies the reference clock selection of the DTS sensor. This parameter can be a value of ***DTS_Reference_Clock_Selection***
- ***uint32_t DTS_InitTypeDef::TriggerInput***
  Specifies the trigger input of the DTS sensor. This parameter can be a value of ***DTS_TriggerConfig***
- ***uint32_t DTS_InitTypeDef::SamplingTime***
  Specifies the sampling time configuration. This parameter can be a value of ***DTS_Sampling_Time***
- ***uint32_t DTS_InitTypeDef::Divider***
  Specifies the high speed clock divider ratio. This parameter can be a value from 0 to 127
- ***uint32_t DTS_InitTypeDef::HighThreshold***
  Specifies the high threshold of the DTS sensor
- ***uint32_t DTS_InitTypeDef::LowThreshold***
  Specifies the low threshold of the DTS sensor

23.1.2 __DTS_HandleTypeDef

__DTS_HandleTypeDef is defined in the stm32h5xx_hal_dts.h

Data Fields

- ***DTS_TypeDef * Instance***
- ***DTS_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_DTS_StateTypeDef State***

23.2 DTS Firmware driver API description

The following section lists the various functions of the DTS library.

23.2.1 DTS Peripheral features

The STM32h5xx device family integrate one DTS sensor interface that converts the temperature into a square wave which frequency is proportional to the temperature.

- Temperature window comparator feature: The DTS allows defining the high and low threshold that will be used for temperature comparison. If the temperature data is equal or higher than the high threshold, or equal or lower than the low threshold, an interrupt is generated and the corresponding flag.
- Synchronous interrupts: A global interrupt output line is available on the DTS block. The interrupt can be generated at the end of measurement and/or when the measurement result is equal/higher or equal/lower than a predefined threshold.
- Asynchronous wakeup: The DTS block provides an asynchronous interrupt line. It is used only when the LSE is selected as reference clock. This line can generate a signal that wakes up the system from Sleep and stop mode at the end of measurement and/or when the measurement result is equal/higher or equal/lower than a predefined threshold.
- Trigger inputs: The temperature measurement can be triggered either by software or by an external event as well as lowpower timer.
- Measurement modes:
  - Quick measure : measure without a calibration when a high precision is not required.
  - Slow measure : measure with a calibration used when a high precision is required.
- Sampling time: The sampling time can be used to increase temperature measurement precision.
- Prescaler: When a calibration is ongoing, the counter clock must be slower than 1 MHz. This is achieved by the PCLK clock prescaler embedded in the temperature sensor.
- Operating Modes:
  - PCLK only : The temperature sensor registers can be accessed. The interface can consequently be reconfigured and the measurement sequence is performed using PCLK clock.
  - PCLK and LSE : The temperature sensor registers can be accessed. The interface can consequently be reconfigured and the measurement sequence is performed using the LSE clock.
  - LSE only : The registers cannot be accessed. The measurement can be performed using the LSE clock This mode is used to exit from Sleep and stop mode by using hardware triggers and the asynchronous interrupt line.

- Calibration: The temperature sensor must run the calibration prior to any frequency measurement. The calibration is performed automatically when the temperature measurement is triggered except for quick measurement mode.
- Low power modes:
  - Sleep mode: only works in LSE mode.
  - Stop mode: only works in LSE mode.

  ==========

23.2.2 How to use this driver

This driver provides functions to configure and program the DTS instances of STM32H5xx devices. To use the DTS, perform the following steps:

- Initialize the DTS low level resources by implementing the HAL_DTS_MspInit():
  - If required enable the DTS interrupt by configuring and enabling EXTI line in Interrupt mode After that enable the DTS interrupt vector using HAL_NVIC_EnableIRQ() function.
- Configure the DTS using HAL_DTS_Init() function:
  - Select the quick measure option
  - Select the reference clock.
  - Select the trigger input.
  - Select the sampling time.
  - Select the high speed clock ratio divider.
  - Select the low threshold
  - Select the high threshold
- Use HAL_DTS_Start() to enable and start the DTS sensor in polling mode.
- Use HAL_DTS_Start_IT() to enable and start the DTS sensor in interrupt mode.
- Use HAL_DTS_GetTemperature() to get temperature from DTS.
- Use HAL_DTS_Stop() to disable and stop the DTS sensor in polling mode.
- Use HAL_DTS_Stop_IT() to disable and stop the DTS sensor in interrupt mode.
- De-initialize the DTS using HAL_DTS_DeInit() function.

Callback and interrupts

When the compilation flag USE_HAL_DTS_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

- Implement the weak function HAL_DTS_EndCallback() to get a callback at the end of the temperature measurement.
- Implement the weak function HAL_DTS_HighCallback() to get a callback when the temperature exceed the high threshold.
- Implement the weak function HAL_DTS_LowCallback() to get a callback when the temperature go down the low threshold.
- Implement the weak function HAL_DTS_AsyncEndCallback() to get a callback at the end of an asynchronous temperature measurement.
- Implement the weak function HAL_DTS_AsyncHighCallback() to get a callback when the temperature exceed the high threshold in an asynchronous measurement.
- Implement the weak function HAL_DTS_AsyncLowCallback() to get a callback when the temperature go down the low threshold in an asynchronous measurement.

The compilation flag USE_HAL_DTS_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks.

State

The driver permits to get in run time the status of the peripheral.

- Use HAL_DTS_GetState() to get the state of the DTS.

23.2.3 Initialization and de-initialization functions

This section provides functions to initialize and de-initialize DTS

This section contains the following APIs:

- *HAL_DTS_Init()*
- *HAL_DTS_DeInit()*
- *HAL_DTS_MspInit()*
- *HAL_DTS_MspDeInit()*
- *HAL_DTS_RegisterCallback()*
- *HAL_DTS_UnRegisterCallback()*

23.2.4 DTS Start Stop operation functions

This section provides functions allowing to:

- Start a DTS Sensor without interrupt.
- Stop a DTS Sensor without interrupt.
- Start a DTS Sensor with interrupt generation.
- Stop a DTS Sensor with interrupt generation.

This section contains the following APIs:

- *HAL_DTS_Start()*
- *HAL_DTS_Stop()*
- *HAL_DTS_Start_IT()*
- *HAL_DTS_Stop_IT()*
- *HAL_DTS_GetTemperature()*
- *HAL_DTS_IRQHandler()*
- *HAL_DTS_EndCallback()*
- *HAL_DTS_LowCallback()*
- *HAL_DTS_HighCallback()*
- *HAL_DTS_AsyncEndCallback()*
- *HAL_DTS_AsyncLowCallback()*
- *HAL_DTS_AsyncHighCallback()*
- *HAL_DTS_GetState()*

23.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_DTS_GetState()*

23.2.6 Detailed description of functions

HAL_DTS_Init

Function name

HAL_StatusTypeDef HAL_DTS_Init (DTS_HandleTypeDef * hdts)

Function description

Initialize the DTS according to the specified parameters in the DTS_InitTypeDef and initialize the associated handle.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_DeInit

Function name

HAL_StatusTypeDef HAL_DTS_DeInit (DTS_HandleTypeDef * hdts)

Function description

DeInitialize the DTS peripheral.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

Notes

- Deinitialization cannot be performed if the DTS configuration is locked. To unlock the configuration, perform a system reset.

HAL_DTS_MspInit

Function name

void HAL_DTS_MspInit (DTS_HandleTypeDef * hdts)

Function description

Initialize the DTS MSP.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_MspDeInit

Function name

void HAL_DTS_MspDeInit (DTS_HandleTypeDef * hdts)

Function description

DeInitialize the DTS MSP.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DTS_RegisterCallback (DTS_HandleTypeDef * hdts, HAL_DTS_CallbackIDTypeDef CallbackID, pDTS_CallbackTypeDef pCallback)

Function description

Register a user DTS callback to be used instead of the weak predefined callback.

Parameters

- **hdts:** DTS handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_DTS_MEAS_COMPLETE_CB_ID measure complete callback ID.
  - HAL_DTS_ASYNC_MEAS_COMPLETE_CB_ID asynchronous measure complete callback ID.
  - HAL_DTS_LOW_THRESHOLD_CB_ID low threshold detection callback ID.
  - HAL_DTS_ASYNC_LOW_THRESHOLD_CB_ID asynchronous low threshold detection callback ID.
  - HAL_DTS_HIGH_THRESHOLD_CB_ID high threshold detection callback ID.
  - HAL_DTS_ASYNC_HIGH_THRESHOLD_CB_ID asynchronous high threshold detection callback ID.
  - HAL_DTS_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DTS_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_DTS_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DTS_UnRegisterCallback (DTS_HandleTypeDef * hdts, HAL_DTS_CallbackIDTypeDef CallbackID)

Function description

Unregister a user DTS callback.

Parameters

- **hdts:** DTS handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_DTS_MEAS_COMPLETE_CB_ID measure complete callback ID.
  - HAL_DTS_ASYNC_MEAS_COMPLETE_CB_ID asynchronous measure complete callback ID.
  - HAL_DTS_LOW_THRESHOLD_CB_ID low threshold detection callback ID.
  - HAL_DTS_ASYNC_LOW_THRESHOLD_CB_ID asynchronous low threshold detection callback ID.
  - HAL_DTS_HIGH_THRESHOLD_CB_ID high threshold detection callback ID.
  - HAL_DTS_ASYNC_HIGH_THRESHOLD_CB_ID asynchronous high threshold detection callback ID.
  - HAL_DTS_MSPINIT_CB_ID MSP init callback ID.
  - HAL_DTS_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_DTS_Start

Function name

HAL_StatusTypeDef HAL_DTS_Start (DTS_HandleTypeDef * hdts)

Function description

Start the DTS sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_Stop

Function name

HAL_StatusTypeDef HAL_DTS_Stop (DTS_HandleTypeDef * hdts)

Function description

Stop the DTS Sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_GetTemperature

Function name

HAL_StatusTypeDef HAL_DTS_GetTemperature (DTS_HandleTypeDef * hdts, int32_t * Temperature)

Function description

Get temperature from DTS.

Parameters

- **hdts:** DTS handle
- **Temperature:** Temperature in deg C

Return values

- **HAL:** status

Notes

- This function retrieves latest available measure

HAL_DTS_Start_IT

Function name

HAL_StatusTypeDef HAL_DTS_Start_IT (DTS_HandleTypeDef * hdts)

Function description

Enable the interrupt(s) and start the DTS sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_Stop_IT

Function name

HAL_StatusTypeDef HAL_DTS_Stop_IT (DTS_HandleTypeDef * hdts)

Function description

Disable the interrupt(s) and stop the DTS sensor.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** status

HAL_DTS_IRQHandler

Function name

void HAL_DTS_IRQHandler (DTS_HandleTypeDef * hdts)

Function description

DTS sensor IRQ Handler.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_GetState

Function name

HAL_DTS_StateTypeDef HAL_DTS_GetState (const DTS_HandleTypeDef * hdts)

Function description

Return the DTS handle state.

Parameters

- **hdts:** DTS handle

Return values

- **HAL:** state

HAL_DTS_EndCallback

Function name

void HAL_DTS_EndCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor End measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_LowCallback

Function name

void HAL_DTS_LowCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor low threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_HighCallback

Function name

void HAL_DTS_HighCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor high threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_AsyncEndCallback

Function name

void HAL_DTS_AsyncEndCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor asynchronous end measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_AsyncLowCallback

Function name

void HAL_DTS_AsyncLowCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor asynchronous low threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

HAL_DTS_AsyncHighCallback

Function name

void HAL_DTS_AsyncHighCallback (DTS_HandleTypeDef * hdts)

Function description

DTS Sensor asynchronous high threshold measure callback.

Parameters

- **hdts:** DTS handle

Return values

- **None:**

23.3 DTS Firmware driver defines

The following section lists the various define and macros of the module.

23.3.1 DTS

DTS

DTS Exported Macros

__HAL_DTS_RESET_HANDLE_STATE

Description:

- Reset DTS handle state.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- None

__HAL_DTS_ENABLE

Description:

- Enable the specified DTS sensor.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- None

__HAL_DTS_DISABLE

Description:

- Disable the specified DTS sensor.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_ENABLE_IT

Description:

- Enable the DTS EXTI line in interrupt mode.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_DISABLE_IT

Description:

- Disable the DTS EXTI line in interrupt mode.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_ENABLE_EVENT

Description:

- Enable the DTS EXTI Line in event mode.

Return value:

- None

__HAL_DTS_EXTI_WAKEUP_DISABLE_EVENT

Description:

- Disable the DTS EXTI Line in event mode.

Return value:

- None

__HAL_DTS_GET_FLAG

Description:

- Checks whether the specified DTS flag is set or not.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - DTS_FLAG_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_ITL : interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_ITH : interrupt flag for high threshold for DTS1
  - DTS_FLAG_TS1_AITE: asynchronous interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_AITL: asynchronous interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_AITH: asynchronous interrupt flag for high threshold for DTS1
  - DTS_FLAG_TS1_RDY : Ready flag for DTS1

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_DTS_CLEAR_FLAG

Description:

- Clears the specified DTS pending flag.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - DTS_FLAG_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_ITL : interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_ITH : interrupt flag for high threshold for DTS1
  - DTS_FLAG_TS1_AITE: asynchronous interrupt flag for end of measure for DTS1
  - DTS_FLAG_TS1_AITL: asynchronous interrupt flag for low threshold for DTS1
  - DTS_FLAG_TS1_AITH: asynchronous interrupt flag for high threshold for DTS1

Return value:

- None

__HAL_DTS_ENABLE_IT

Description:

- Enable the specified DTS interrupt.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __INTERRUPT__: specifies the DTS interrupt source to enable. This parameter can be one of the following values:
  - DTS_IT_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_ITL : interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_ITH : interrupt flag for high of measure for DTS1
  - DTS_IT_TS1_AITE : asynchronous interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_AITL : asynchronous interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_AITH : asynchronous interrupt flag for high of measure for DTS1

Return value:

- None

__HAL_DTS_DISABLE_IT

Description:

- Disable the specified DTS interrupt.

Parameters:

- __HANDLE__: specifies the DTS Handle.
- __INTERRUPT__: specifies the DTS interrupt source to enable. This parameter can be one of the following values:
  - DTS_IT_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_ITL : interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_ITH : interrupt flag for high of measure for DTS1
  - DTS_IT_TS1_AITE : asynchronous interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_AITL : asynchronous interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_AITH : asynchronous interrupt flag for high of measure for DTS1

Return value:

- None

__HAL_DTS_GET_IT_SOURCE

Description:

- Check whether the specified DTS interrupt source is enabled or not.

Parameters:

- __HANDLE__: DTS handle.
- __INTERRUPT__: DTS interrupt source to check This parameter can be one of the following values:
  - DTS_IT_TS1_ITE : interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_ITL : interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_ITH : interrupt flag for high of measure for DTS1
  - DTS_IT_TS1_AITE : asynchronous interrupt flag for end of measure for DTS1
  - DTS_IT_TS1_AITL : asynchronous interrupt flag for low of measure for DTS1
  - DTS_IT_TS1_AITH : asynchronous interrupt flag for high of measure for DTS1

Return value:

- State: of interruption (SET or RESET)

__HAL_DTS_GET_REFCLK

Description:

- Check whether the specified DTS REFCLK is selected.

Parameters:

- __HANDLE__: DTS handle.
- __REFCLK__: DTS reference clock to check This parameter can be one of the following values:
  - DTS_REFCLKSEL_LSE: Low speed REF clock
  - DTS_REFCLKSEL_PCLK: High speed REF clock

Return value:

- State: of the REF clock tested (SET or RESET)

__HAL_DTS_GET_TRIGGER

Description:

- Get Trigger.

Parameters:

- __HANDLE__: DTS handle.

Return value:

- One: of the following trigger DTS_TRIGGER_HW_NONE : No HW trigger (SW trigger)
  DTS_TRIGGER_LPTIMER1: LPTIMER1 trigger DTS_TRIGGER_LPTIMER2: LPTIMER2 trigger
  DTS_TRIGGER_LPTIMER3: LPTIMER3 trigger DTS_TRIGGER_EXTI13 : EXTI13 trigger

DTS EXTI Lines

DTS_EXTI_LINE_DTS1

EXTI line 50 connected to DTS1 output

DTS Flag Definitions

DTS_FLAG_TS1_ITE

Interrupt flag for end of measure for DTS1

DTS_FLAG_TS1_ITL

Interrupt flag for low threshold for DTS1

DTS_FLAG_TS1_ITH

Interrupt flag for high threshold for DTS1

DTS_FLAG_TS1_AITE

Asynchronous Interrupt flag for end of measure for DTS1

DTS_FLAG_TS1_AITL

Asynchronous Interrupt flag for low threshold for DTS1

DTS_FLAG_TS1_AITH

Asynchronous Interrupt flag for high threshold for DTS1

DTS_FLAG_TS1_RDY

Ready flag for DTS1

DTS Interrupts Definitions

DTS_IT_TS1_ITE

Enable interrupt flag for end of measure for DTS1

DTS_IT_TS1_ITL

Enable interrupt flag for low threshold for DTS1

DTS_IT_TS1_ITH

Enable interrupt flag for high threshold for DTS1

DTS_IT_TS1_AITE

Enable asynchronous interrupt flag for end of measure for DTS1

DTS_IT_TS1_AITL

Enable asynchronous interrupt flag for low threshold for DTS1

DTS_IT_TS1_AITH

Enable asynchronous interrupt flag for high threshold for DTS1

DTS Private macros to check input parameters

IS_DTS_QUICKMEAS

IS_DTS_REFCLK

IS_DTS_TRIGGERINPUT

IS_DTS_THRESHOLD

IS_DTS_DIVIDER_RATIO_NUMBER

IS_DTS_SAMPLINGTIME

DTS Quick Measurement

DTS_QUICKMEAS_ENABLE

Enable the Quick Measure (Measure without calibration)

DTS_QUICKMEAS_DISABLE

Disable the Quick Measure (Measure with calibration)

DTS Reference Clock Selection

DTS_REFCLKSEL_LSE

Low speed REF clock (LSE)

DTS_REFCLKSEL_PCLK

High speed REF clock (PCLK)

DTS Sampling Time

DTS_SMP_TIME_1_CYCLE

1 clock cycle for the sampling time

DTS_SMP_TIME_2_CYCLE

2 clock cycle for the sampling time

DTS_SMP_TIME_3_CYCLE

- ***uint32_t VlanCtrl***
- ***uint32_t InnerVlanTag***
- ***uint32_t InnerVlanCtrl***
- ***void * pData***

Field Documentation

- ***uint32_t ETH_TxPacketConfig::Attributes***
  Tx packet HW features capabilities. This parameter can be a combination of ***ETH_Tx_Packet_Attributes***
- ***uint32_t ETH_TxPacketConfig::Length***
  Total packet length
- ***ETH_BufferTypeDef* ETH_TxPacketConfig::TxBuffer***
  Tx buffers pointers
- ***uint32_t ETH_TxPacketConfig::SrcAddrCtrl***
  Specifies the source address insertion control. This parameter can be a value of ***ETH_Tx_Packet_Source_Addr_Control***
- ***uint32_t ETH_TxPacketConfig::CRCPadCtrl***
  Specifies the CRC and Pad insertion and replacement control. This parameter can be a value of ***ETH_Tx_Packet_CRC_Pad_Control***
- ***uint32_t ETH_TxPacketConfig::ChecksumCtrl***
  Specifies the checksum insertion control. This parameter can be a value of ***ETH_Tx_Packet_Checksum_Control***
- ***uint32_t ETH_TxPacketConfig::MaxSegmentSize***
  Sets TCP maximum segment size only when TCP segmentation is enabled. This parameter can be a value from 0x0 to 0x3FFF
- ***uint32_t ETH_TxPacketConfig::PayloadLen***
  Sets Total payload length only when TCP segmentation is enabled. This parameter can be a value from 0x0 to 0x3FFFF
- ***uint32_t ETH_TxPacketConfig::TCPHeaderLen***
  Sets TCP header length only when TCP segmentation is enabled. This parameter can be a value from 0x5 to 0xF
- ***uint32_t ETH_TxPacketConfig::VlanTag***
  Sets VLAN Tag only when VLAN is enabled. This parameter can be a value from 0x0 to 0xFFFF
- ***uint32_t ETH_TxPacketConfig::VlanCtrl***
  Specifies VLAN Tag insertion control only when VLAN is enabled. This parameter can be a value of ***ETH_Tx_Packet_VLAN_Control***
- ***uint32_t ETH_TxPacketConfig::InnerVlanTag***
  Sets Inner VLAN Tag only when Inner VLAN is enabled. This parameter can be a value from 0x0 to 0x3FFFF
- ***uint32_t ETH_TxPacketConfig::InnerVlanCtrl***
  Specifies Inner VLAN Tag insertion control only when Inner VLAN is enabled. This parameter can be a value of ***ETH_Tx_Packet_Inner_VLAN_Control***

- ***void* ETH_TxPacketConfig::pData***
  Specifies Application packet pointer to save

24.1.5 ETH_TimeStampTypeDef

ETH_TimeStampTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***uint32_t TimeStampLow***
- ***uint32_t TimeStampHigh***

Field Documentation

- ***uint32_t ETH_TimeStampTypeDef::TimeStampLow***
- ***uint32_t ETH_TimeStampTypeDef::TimeStampHigh***

24.1.6 ETH_RxDescListTypeDef

ETH_RxDescListTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***uint32_t RxDesc***
- ***uint32_t ItMode***
- ***uint32_t RxDescIdx***
- ***uint32_t RxDescCnt***
- ***uint32_t RxDataLength***
- ***uint32_t RxBuildDescIdx***
- ***uint32_t RxBuildDescCnt***
- ***uint32_t pRxLastRxDesc***
- ***ETH_TimeStampTypeDef TimeStamp***
- ***void * pRxStart***
- ***void * pRxEnd***

Field Documentation

- ***uint32_t ETH_RxDescListTypeDef::RxDesc[ETH_RX_DESC_CNT]***
- ***uint32_t ETH_RxDescListTypeDef::ItMode***
- ***uint32_t ETH_RxDescListTypeDef::RxDescIdx***
- ***uint32_t ETH_RxDescListTypeDef::RxDescCnt***
- ***uint32_t ETH_RxDescListTypeDef::RxDataLength***
- ***uint32_t ETH_RxDescListTypeDef::RxBuildDescIdx***
- ***uint32_t ETH_RxDescListTypeDef::RxBuildDescCnt***
- ***uint32_t ETH_RxDescListTypeDef::pRxLastRxDesc***
- ***ETH_TimeStampTypeDef ETH_RxDescListTypeDef::TimeStamp***
- ***void* ETH_RxDescListTypeDef::pRxStart***
- ***void* ETH_RxDescListTypeDef::pRxEnd***

24.1.7 ETH_MACConfigTypeDef

ETH_MACConfigTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***uint32_t SourceAddrControl***
- ***FunctionalState ChecksumOffload***
- ***uint32_t InterPacketGapVal***
- ***FunctionalState GiantPacketSizeLimitControl***
- ***FunctionalState Support2KPacket***
- ***FunctionalState CRCStripTypePacket***
- ***FunctionalState AutomaticPadCRCStrip***
- ***FunctionalState Watchdog***

- ***FunctionalState Jabber***
- ***FunctionalState JumboPacket***
- ***uint32_t Speed***
- ***uint32_t DuplexMode***
- ***FunctionalState LoopbackMode***
- ***FunctionalState CarrierSenseBeforeTransmit***
- ***FunctionalState ReceiveOwn***
- ***FunctionalState CarrierSenseDuringTransmit***
- ***FunctionalState RetryTransmission***
- ***uint32_t BackOffLimit***
- ***FunctionalState DeferralCheck***
- ***uint32_t PreambleLength***
- ***FunctionalState UnicastSlowProtocolPacketDetect***
- ***FunctionalState SlowProtocolDetect***
- ***FunctionalState CRCCheckingRxPackets***
- ***uint32_t GiantPacketSizeLimit***
- ***FunctionalState ExtendedInterPacketGap***
- ***uint32_t ExtendedInterPacketGapVal***
- ***FunctionalState ProgrammableWatchdog***
- ***uint32_t WatchdogTimeout***
- ***uint32_t PauseTime***
- ***FunctionalState ZeroQuantaPause***
- ***uint32_t PauseLowThreshold***
- ***FunctionalState TransmitFlowControl***
- ***FunctionalState UnicastPausePacketDetect***
- ***FunctionalState ReceiveFlowControl***
- ***uint32_t TransmitQueueMode***
- ***uint32_t ReceiveQueueMode***
- ***FunctionalState DropTCPIPChecksumErrorPacket***
- ***FunctionalState ForwardRxErrorPacket***
- ***FunctionalState ForwardRxUndersizedGoodPacket***

Field Documentation

- ***uint32_t ETH_MACConfigTypeDef::SourceAddrControl***
  Selects the Source Address Insertion or Replacement Control. This parameter can be a value of ***ETH_Source_Addr_Control***
- ***FunctionalState ETH_MACConfigTypeDef::ChecksumOffload***
  Enables or Disable the checksum checking for received packet payloads TCP, UDP or ICMP headers
- ***uint32_t ETH_MACConfigTypeDef::InterPacketGapVal***
  Sets the minimum IPG between Packet during transmission. This parameter can be a value of ***ETH_Inter_Packet_Gap***
- ***FunctionalState ETH_MACConfigTypeDef::GiantPacketSizeLimitControl***
  Enables or disables the Giant Packet Size Limit Control.
- ***FunctionalState ETH_MACConfigTypeDef::Support2KPacket***
  Enables or disables the IEEE 802.3as Support for 2K length Packets
- ***FunctionalState ETH_MACConfigTypeDef::CRCStripTypePacket***
  Enables or disables the CRC stripping for Type packets.
- ***FunctionalState ETH_MACConfigTypeDef::AutomaticPadCRCStrip***
  Enables or disables the Automatic MAC Pad/CRC Stripping.
- ***FunctionalState ETH_MACConfigTypeDef::Watchdog***
  Enables or disables the Watchdog timer on Rx path.
- ***FunctionalState ETH_MACConfigTypeDef::Jabber***
  Enables or disables Jabber timer on Tx path.

- ***FunctionalState ETH_MACConfigTypeDef::JumboPacket***
  Enables or disables receiving Jumbo Packet When enabled, the MAC allows jumbo packets of 9,018 bytes without reporting a giant packet error
- ***uint32_t ETH_MACConfigTypeDef::Speed***
  Sets the Ethernet speed: 10/100 Mbps. This parameter can be a value of ***ETH_Speed***
- ***uint32_t ETH_MACConfigTypeDef::DuplexMode***
  Selects the MAC duplex mode: Half-Duplex or Full-Duplex mode This parameter can be a value of ***ETH_Duplex_Mode***
- ***FunctionalState ETH_MACConfigTypeDef::LoopbackMode***
  Enables or disables the loopback mode
- ***FunctionalState ETH_MACConfigTypeDef::CarrierSenseBeforeTransmit***
  Enables or disables the Carrier Sense Before Transmission in Full Duplex Mode.
- ***FunctionalState ETH_MACConfigTypeDef::ReceiveOwn***
  Enables or disables the Receive Own in Half Duplex mode.
- ***FunctionalState ETH_MACConfigTypeDef::CarrierSenseDuringTransmit***
  Enables or disables the Carrier Sense During Transmission in the Half Duplex mode
- ***FunctionalState ETH_MACConfigTypeDef::RetryTransmission***
  Enables or disables the MAC retry transmission, when a collision occurs in Half Duplex mode.
- ***uint32_t ETH_MACConfigTypeDef::BackOffLimit***
  Selects the BackOff limit value. This parameter can be a value of ***ETH_Back_Off_Limit***
- ***FunctionalState ETH_MACConfigTypeDef::DeferralCheck***
  Enables or disables the deferral check function in Half Duplex mode.
- ***uint32_t ETH_MACConfigTypeDef::PreambleLength***
  Selects or not the Preamble Length for Transmit packets (Full Duplex mode). This parameter can be a value of ***ETH_Preamble_Length***
- ***FunctionalState ETH_MACConfigTypeDef::UnicastSlowProtocolPacketDetect***
  Enable or disables the Detection of Slow Protocol Packets with unicast address.
- ***FunctionalState ETH_MACConfigTypeDef::SlowProtocolDetect***
  Enable or disables the Slow Protocol Detection.
- ***FunctionalState ETH_MACConfigTypeDef::CRCCheckingRxPackets***
  Enable or disables the CRC Checking for Received Packets.
- ***uint32_t ETH_MACConfigTypeDef::GiantPacketSizeLimit***
  Specifies the packet size that the MAC will declare it as Giant, If it's size is greater than the value programmed in this field in units of bytes This parameter must be a number between Min_Data = 0x618 (1518 byte) and Max_Data = 0x3FFF (32 Kbyte).
- ***FunctionalState ETH_MACConfigTypeDef::ExtendedInterPacketGap***
  Enable or disables the extended inter packet gap.
- ***uint32_t ETH_MACConfigTypeDef::ExtendedInterPacketGapVal***
  Sets the Extended IPG between Packet during transmission. This parameter can be a value from 0x0 to 0xFF
- ***FunctionalState ETH_MACConfigTypeDef::ProgrammableWatchdog***
  Enable or disables the Programmable Watchdog.
- ***uint32_t ETH_MACConfigTypeDef::WatchdogTimeout***
  This field is used as watchdog timeout for a received packet This parameter can be a value of ***ETH_Watchdog_Timeout***
- ***uint32_t ETH_MACConfigTypeDef::PauseTime***
  This field holds the value to be used in the Pause Time field in the transmit control packet. This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xFFFF.
- ***FunctionalState ETH_MACConfigTypeDef::ZeroQuantaPause***
  Enable or disables the automatic generation of Zero Quanta Pause Control packets.
- ***uint32_t ETH_MACConfigTypeDef::PauseLowThreshold***
  This field configures the threshold of the PAUSE to be checked for automatic retransmission of PAUSE Packet. This parameter can be a value of ***ETH_Pause_Low_Threshold***
- ***FunctionalState ETH_MACConfigTypeDef::TransmitFlowControl***
  Enables or disables the MAC to transmit Pause packets in Full Duplex mode or the MAC back pressure operation in Half Duplex mode

- ***FunctionalState ETH_MACConfigTypeDef::UnicastPausePacketDetect***
  Enables or disables the MAC to detect Pause packets with unicast address of the station
- ***FunctionalState ETH_MACConfigTypeDef::ReceiveFlowControl***
  Enables or disables the MAC to decodes the received Pause packet and disables its transmitter for a specified (Pause) time
- ***uint32_t ETH_MACConfigTypeDef::TransmitQueueMode***
  Specifies the Transmit Queue operating mode. This parameter can be a value of ***ETH_Transmit_Mode***
- ***uint32_t ETH_MACConfigTypeDef::ReceiveQueueMode***
  Specifies the Receive Queue operating mode. This parameter can be a value of ***ETH_Receive_Mode***
- ***FunctionalState ETH_MACConfigTypeDef::DropTCPIPChecksumErrorPacket***
  Enables or disables Dropping of TCPIP Checksum Error Packets.
- ***FunctionalState ETH_MACConfigTypeDef::ForwardRxErrorPacket***
  Enables or disables forwarding Error Packets.
- ***FunctionalState ETH_MACConfigTypeDef::ForwardRxUndersizedGoodPacket***
  Enables or disables forwarding Undersized Good Packets.

24.1.8 ETH_DMAConfigTypeDef

ETH_DMAConfigTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***uint32_t DMAArbitration***
- ***FunctionalState AddressAlignedBeats***
- ***uint32_t BurstMode***
- ***FunctionalState RebuildINCRxBurst***
- ***FunctionalState PBLx8Mode***
- ***uint32_t TxDMABurstLength***
- ***FunctionalState SecondPacketOperate***
- ***uint32_t RxDMABurstLength***
- ***FunctionalState FlushRxPacket***
- ***FunctionalState TCPSegmentation***
- ***uint32_t MaximumSegmentSize***

Field Documentation

- ***uint32_t ETH_DMAConfigTypeDef::DMAArbitration***
  Sets the arbitration scheme between DMA Tx and Rx This parameter can be a value of ***ETH_DMA_Arbitration***
- ***FunctionalState ETH_DMAConfigTypeDef::AddressAlignedBeats***
  Enables or disables the AHB Master interface address aligned burst transfers on Read and Write channels
- ***uint32_t ETH_DMAConfigTypeDef::BurstMode***
  Sets the AHB Master interface burst transfers. This parameter can be a value of ***ETH_Burst_Mode***
- ***FunctionalState ETH_DMAConfigTypeDef::RebuildINCRxBurst***
  Enables or disables the AHB Master to rebuild the pending beats of any initiated burst transfer with INCRx and SINGLE transfers.
- ***FunctionalState ETH_DMAConfigTypeDef::PBLx8Mode***
  Enables or disables the PBL multiplication by eight.
- ***uint32_t ETH_DMAConfigTypeDef::TxDMABurstLength***
  Indicates the maximum number of beats to be transferred in one Tx DMA transaction. This parameter can be a value of ***ETH_Tx_DMA_Burst_Length***
- ***FunctionalState ETH_DMAConfigTypeDef::SecondPacketOperate***
  Enables or disables the Operate on second Packet mode, which allows the DMA to process a second Packet of Transmit data even before obtaining the status for the first one.
- ***uint32_t ETH_DMAConfigTypeDef::RxDMABurstLength***
  Indicates the maximum number of beats to be transferred in one Rx DMA transaction. This parameter can be a value of ***ETH_Rx_DMA_Burst_Length***
- ***FunctionalState ETH_DMAConfigTypeDef::FlushRxPacket***
  Enables or disables the Rx Packet Flush

- ***FunctionalState ETH_DMAConfigTypeDef::TCPSegmentation***
  Enables or disables the TCP Segmentation
- ***uint32_t ETH_DMAConfigTypeDef::MaximumSegmentSize***
  Sets the maximum segment size that should be used while segmenting the packet This parameter can be a value from 0x40 to 0x3FFF

24.1.9 ETH_InitTypeDef

ETH_InitTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***uint8_t * MACAddr***
- ***ETH_MediaInterfaceTypeDef MediaInterface***
- ***ETH_DMADescTypeDef * TxDesc***
- ***ETH_DMADescTypeDef * RxDesc***
- ***uint32_t RxBuffLen***

Field Documentation

- ***uint8_t* ETH_InitTypeDef::MACAddr***
  MAC Address of used Hardware: must be pointer on an array of 6 bytes
- ***ETH_MediaInterfaceTypeDef ETH_InitTypeDef::MediaInterface***
  Selects the MII interface or the RMII interface.
- ***ETH_DMADescTypeDef* ETH_InitTypeDef::TxDesc***
  Provides the address of the first DMA Tx descriptor in the list
- ***ETH_DMADescTypeDef* ETH_InitTypeDef::RxDesc***
  Provides the address of the first DMA Rx descriptor in the list
- ***uint32_t ETH_InitTypeDef::RxBuffLen***
  Provides the length of Rx buffers size

24.1.10 __ETH_HandleTypeDef

__ETH_HandleTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***ETH_TypeDef * Instance***
- ***ETH_InitTypeDef Init***
- ***ETH_TxDescListTypeDef TxDescList***
- ***ETH_RxDescListTypeDef RxDescList***
- ***__IO HAL_ETH_StateTypeDef gState***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t DMAErrorCode***
- ***__IO uint32_t MACErrorCode***
- ***__IO uint32_t MACWakeUpEvent***
- ***__IO uint32_t MACLPIEvent***
- ***__IO uint32_t IsPtpConfigured***
- ***void(* TxCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* PMTCallback***
- ***void(* EEECallback***
- ***void(* WakeUpCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***pETH_rxAllocateCallbackTypeDef rxAllocateCallback***
- ***pETH_rxLinkCallbackTypeDef rxLinkCallback***
- ***pETH_txFreeCallbackTypeDef txFreeCallback***
- ***pETH_txPtpCallbackTypeDef txPtpCallback***

Field Documentation

- ***ETH_TypeDef* __ETH_HandleTypeDef::Instance***
  Register base address
- ***ETH_InitTypeDef __ETH_HandleTypeDef::Init***
  Ethernet Init Configuration
- ***ETH_TxDescListTypeDef __ETH_HandleTypeDef::TxDescList***
  Tx descriptor wrapper: holds all Tx descriptors list addresses and current descriptor index
- ***ETH_RxDescListTypeDef __ETH_HandleTypeDef::RxDescList***
  Rx descriptor wrapper: holds all Rx descriptors list addresses and current descriptor index
- ***__IO HAL_ETH_StateTypeDef __ETH_HandleTypeDef::gState***
  ETH state information related to global Handle management and also related to Tx operations. This parameter can be a value of ***ETH_State_Codes***
- ***__IO uint32_t __ETH_HandleTypeDef::ErrorCode***
  Holds the global Error code of the ETH HAL status machine This parameter can be a value of ***ETH_Error_Code***.
- ***__IO uint32_t __ETH_HandleTypeDef::DMAErrorCode***
  Holds the DMA Rx Tx Error code when a DMA AIS interrupt occurs This parameter can be a combination of ***ETH_DMA_Status_Flags***
- ***__IO uint32_t __ETH_HandleTypeDef::MACErrorCode***
  Holds the MAC Rx Tx Error code when a MAC Rx or Tx status interrupt occurs This parameter can be a combination of ***ETH_MAC_Rx_Tx_Status***
- ***__IO uint32_t __ETH_HandleTypeDef::MACWakeUpEvent***
  Holds the Wake Up event when the MAC exit the power down mode This parameter can be a value of ***ETH_MAC_Wake_Up_Event***
- ***__IO uint32_t __ETH_HandleTypeDef::MACLPIEvent***
  Holds the LPI event when the an LPI status interrupt occurs. This parameter can be a value of ***ETHEx_LPI_Event***
- ***__IO uint32_t __ETH_HandleTypeDef::IsPtpConfigured***
  Holds the PTP configuration status. This parameter can be a value of ***ETH_PTP_Config_Status***
- ***void(* __ETH_HandleTypeDef::TxCpltCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Tx Complete Callback
- ***void(* __ETH_HandleTypeDef::RxCpltCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Rx Complete Callback
- ***void(* __ETH_HandleTypeDef::ErrorCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Error Callback
- ***void(* __ETH_HandleTypeDef::PMTCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Power Management Callback
- ***void(* __ETH_HandleTypeDef::EEECallback)(struct __ETH_HandleTypeDef *heth)***
  ETH EEE Callback
- ***void(* __ETH_HandleTypeDef::WakeUpCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Wake UP Callback
- ***void(* __ETH_HandleTypeDef::MspInitCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Msp Init callback
- ***void(* __ETH_HandleTypeDef::MspDeInitCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Msp DeInit callback
- ***pETH_rxAllocateCallbackTypeDef __ETH_HandleTypeDef::rxAllocateCallback***
  ETH Rx Get Buffer Function
- ***pETH_rxLinkCallbackTypeDef __ETH_HandleTypeDef::rxLinkCallback***
  ETH Rx Set App Data Function
- ***pETH_txFreeCallbackTypeDef __ETH_HandleTypeDef::txFreeCallback***
  ETH Tx Free Function
- ***pETH_txPtpCallbackTypeDef __ETH_HandleTypeDef::txPtpCallback***
  ETH Tx Handle Ptp Function

24.1.11 ETH_MACFilterConfigTypeDef

ETH_MACFilterConfigTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***FunctionalState PromiscuousMode***
- ***FunctionalState ReceiveAllMode***
- ***FunctionalState HachOrPerfectFilter***
- ***FunctionalState HashUnicast***
- ***FunctionalState HashMulticast***
- ***FunctionalState PassAllMulticast***
- ***FunctionalState SrcAddrFiltering***
- ***FunctionalState SrcAddrInverseFiltering***
- ***FunctionalState DestAddrInverseFiltering***
- ***FunctionalState BroadcastFilter***
- ***uint32_t ControlPacketsFilter***

Field Documentation

- ***FunctionalState ETH_MACFilterConfigTypeDef::PromiscuousMode***
  Enable or Disable Promiscuous Mode
- ***FunctionalState ETH_MACFilterConfigTypeDef::ReceiveAllMode***
  Enable or Disable Receive All Mode
- ***FunctionalState ETH_MACFilterConfigTypeDef::HachOrPerfectFilter***
  Enable or Disable Perfect filtering in addition to Hash filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::HashUnicast***
  Enable or Disable Hash filtering on unicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::HashMulticast***
  Enable or Disable Hash filtering on multicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::PassAllMulticast***
  Enable or Disable passing all multicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::SrcAddrFiltering***
  Enable or Disable source address filtering module
- ***FunctionalState ETH_MACFilterConfigTypeDef::SrcAddrInverseFiltering***
  Enable or Disable source address inverse filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::DestAddrInverseFiltering***
  Enable or Disable destination address inverse filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::BroadcastFilter***
  Enable or Disable broadcast filter
- ***uint32_t ETH_MACFilterConfigTypeDef::ControlPacketsFilter***
  Set the control packets filter This parameter can be a value of ***ETH_Control_Packets_Filter***

24.1.12 ETH_PowerDownConfigTypeDef

ETH_PowerDownConfigTypeDef is defined in the stm32h5xx_hal_eth.h

Data Fields

- ***FunctionalState WakeUpPacket***
- ***FunctionalState MagicPacket***
- ***FunctionalState GlobalUnicast***
- ***FunctionalState WakeUpForward***

Field Documentation

- ***FunctionalState ETH_PowerDownConfigTypeDef::WakeUpPacket***
  Enable or Disable Wake up packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::MagicPacket***
  Enable or Disable Magic packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::GlobalUnicast***
  Enable or Disable Global unicast packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::WakeUpForward***
  Enable or Disable Forwarding Wake up packets

24.2 ETH Firmware driver API description

The following section lists the various functions of the ETH library.

24.2.1 How to use this driver

The ETH HAL driver can be used as follows:

1. Declare a ETH_HandleTypeDef handle structure, for example: ETH_HandleTypeDef heth;
2. Fill parameters of Init structure in heth handle
3. Call HAL_ETH_Init() API to initialize the Ethernet peripheral (MAC, DMA, ...)
4. Initialize the ETH low level resources through the HAL_ETH_MspInit() API:
   a. Enable the Ethernet interface clock using
      - __HAL_RCC_ETH1MAC_CLK_ENABLE()
      - __HAL_RCC_ETH1TX_CLK_ENABLE()
      - __HAL_RCC_ETH1RX_CLK_ENABLE()
   b. Initialize the related GPIO clocks
   c. Configure Ethernet pinout
   d. Configure Ethernet NVIC interrupt (in Interrupt mode)
5. Ethernet data reception is asynchronous, so call the following API to start the listening mode:
   a. HAL_ETH_Start(): This API starts the MAC and DMA transmission and reception process, without enabling end of transfer interrupts, in this mode user has to poll for data reception by calling HAL_ETH_ReadData()
   b. HAL_ETH_Start_IT(): This API starts the MAC and DMA transmission and reception process, end of transfer interrupts are enabled in this mode, HAL_ETH_RxCpltCallback() will be executed when an Ethernet packet is received
6. When data is received user can call the following API to get received data:
   a. HAL_ETH_ReadData(): Read a received packet
7. For transmission path, two APIs are available:
   a. HAL_ETH_Transmit(): Transmit an ETH frame in blocking mode
   b. HAL_ETH_Transmit_IT(): Transmit an ETH frame in interrupt mode, HAL_ETH_TxCpltCallback() will be executed when end of transfer occur
8. Communication with an external PHY device:
   a. HAL_ETH_ReadPHYRegister(): Read a register from an external PHY
   b. HAL_ETH_WritePHYRegister(): Write data to an external RHY register
9. Configure the Ethernet MAC after ETH peripheral initialization
   a. HAL_ETH_GetMACConfig(): Get MAC actual configuration into ETH_MACConfigTypeDef
   b. HAL_ETH_SetMACConfig(): Set MAC configuration based on ETH_MACConfigTypeDef
10. Configure the Ethernet DMA after ETH peripheral initialization
    a. HAL_ETH_GetDMAConfig(): Get DMA actual configuration into ETH_DMAConfigTypeDef
    b. HAL_ETH_SetDMAConfig(): Set DMA configuration based on ETH_DMAConfigTypeDef
11. Configure the Ethernet PTP after ETH peripheral initialization
    a. Define HAL_ETH_USE_PTP to use PTP APIs.
    b. HAL_ETH_PTP_GetConfig(): Get PTP actual configuration into ETH_PTP_ConfigTypeDef
    c. HAL_ETH_PTP_SetConfig(): Set PTP configuration based on ETH_PTP_ConfigTypeDef
    d. HAL_ETH_PTP_GetTime(): Get Seconds and Nanoseconds for the Ethernet PTP registers
    e. HAL_ETH_PTP_SetTime(): Set Seconds and Nanoseconds for the Ethernet PTP registers
    f. HAL_ETH_PTP_AddTimeOffset(): Add Seconds and Nanoseconds offset for the Ethernet PTP registers
    g. HAL_ETH_PTP_InsertTxTimestamp(): Insert Timestamp in transmission
    h. HAL_ETH_PTP_GetTxTimestamp(): Get transmission timestamp
    i. HAL_ETH_PTP_GetRxTimestamp(): Get reception timestamp -@- The ARP offload feature is not supported in this driver. -@- The PTP offload feature is not supported in this driver.

Callback registration

24.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize and deinitialize the ETH peripheral:

- User must Implement HAL_ETH_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO and NVIC).
- Call the function HAL_ETH_Init() to configure the selected device with the selected configuration:
  - MAC address
  - Media interface (MII or RMII)
  - Rx DMA Descriptors Tab
  - Tx DMA Descriptors Tab
  - Length of Rx Buffers
- Call the function HAL_ETH_DeInit() to restore the default configuration of the selected ETH peripheral.

This section contains the following APIs:

- ***HAL_ETH_Init()***
- ***HAL_ETH_DeInit()***
- ***HAL_ETH_MspInit()***
- ***HAL_ETH_MspDeInit()***
- ***HAL_ETH_RegisterCallback()***
- ***HAL_ETH_UnRegisterCallback()***

24.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the ETH data transfer.

This section contains the following APIs:

- ***HAL_ETH_Start()***
- ***HAL_ETH_Start_IT()***
- ***HAL_ETH_Stop()***
- ***HAL_ETH_Stop_IT()***
- ***HAL_ETH_Transmit()***
- ***HAL_ETH_Transmit_IT()***
- ***HAL_ETH_ReadData()***
- ***HAL_ETH_RegisterRxAllocateCallback()***
- ***HAL_ETH_UnRegisterRxAllocateCallback()***
- ***HAL_ETH_RxAllocateCallback()***
- ***HAL_ETH_RxLinkCallback()***
- ***HAL_ETH_RegisterRxLinkCallback()***
- ***HAL_ETH_UnRegisterRxLinkCallback()***
- ***HAL_ETH_GetRxDataErrorCode()***
- ***HAL_ETH_RegisterTxFreeCallback()***
- ***HAL_ETH_UnRegisterTxFreeCallback()***
- ***HAL_ETH_TxFreeCallback()***
- ***HAL_ETH_ReleaseTxPacket()***
- ***HAL_ETH_IRQHandler()***
- ***HAL_ETH_TxCpltCallback()***
- ***HAL_ETH_RxCpltCallback()***
- ***HAL_ETH_ErrorCallback()***
- ***HAL_ETH_PMTCallback()***
- ***HAL_ETH_EEECallback()***
- ***HAL_ETH_WakeUpCallback()***

- *HAL_ETH_ReadPHYRegister()*
- *HAL_ETH_WritePHYRegister()*
- *HAL_ETH_TxPtpCallback()*

24.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the ETH peripheral.

This section contains the following APIs:

- *HAL_ETH_GetMACConfig()*
- *HAL_ETH_GetDMAConfig()*
- *HAL_ETH_SetMACConfig()*
- *HAL_ETH_SetDMAConfig()*
- *HAL_ETH_SetMDIOClockRange()*
- *HAL_ETH_SetMACFilterConfig()*
- *HAL_ETH_GetMACFilterConfig()*
- *HAL_ETH_SetSourceMACAddrMatch()*
- *HAL_ETH_SetHashTable()*
- *HAL_ETH_SetRxVLANIdentifier()*
- *HAL_ETH_EnterPowerDownMode()*
- *HAL_ETH_ExitPowerDownMode()*
- *HAL_ETH_SetWakeUpFilter()*

24.2.5 Peripheral State and Errors functions

This subsection provides a set of functions allowing to return the State of ETH communication process, return Peripheral Errors occurred during communication process

This section contains the following APIs:

- *HAL_ETH_GetState()*
- *HAL_ETH_GetError()*
- *HAL_ETH_GetDMAError()*
- *HAL_ETH_GetMACError()*
- *HAL_ETH_GetMACWakeUpSource()*

24.2.6 Detailed description of functions

HAL_ETH_Init

Function name

HAL_StatusTypeDef HAL_ETH_Init (ETH_HandleTypeDef * heth)

Function description

Initialize the Ethernet peripheral registers.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_DeInit

Function name

HAL_StatusTypeDef HAL_ETH_DeInit (ETH_HandleTypeDef * heth)

Function description

DeInitializes the ETH peripheral.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_MspInit

Function name

void HAL_ETH_MspInit (ETH_HandleTypeDef * heth)

Function description

Initializes the ETH MSP.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_MspDeInit

Function name

void HAL_ETH_MspDeInit (ETH_HandleTypeDef * heth)

Function description

DeInitializes ETH MSP.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_RegisterCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterCallback (ETH_HandleTypeDef * heth, HAL_ETH_CallbackIDTypeDef CallbackID, pETH_CallbackTypeDef pCallback)

Function description

Register a User ETH Callback To be used instead of the weak predefined callback.

Parameters

- **heth:** eth handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_ETH_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_ETH_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_ETH_ERROR_CB_ID Error Callback ID
  - HAL_ETH_PMT_CB_ID Power Management Callback ID
  - HAL_ETH_EEE_CB_ID EEE Callback ID
  - HAL_ETH_WAKEUP_CB_ID Wake UP Callback ID
  - HAL_ETH_MSPINIT_CB_ID MspInit callback ID
  - HAL_ETH_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_ETH_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterCallback (ETH_HandleTypeDef * heth, HAL_ETH_CallbackIDTypeDef CallbackID)

Function description

Unregister an ETH Callback ETH callback is redirected to the weak predefined callback.

Parameters

- **heth:** eth handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_ETH_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_ETH_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_ETH_ERROR_CB_ID Error Callback ID
  - HAL_ETH_PMT_CB_ID Power Management Callback ID
  - HAL_ETH_EEE_CB_ID EEE Callback ID
  - HAL_ETH_WAKEUP_CB_ID Wake UP Callback ID
  - HAL_ETH_MSPINIT_CB_ID MspInit callback ID
  - HAL_ETH_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_ETH_Start

Function name

HAL_StatusTypeDef HAL_ETH_Start (ETH_HandleTypeDef * heth)

Function description

Enables Ethernet MAC and DMA reception and transmission.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Start_IT

Function name

HAL_StatusTypeDef HAL_ETH_Start_IT (ETH_HandleTypeDef * heth)

Function description

Enables Ethernet MAC and DMA reception/transmission in Interrupt mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Stop

Function name

HAL_StatusTypeDef HAL_ETH_Stop (ETH_HandleTypeDef * heth)

Function description

Stop Ethernet MAC and DMA reception/transmission.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Stop_IT

Function name

HAL_StatusTypeDef HAL_ETH_Stop_IT (ETH_HandleTypeDef * heth)

Function description

Stop Ethernet MAC and DMA reception/transmission in Interrupt mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_ReadData

Function name

HAL_StatusTypeDef HAL_ETH_ReadData (ETH_HandleTypeDef * heth, void ** pAppBuff)

Function description

Read a received packet.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pAppBuff:** Pointer to an application buffer to receive the packet.

Return values

- **HAL:** status

HAL_ETH_RegisterRxAllocateCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterRxAllocateCallback (ETH_HandleTypeDef * heth, pETH_rxAllocateCallbackTypeDef rxAllocateCallback)

Function description

Register the Rx alloc callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **rxAllocateCallback:** pointer to function to alloc buffer

Return values

- **HAL:** status

HAL_ETH_UnRegisterRxAllocateCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterRxAllocateCallback (ETH_HandleTypeDef * heth)

Function description

Unregister the Rx alloc callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_RegisterRxLinkCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterRxLinkCallback (ETH_HandleTypeDef * heth, pETH_rxLinkCallbackTypeDef rxLinkCallback)

Function description

Set the Rx link data function.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **rxLinkCallback:** pointer to function to link data

Return values

- **HAL:** status

HAL_ETH_UnRegisterRxLinkCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterRxLinkCallback (ETH_HandleTypeDef * heth)

Function description

Unregister the Rx link callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_GetRxDataErrorCode

Function name

HAL_StatusTypeDef HAL_ETH_GetRxDataErrorCode (ETH_HandleTypeDef * heth, uint32_t * pErrorCode)

Function description

Get the error state of the last received packet.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pErrorCode:** pointer to uint32_t to hold the error code

Return values

- **HAL:** status

HAL_ETH_RegisterTxFreeCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterTxFreeCallback (ETH_HandleTypeDef * heth, pETH_txFreeCallbackTypeDef txFreeCallback)

Function description

Set the Tx free function.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **txFreeCallback:** pointer to function to release the packet

Return values

- **HAL:** status

HAL_ETH_UnRegisterTxFreeCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterTxFreeCallback (ETH_HandleTypeDef * heth)

Function description

Unregister the Tx free callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_ReleaseTxPacket

Function name

HAL_StatusTypeDef HAL_ETH_ReleaseTxPacket (ETH_HandleTypeDef * heth)

Function description

Release transmitted Tx packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_Transmit

Function name

HAL_StatusTypeDef HAL_ETH_Transmit (ETH_HandleTypeDef * heth, ETH_TxPacketConfig * pTxConfig, uint32_t Timeout)

Function description

Sends an Ethernet Packet in polling mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pTxConfig:** Hold the configuration of packet to be transmitted
- **Timeout:** timeout value

Return values

- **HAL:** status

HAL_ETH_Transmit_IT

Function name

HAL_StatusTypeDef HAL_ETH_Transmit_IT (ETH_HandleTypeDef * heth, ETH_TxPacketConfig * pTxConfig)

Function description

Sends an Ethernet Packet in interrupt mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pTxConfig:** Hold the configuration of packet to be transmitted

Return values

- **HAL:** status

HAL_ETH_WritePHYRegister

Function name

HAL_StatusTypeDef HAL_ETH_WritePHYRegister (const ETH_HandleTypeDef * heth, uint32_t PHYAddr, uint32_t PHYReg, uint32_t RegValue)

Function description

Writes to a PHY register.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **PHYAddr:** PHY port address, must be a value from 0 to 31
- **PHYReg:** PHY register address, must be a value from 0 to 31
- **RegValue:** the value to write

Return values

- **HAL:** status

HAL_ETH_ReadPHYRegister

Function name

HAL_StatusTypeDef HAL_ETH_ReadPHYRegister (ETH_HandleTypeDef * heth, uint32_t PHYAddr, uint32_t PHYReg, uint32_t * pRegValue)

Function description

Read a PHY register.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **PHYAddr:** PHY port address, must be a value from 0 to 31
- **PHYReg:** PHY register address, must be a value from 0 to 31
- **pRegValue:** parameter to hold read value

Return values

- **HAL:** status

HAL_ETH_IRQHandler

Function name

void HAL_ETH_IRQHandler (ETH_HandleTypeDef * heth)

Function description

This function handles ETH interrupt request.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** status

HAL_ETH_TxCpltCallback

Function name

void HAL_ETH_TxCpltCallback (ETH_HandleTypeDef * heth)

Function description

Tx Transfer completed callbacks.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_RxCpltCallback

Function name

void HAL_ETH_RxCpltCallback (ETH_HandleTypeDef * heth)

Function description

Rx Transfer completed callbacks.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_ErrorCallback

Function name

void HAL_ETH_ErrorCallback (ETH_HandleTypeDef * heth)

Function description

Ethernet transfer error callbacks.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_PMTCallback

Function name

void HAL_ETH_PMTCallback (ETH_HandleTypeDef * heth)

Function description

Ethernet Power Management module IT callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_EEECallback

Function name

void HAL_ETH_EEECallback (ETH_HandleTypeDef * heth)

Function description

Energy Efficient Etherent IT callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_WakeUpCallback

Function name

void HAL_ETH_WakeUpCallback (ETH_HandleTypeDef * heth)

Function description

ETH WAKEUP interrupt callback.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_RxAllocateCallback

Function name

void HAL_ETH_RxAllocateCallback (uint8_t ** buff)

Function description

Rx Allocate callback.

Parameters

- **buff:** pointer to allocated buffer

Return values

- **None:**

HAL_ETH_RxLinkCallback

Function name

void HAL_ETH_RxLinkCallback (void ** pStart, void ** pEnd, uint8_t * buff, uint16_t Length)

Function description

Rx Link callback.

Parameters

- **pStart:** pointer to packet start
- **pEnd:** pointer to packet end
- **buff:** pointer to received data
- **Length:** received data length

Return values

- **None:**

HAL_ETH_TxFreeCallback

Function name

void HAL_ETH_TxFreeCallback (uint32_t * buff)

Function description

Tx Free callback.

Parameters

- **buff:** pointer to buffer to free

Return values

- **None:**

HAL_ETH_TxPtpCallback

Function name

void HAL_ETH_TxPtpCallback (uint32_t * buff, ETH_TimeStampTypeDef * timestamp)

Function description

HAL_ETH_GetMACConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetMACConfig (ETH_HandleTypeDef * heth, ETH_MACConfigTypeDef * macconf)

Function description

Get the configuration of the MAC and MTL subsystems.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **macconf:** pointer to a ETH_MACConfigTypeDef structure that will hold the configuration of the MAC.

Return values

- **HAL:** Status

HAL_ETH_GetDMAConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetDMAConfig (ETH_HandleTypeDef * heth, ETH_DMAConfigTypeDef * dmaconf)

Function description

Get the configuration of the DMA.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **dmaconf:** pointer to a ETH_DMAConfigTypeDef structure that will hold the configuration of the ETH DMA.

Return values

- **HAL:** Status

HAL_ETH_SetMACConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetMACConfig (ETH_HandleTypeDef * heth, ETH_MACConfigTypeDef * macconf)

Function description

Set the MAC configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **macconf:** pointer to a ETH_MACConfigTypeDef structure that contains the configuration of the MAC.

Return values

- **HAL:** status

HAL_ETH_SetDMAConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetDMAConfig (ETH_HandleTypeDef * heth, ETH_DMAConfigTypeDef * dmaconf)

Function description

Set the ETH DMA configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **dmaconf:** pointer to a ETH_DMAConfigTypeDef structure that will hold the configuration of the ETH DMA.

Return values

- **HAL:** status

HAL_ETH_SetMDIOClockRange

Function name

void HAL_ETH_SetMDIOClockRange (ETH_HandleTypeDef * heth)

Function description

Configures the Clock range of ETH MDIO interface.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETH_SetRxVLANIdentifier

Function name

void HAL_ETH_SetRxVLANIdentifier (ETH_HandleTypeDef * heth, uint32_t ComparisonBits, uint32_t VLANIdentifier)

Function description

Set the VLAN Identifier for Rx packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **ComparisonBits:** 12 or 16 bit comparison mode must be a value of ETH VLAN Tag Comparison
- **VLANIdentifier:** VLAN Identifier value

Return values

- **None:**

HAL_ETH_GetMACFilterConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetMACFilterConfig (ETH_HandleTypeDef * heth, ETH_MACFilterConfigTypeDef * pFilterConfig)

Function description

Get the ETH MAC (L2) Filters configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pFilterConfig:** pointer to a ETH_MACFilterConfigTypeDef structure that will hold the configuration of the ETH MAC filters.

Return values

- **HAL:** status

HAL_ETH_SetMACFilterConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetMACFilterConfig (ETH_HandleTypeDef * heth, const ETH_MACFilterConfigTypeDef * pFilterConfig)

Function description

Set the ETH MAC (L2) Filters configuration.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pFilterConfig:** pointer to a ETH_MACFilterConfigTypeDef structure that contains the configuration of the ETH MAC filters.

Return values

- **HAL:** status

HAL_ETH_SetHashTable

Function name

HAL_StatusTypeDef HAL_ETH_SetHashTable (ETH_HandleTypeDef * heth, uint32_t * pHashTable)

Function description

Set the ETH Hash Table Value.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pHashTable:** pointer to a table of two 32 bit values, that contains the 64 bits of the hash table.

Return values

- **HAL:** status

HAL_ETH_SetSourceMACAddrMatch

Function name

HAL_StatusTypeDef HAL_ETH_SetSourceMACAddrMatch (const ETH_HandleTypeDef * heth, uint32_t AddrNbr, const uint8_t * pMACAddr)

Function description

Set the source MAC Address to be matched.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **AddrNbr:** The MAC address to configure This parameter must be a value of the following: ETH_MAC_ADDRESS1 ETH_MAC_ADDRESS2 ETH_MAC_ADDRESS3
- **pMACAddr:** Pointer to MAC address buffer data (6 bytes)

Return values

- **HAL:** status

HAL_ETH_EnterPowerDownMode

Function name

void HAL_ETH_EnterPowerDownMode (ETH_HandleTypeDef * heth, const ETH_PowerDownConfigTypeDef * pPowerDownConfig)

Function description

Enters the Power down mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pPowerDownConfig:** a pointer to ETH_PowerDownConfigTypeDef structure that contains the Power Down configuration

Return values

- **None.:**

HAL_ETH_ExitPowerDownMode

Function name

void HAL_ETH_ExitPowerDownMode (ETH_HandleTypeDef * heth)

Function description

Exits from the Power down mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETH_SetWakeUpFilter

Function name

HAL_StatusTypeDef HAL_ETH_SetWakeUpFilter (ETH_HandleTypeDef * heth, uint32_t * pFilter, uint32_t Count)

Function description

Set the WakeUp filter.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pFilter:** pointer to filter registers values
- **Count:** number of filter registers, must be from 1 to 8.

Return values

- **None.:**

HAL_ETH_GetState

Function name

HAL_ETH_StateTypeDef HAL_ETH_GetState (const ETH_HandleTypeDef * heth)

Function description

Returns the ETH state.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **HAL:** state

HAL_ETH_GetError

Function name

uint32_t HAL_ETH_GetError (const ETH_HandleTypeDef * heth)

Function description

Returns the ETH error code.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** Error Code

HAL_ETH_GetDMAError

Function name

uint32_t HAL_ETH_GetDMAError (const ETH_HandleTypeDef * heth)

Function description

Returns the ETH DMA error code.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** DMA Error Code

HAL_ETH_GetMACError

Function name

uint32_t HAL_ETH_GetMACError (const ETH_HandleTypeDef * heth)

Function description

Returns the ETH MAC error code.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** MAC Error Code

HAL_ETH_GetMACWakeUpSource

Function name

uint32_t HAL_ETH_GetMACWakeUpSource (const ETH_HandleTypeDef * heth)

Function description

Returns the ETH MAC WakeUp event source.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** MAC WakeUp event source

24.3 ETH Firmware driver defines

ETH Exported Macros

__HAL_ETH_RESET_HANDLE_STATE

Description:

- Reset ETH handle state.

Parameters:

- __HANDLE__: specifies the ETH handle.

Return value:

- None

__HAL_ETH_DMA_ENABLE_IT

Description:

- Enables the specified ETHERNET DMA interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET DMA interrupt sources to be enabled

Return value:

- None

__HAL_ETH_DMA_DISABLE_IT

Description:

- Disables the specified ETHERNET DMA interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET DMA interrupt sources to be disabled.

Return value:

- None

__HAL_ETH_DMA_GET_IT_SOURCE

Description:

- Gets the ETHERNET DMA IT source enabled or disabled.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: ETH DMA IT Source enabled or disabled

__HAL_ETH_DMA_GET_IT

Description:

- Gets the ETHERNET DMA IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: state of ETH DMA IT (SET or RESET)

__HAL_ETH_DMA_CLEAR_IT

Description:

- Clears the ETHERNET DMA IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt pending bit to clear.

Return value:

- None

__HAL_ETH_DMA_GET_FLAG

Description:

- Checks whether the specified ETHERNET DMA flag is set or not.

Parameters:

- __HANDLE__: ETH Handle
- __FLAG__: specifies the flag to check.

Return value:

- The: state of ETH DMA FLAG (SET or RESET).

__HAL_ETH_DMA_CLEAR_FLAG

Description:

- Clears the specified ETHERNET DMA flag.

Parameters:

- __HANDLE__: ETH Handle
- __FLAG__: specifies the flag to check.

Return value:

- The: state of ETH DMA FLAG (SET or RESET).

__HAL_ETH_MAC_ENABLE_IT

Description:

- Enables the specified ETHERNET MAC interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET MAC interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MAC_DISABLE_IT

Description:

- Disables the specified ETHERNET MAC interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET MAC interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MAC_GET_IT

Description:

- Checks whether the specified ETHERNET MAC flag is set or not.

Parameters:

- __HANDLE__: ETH Handle
- __INTERRUPT__: specifies the flag to check.

Return value:

- The: state of ETH MAC IT (SET or RESET). External interrupt line 46 Connected to the ETH wakeup EXTI Line

ETH_WAKEUP_EXTI_LINE

__HAL_ETH_WAKEUP_EXTI_ENABLE_IT

Description:

- Enable the ETH WAKEUP Exti Line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be enabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTI_GET_FLAG

Description:

- checks whether the specified ETH WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- EXTI: ETH WAKEUP Line Status.

__HAL_ETH_WAKEUP_EXTI_CLEAR_FLAG

Description:

- Clear the ETH WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTI_ENABLE_RISING_EDGE

Description:

- enable rising edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_ENABLE_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

25 HAL ETH Extension Driver

25.1 ETHEx Firmware driver registers structures

25.1.1 ETH_RxVLANConfigTypeDef

ETH_RxVLANConfigTypeDef is defined in the stm32h5xx_hal_eth_ex.h

Data Fields

- ***FunctionalState InnerVLANTagInStatus***
- ***uint32_t StripInnerVLANTag***
- ***FunctionalState InnerVLANTag***
- ***FunctionalState DoubleVLANProcessing***
- ***FunctionalState VLANTagHashTableMatch***
- ***FunctionalState VLANTagInStatus***
- ***uint32_t StripVLANTag***
- ***uint32_t VLANTypeCheck***
- ***FunctionalState VLANTagInverceMatch***

Field Documentation

- ***FunctionalState ETH_RxVLANConfigTypeDef::InnerVLANTagInStatus***
  Enables or disables Inner VLAN Tag in Rx Status
- ***uint32_t ETH_RxVLANConfigTypeDef::StripInnerVLANTag***
  Sets the Inner VLAN Tag Stripping on Receive This parameter can be a value of ***ETHEx_Rx_Inner_VLAN_Tag_Stripping***
- ***FunctionalState ETH_RxVLANConfigTypeDef::InnerVLANTag***
  Enables or disables Inner VLAN Tag
- ***FunctionalState ETH_RxVLANConfigTypeDef::DoubleVLANProcessing***
  Enable or Disable double VLAN processing
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagHashTableMatch***
  Enable or Disable VLAN Tag Hash Table Match
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagInStatus***
  Enable or Disable VLAN Tag in Rx status
- ***uint32_t ETH_RxVLANConfigTypeDef::StripVLANTag***
  Set the VLAN Tag Stripping on Receive This parameter can be a value of ***ETHEx_Rx_VLAN_Tag_Stripping***
- ***uint32_t ETH_RxVLANConfigTypeDef::VLANTypeCheck***
  Enable or Disable VLAN Type Check This parameter can be a value of ***ETHEx_VLAN_Type_Check***
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagInverceMatch***
  Enable or disable VLAN Tag Inverse Match

25.1.2 ETH_TxVLANConfigTypeDef

ETH_TxVLANConfigTypeDef is defined in the stm32h5xx_hal_eth_ex.h

Data Fields

- ***FunctionalState SourceTxDesc***
- ***FunctionalState SVLANType***
- ***uint32_t VLANTagControl***

Field Documentation

- ***FunctionalState ETH_TxVLANConfigTypeDef::SourceTxDesc***
  Enable or Disable VLAN tag source from DMA tx descriptors
- ***FunctionalState ETH_TxVLANConfigTypeDef::SVLANType***
  Enable or Disable insertion of SVLAN type
- ***uint32_t ETH_TxVLANConfigTypeDef::VLANTagControl***
  Sets the VLAN tag control in tx packets This parameter can be a value of ***ETHEx_VLAN_Tag_Control***

25.1.3 ETH_L3FilterConfigTypeDef

ETH_L3FilterConfigTypeDef is defined in the stm32h5xx_hal_eth_ex.h

Data Fields

- ***uint32_t Protocol***
- ***uint32_t SrcAddrFilterMatch***
- ***uint32_t DestAddrFilterMatch***
- ***uint32_t SrcAddrHigherBitsMatch***
- ***uint32_t DestAddrHigherBitsMatch***
- ***uint32_t Ip4SrcAddr***
- ***uint32_t Ip4DestAddr***
- ***uint32_t Ip6Addr***

Field Documentation

- ***uint32_t ETH_L3FilterConfigTypeDef::Protocol***
  Sets the L3 filter protocol to IPv4 or IPv6 This parameter can be a value of ***ETHEx_L3_Protocol***
- ***uint32_t ETH_L3FilterConfigTypeDef::SrcAddrFilterMatch***
  Sets the L3 filter source address match This parameter can be a value of ***ETHEx_L3_Source_Match***
- ***uint32_t ETH_L3FilterConfigTypeDef::DestAddrFilterMatch***
  Sets the L3 filter destination address match This parameter can be a value of ***ETHEx_L3_Destination_Match***
- ***uint32_t ETH_L3FilterConfigTypeDef::SrcAddrHigherBitsMatch***
  Sets the L3 filter source address higher bits match This parameter can be a value from 0 to 31
- ***uint32_t ETH_L3FilterConfigTypeDef::DestAddrHigherBitsMatch***
  Sets the L3 filter destination address higher bits match This parameter can be a value from 0 to 31
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip4SrcAddr***
  Sets the L3 filter IPv4 source address if IPv4 protocol is used This parameter can be a value from 0x0 to 0xFFFFFFFF
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip4DestAddr***
  Sets the L3 filter IPv4 destination address if IPv4 protocol is used This parameter can be a value from 0 to 0xFFFFFFFF
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip6Addr[4]***
  Sets the L3 filter IPv6 address if IPv6 protocol is used This parameter must be a table of 4 words (4* 32 bits)

25.1.4 ETH_L4FilterConfigTypeDef

ETH_L4FilterConfigTypeDef is defined in the stm32h5xx_hal_eth_ex.h

Data Fields

- ***uint32_t Protocol***
- ***uint32_t SrcPortFilterMatch***
- ***uint32_t DestPortFilterMatch***
- ***uint32_t SourcePort***
- ***uint32_t DestinationPort***

Field Documentation

- ***uint32_t ETH_L4FilterConfigTypeDef::Protocol***
  Sets the L4 filter protocol to TCP or UDP This parameter can be a value of ***ETHEx_L4_Protocol***
- ***uint32_t ETH_L4FilterConfigTypeDef::SrcPortFilterMatch***
  Sets the L4 filter source port match This parameter can be a value of ***ETHEx_L4_Source_Match***
- ***uint32_t ETH_L4FilterConfigTypeDef::DestPortFilterMatch***
  Sets the L4 filter destination port match This parameter can be a value of ***ETHEx_L4_Destination_Match***
- ***uint32_t ETH_L4FilterConfigTypeDef::SourcePort***
  Sets the L4 filter source port This parameter must be a value from 0x0 to 0xFFFF
- ***uint32_t ETH_L4FilterConfigTypeDef::DestinationPort***
  Sets the L4 filter destination port This parameter must be a value from 0x0 to 0xFFFF

25.2 ETHEx Firmware driver API description

The following section lists the various functions of the ETHEx library.

25.2.1 Extended features functions

This section provides functions allowing to:

- Configure ARP offload module
- Configure L3 and L4 filters
- Configure Extended VLAN features
- Configure Energy Efficient Ethernet module

This section contains the following APIs:

- *HAL_ETHEx_EnableARPOffload()*
- *HAL_ETHEx_DisableARPOffload()*
- *HAL_ETHEx_SetARPAddressMatch()*
- *HAL_ETHEx_SetL4FilterConfig()*
- *HAL_ETHEx_GetL4FilterConfig()*
- *HAL_ETHEx_SetL3FilterConfig()*
- *HAL_ETHEx_GetL3FilterConfig()*
- *HAL_ETHEx_EnableL3L4Filtering()*
- *HAL_ETHEx_DisableL3L4Filtering()*
- *HAL_ETHEx_GetRxVLANConfig()*
- *HAL_ETHEx_SetRxVLANConfig()*
- *HAL_ETHEx_SetVLANHashTable()*
- *HAL_ETHEx_GetTxVLANConfig()*
- *HAL_ETHEx_SetTxVLANConfig()*
- *HAL_ETHEx_SetTxVLANIdentifier()*
- *HAL_ETHEx_EnableVLANProcessing()*
- *HAL_ETHEx_DisableVLANProcessing()*
- *HAL_ETHEx_EnterLPIMode()*
- *HAL_ETHEx_ExitLPIMode()*
- *HAL_ETHEx_GetMACLPIEvent()*

25.2.2 Detailed description of functions

HAL_ETHEx_EnableARPOffload

Function name

void HAL_ETHEx_EnableARPOffload (ETH_HandleTypeDef * heth)

Function description

Enables ARP Offload.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETHEx_DisableARPOffload

Function name

void HAL_ETHEx_DisableARPOffload (ETH_HandleTypeDef * heth)

Function description

Disables ARP Offload.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETHEx_SetARPAddressMatch

Function name

void HAL_ETHEx_SetARPAddressMatch (ETH_HandleTypeDef * heth, uint32_t lpAddress)

Function description

Set the ARP Match IP address.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **lpAddress:** IP Address to be matched for incoming ARP requests

Return values

- **None:**

HAL_ETHEx_EnableL3L4Filtering

Function name

void HAL_ETHEx_EnableL3L4Filtering (ETH_HandleTypeDef * heth)

Function description

Enables L3 and L4 filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_DisableL3L4Filtering

Function name

void HAL_ETHEx_DisableL3L4Filtering (ETH_HandleTypeDef * heth)

Function description

Disables L3 and L4 filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_GetL3FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetL3FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L3FilterConfigTypeDef * pL3FilterConfig)

Function description

Configures the L3 Filter, this function allow to: set the layer 3 protocol to be matched (IPv4 or IPv6) enable/ disable L3 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L3 filter to configured, this parameter must be one of the following ETH_L3_FILTER_0 ETH_L3_FILTER_1
- **pL3FilterConfig:** pointer to a ETH_L3FilterConfigTypeDef structure that will contain the L3 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_GetL4FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetL4FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L4FilterConfigTypeDef * pL4FilterConfig)

Function description

Configures the L4 Filter, this function allow to: set the layer 4 protocol to be matched (TCP or UDP) enable/ disable L4 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L4 filter to configured, this parameter must be one of the following ETH_L4_FILTER_0 ETH_L4_FILTER_1
- **pL4FilterConfig:** pointer to a ETH_L4FilterConfigTypeDef structure that contains L4 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetL3FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetL3FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L3FilterConfigTypeDef * pL3FilterConfig)

Function description

Configures the L3 Filter, this function allow to: set the layer 3 protocol to be matched (IPv4 or IPv6) enable/ disable L3 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L3 filter to configured, this parameter must be one of the following ETH_L3_FILTER_0 ETH_L3_FILTER_1
- **pL3FilterConfig:** pointer to a ETH_L3FilterConfigTypeDef structure that contains L3 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetL4FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetL4FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L4FilterConfigTypeDef * pL4FilterConfig)

Function description

Configures the L4 Filter, this function allow to: set the layer 4 protocol to be matched (TCP or UDP) enable/ disable L4 source/destination port perfect/inverse match.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **Filter:** L4 filter to configured, this parameter must be one of the following ETH_L4_FILTER_0 ETH_L4_FILTER_1
- **pL4FilterConfig:** pointer to a ETH_L4FilterConfigTypeDef structure that contains L4 filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_EnableVLANProcessing

Function name

void HAL_ETHEx_EnableVLANProcessing (ETH_HandleTypeDef * heth)

Function description

Enables the VLAN Tag Filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_DisableVLANProcessing

Function name

void HAL_ETHEx_DisableVLANProcessing (ETH_HandleTypeDef * heth)

Function description

Disables the VLAN Tag Filtering process.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None.:**

HAL_ETHEx_GetRxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetRxVLANConfig (ETH_HandleTypeDef * heth, ETH_RxVLANConfigTypeDef * pVlanConfig)

Function description

Get the VLAN Configuration for Receive Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pVlanConfig:** pointer to a ETH_RxVLANConfigTypeDef structure that will contain the VLAN filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetRxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetRxVLANConfig (ETH_HandleTypeDef * heth, ETH_RxVLANConfigTypeDef * pVlanConfig)

Function description

Set the VLAN Configuration for Receive Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **pVlanConfig:** pointer to a ETH_RxVLANConfigTypeDef structure that contains VLAN filter configuration.

Return values

- **HAL:** status

HAL_ETHEx_SetVLANHashTable

Function name

void HAL_ETHEx_SetVLANHashTable (ETH_HandleTypeDef * heth, uint32_t VLANHashTable)

Function description

Set the VLAN Hash Table.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANHashTable:** VLAN hash table 16 bit value

Return values

- **None:**

HAL_ETHEx_GetTxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetTxVLANConfig (ETH_HandleTypeDef * heth, uint32_t VLANTag, ETH_TxVLANConfigTypeDef * pVlanConfig)

Function description

Get the VLAN Configuration for Transmit Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANTag:** Selects the vlan tag, this parameter must be one of the following ETH_OUTER_TX_VLANTAG ETH_INNER_TX_VLANTAG
- **pVlanConfig:** pointer to a ETH_TxVLANConfigTypeDef structure that will contain the Tx VLAN filter configuration.

Return values

- **HAL:** Status.

HAL_ETHEx_SetTxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetTxVLANConfig (ETH_HandleTypeDef * heth, uint32_t VLANTag, ETH_TxVLANConfigTypeDef * pVlanConfig)

Function description

Set the VLAN Configuration for Transmit Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANTag:** Selects the vlan tag, this parameter must be one of the following ETH_OUTER_TX_VLANTAG ETH_INNER_TX_VLANTAG
- **pVlanConfig:** pointer to a ETH_TxVLANConfigTypeDef structure that contains Tx VLAN filter configuration.

Return values

- **HAL:** Status

HAL_ETHEx_SetTxVLANIdentifier

Function name

void HAL_ETHEx_SetTxVLANIdentifier (ETH_HandleTypeDef * heth, uint32_t VLANTag, uint32_t VLANIdentifier)

Function description

Set the VLAN Tag Identifier for Transmit Packets.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **VLANTag:** Selects the vlan tag, this parameter must be one of the following ETH_OUTER_TX_VLANTAG ETH_INNER_TX_VLANTAG
- **VLANIdentifier:** VLAN Identifier 16 bit value

Return values

- **None:**

HAL_ETHEx_EnterLPIMode

Function name

void HAL_ETHEx_EnterLPIMode (ETH_HandleTypeDef * heth, FunctionalState TxAutomate, FunctionalState TxClockStop)

Function description

Enters the Low Power Idle (LPI) mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module
- **TxAutomate:** Enable/Disable automate enter/exit LPI mode.
- **TxClockStop:** Enable/Disable Tx clock stop in LPI mode.

Return values

- **None:**

HAL_ETHEx_ExitLPIMode

Function name

void HAL_ETHEx_ExitLPIMode (ETH_HandleTypeDef * heth)

Function description

Exits the Low Power Idle (LPI) mode.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **None:**

HAL_ETHEx_GetMACLPIEvent

Function name

uint32_t HAL_ETHEx_GetMACLPIEvent (const ETH_HandleTypeDef * heth)

Function description

Returns the ETH MAC LPI event.

Parameters

- **heth:** pointer to a ETH_HandleTypeDef structure that contains the configuration information for ETHERNET module

Return values

- **ETH:** MAC WakeUp event

26 HAL EXTI Generic Driver

26.1 EXTI Firmware driver registers structures

26.1.1 EXTI_HandleTypeDef

EXTI_HandleTypeDef is defined in the stm32h5xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***void(* RisingCallback***
- ***void(* FallingCallback***

Field Documentation

- ***uint32_t EXTI_HandleTypeDef::Line***
  Exti line number
- ***void(* EXTI_HandleTypeDef::RisingCallback)(void)***
  Exti rising callback
- ***void(* EXTI_HandleTypeDef::FallingCallback)(void)***
  Exti falling callback

26.1.2 EXTI_ConfigTypeDef

EXTI_ConfigTypeDef is defined in the stm32h5xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***uint32_t Mode***
- ***uint32_t Trigger***
- ***uint32_t GPIOSel***

Field Documentation

- ***uint32_t EXTI_ConfigTypeDef::Line***
  The Exti line to be configured. This parameter can be a value of ***EXTI_Line***
- ***uint32_t EXTI_ConfigTypeDef::Mode***
  The Exit Mode to be configured for a core. This parameter can be a combination of ***EXTI_Mode***
- ***uint32_t EXTI_ConfigTypeDef::Trigger***
  The Exti Trigger to be configured. This parameter can be a value of ***EXTI_Trigger***
- ***uint32_t EXTI_ConfigTypeDef::GPIOSel***
  The Exti GPIO multiplexer selection to be configured. This parameter is only possible for line 0 to 15. It can be a value of ***EXTI_GPIOSel***

26.2 EXTI Firmware driver API description

The following section lists the various functions of the EXTI library.

26.2.1 EXTI Peripheral features

- Each Exti line can be configured within this driver.
- Exti line can be configured in 3 different modes
  - Interrupt
  - Event
  - Both of them
- Configurable Exti lines can be configured with 3 different triggers
  - Rising
  - Falling
  - Both of them

- When set in interrupt mode, configurable Exti lines have two diffenrents interrupt pending registers which allow to distinguish which transition occurs:
  - Rising edge pending interrupt
  - Falling
- Exti lines 0 to 15 are linked to gpio pin number 0 to 15. Gpio port can be selected through multiplexer.

26.2.2 How to use this driver

1. Configure the EXTI line using HAL_EXTI_SetConfigLine().
   - Choose the interrupt line number by setting "Line" member from EXTI_ConfigTypeDef structure.
   - Configure the interrupt and/or event mode using "Mode" member from EXTI_ConfigTypeDef structure.
   - For configurable lines, configure rising and/or falling trigger "Trigger" member from EXTI_ConfigTypeDef structure.
   - For Exti lines linked to gpio, choose gpio port using "GPIOSel" member from GPIO_InitTypeDef structure.
2. Get current Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.
   - Provide pointer on EXTI_ConfigTypeDef structure as second parameter.
3. Clear Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.
4. Register callback to treat Exti interrupts using HAL_EXTI_RegisterCallback().
   - Provide exiting handle as first parameter.
   - Provide which callback will be registered using one value from EXTI_CallbackIDTypeDef.
   - Provide callback function pointer.
5. Get interrupt pending bit using HAL_EXTI_GetPending().
6. Clear interrupt pending bit using HAL_EXTI_GetPending().
7. Generate software interrupt using HAL_EXTI_GenerateSWI().

26.2.3 EXTI attributes functions

This section contains the following APIs:

- ***HAL_EXTI_ConfigLineAttributes()***
- ***HAL_EXTI_GetConfigLineAttributes()***
- ***HAL_EXTI_LockConfigAttributes()***
- ***HAL_EXTI_GetLockConfigAttributes()***

26.2.4 Configuration functions

This section contains the following APIs:

- ***HAL_EXTI_SetConfigLine()***
- ***HAL_EXTI_GetConfigLine()***
- ***HAL_EXTI_ClearConfigLine()***
- ***HAL_EXTI_RegisterCallback()***
- ***HAL_EXTI_GetHandle()***

26.2.5 Detailed description of functions

HAL_EXTI_SetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_SetConfigLine (EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Set configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on EXTI configuration to be set.

Return values

- **HAL:** Status.

HAL_EXTI_GetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLine (EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Get configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on structure to store Exti configuration.

Return values

- **HAL:** Status.

HAL_EXTI_ClearConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_ClearConfigLine (const EXTI_HandleTypeDef * hexti)

Function description

Clear whole configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.

Return values

- **HAL:** Status.

HAL_EXTI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_EXTI_RegisterCallback (EXTI_HandleTypeDef * hexti, EXTI_CallbackIDTypeDef CallbackID, void(*)(void) pPendingCbfn)

Function description

Register callback for a dedicaated Exti line.

Parameters

- **hexti:** Exti handle.
- **CallbackID:** User callback identifier. This parameter can be one of
  - EXTI_CallbackIDTypeDef values.
- **pPendingCbfn:** function pointer to be stored as callback.

Return values

- **HAL:** Status.

HAL_EXTI_GetHandle

Function name

HAL_StatusTypeDef HAL_EXTI_GetHandle (EXTI_HandleTypeDef * hexti, uint32_t ExtiLine)

Function description

Store line number as handle private field.

Parameters

- **hexti:** Exti handle.
- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.

Return values

- **HAL:** Status.

HAL_EXTI_IRQHandler

Function name

void HAL_EXTI_IRQHandler (const EXTI_HandleTypeDef * hexti)

Function description

Handle EXTI interrupt request.

Parameters

- **hexti:** Exti handle.

Return values

- **none.:**

HAL_EXTI_GetPending

Function name

uint32_t HAL_EXTI_GetPending (const EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Get interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be checked. This parameter can be one of the following values:
  - EXTI_TRIGGER_RISING
  - EXTI_TRIGGER_FALLING

Return values

- **1:** if interrupt is pending else 0.

HAL_EXTI_ClearPending

Function name

void HAL_EXTI_ClearPending (const EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Clear interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be clear. This parameter can be one of the following values:
  - EXTI_TRIGGER_RISING
  - EXTI_TRIGGER_FALLING

Return values

- **None.:**

HAL_EXTI_GenerateSWI

Function name

void HAL_EXTI_GenerateSWI (const EXTI_HandleTypeDef * hexti)

Function description

Generate a software interrupt for a dedicated line.

Parameters

- **hexti:** Exti handle.

Return values

- **None.:**

HAL_EXTI_ConfigLineAttributes

Function name

void HAL_EXTI_ConfigLineAttributes (uint32_t ExtiLine, uint32_t LineAttributes)

Function description

Configure the EXTI line attribute(s).

Parameters

- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.
- **LineAttributes:** can be one or a combination of the following values:
  - EXTI_LINE_PRIV Privileged-only access
  - EXTI_LINE_NPRIV Privileged/Non-privileged access
  - EXTI_LINE_SEC Secure-only access
  - EXTI_LINE_NSEC Secure/Non-secure access

Return values

- **None:**

Notes

- Available attributes are to secure EXTI line and set EXT line as privileged. Default state is not secure and unprivileged access allowed.
- Secure and non-secure attributes can only be set from the secure state when the system implements the security (TZEN=1).
- Security and privilege attributes can be set independently.

HAL_EXTI_GetConfigLineAttributes

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLineAttributes (uint32_t ExtiLine, uint32_t * pLineAttributes)

Function description

Get the EXTI line attribute(s).

Parameters

- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.
- **pLineAttributes:** pointer to return line attributes.

Return values

- **HAL:** Status.

Notes

- Secure and non-secure attributes are only available from secure state when the system implements the security (TZEN=1)

HAL_EXTI_LockConfigAttributes

Function name

HAL_StatusTypeDef HAL_EXTI_LockConfigAttributes (void)

Function description

Lock the global EXTI security and privilege configuration.

Return values

- **HAL:** Status.

HAL_EXTI_GetLockConfigAttributes

Function name

HAL_StatusTypeDef HAL_EXTI_GetLockConfigAttributes (uint32_t *const pLockState)

Function description

Get the global EXTI security and privilege lock configuration.

Parameters

- **pLockState:** : Pointer to returned security and privilege configuration

Return values

- **HAL:** Status.

27 HAL FDCAN Generic Driver

27.1 FDCAN Firmware driver registers structures

27.1.1 FDCAN_InitTypeDef

FDCAN_InitTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t ClockDivider***
- ***uint32_t FrameFormat***
- ***uint32_t Mode***
- ***FunctionalState AutoRetransmission***
- ***FunctionalState TransmitPause***
- ***FunctionalState ProtocolException***
- ***uint32_t NominalPrescaler***
- ***uint32_t NominalSyncJumpWidth***
- ***uint32_t NominalTimeSeg1***
- ***uint32_t NominalTimeSeg2***
- ***uint32_t DataPrescaler***
- ***uint32_t DataSyncJumpWidth***
- ***uint32_t DataTimeSeg1***
- ***uint32_t DataTimeSeg2***
- ***uint32_t StdFiltersNbr***
- ***uint32_t ExtFiltersNbr***
- ***uint32_t TxFifoQueueMode***

Field Documentation

- ***uint32_t FDCAN_InitTypeDef::ClockDivider***
  Specifies the FDCAN kernel clock divider. The clock is common to all FDCAN instances. This parameter is applied only at initialisation of first FDCAN instance. This parameter can be a value of ***FDCAN_clock_divider***.
- ***uint32_t FDCAN_InitTypeDef::FrameFormat***
  Specifies the FDCAN frame format. This parameter can be a value of ***FDCAN_frame_format***
- ***uint32_t FDCAN_InitTypeDef::Mode***
  Specifies the FDCAN mode. This parameter can be a value of ***FDCAN_operating_mode***
- ***FunctionalState FDCAN_InitTypeDef::AutoRetransmission***
  Enable or disable the automatic retransmission mode. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::TransmitPause***
  Enable or disable the Transmit Pause feature. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::ProtocolException***
  Enable or disable the Protocol Exception Handling. This parameter can be set to ENABLE or DISABLE
- ***uint32_t FDCAN_InitTypeDef::NominalPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the nominal bit time quanta. This parameter must be a number between 1 and 512
- ***uint32_t FDCAN_InitTypeDef::NominalSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a bit to perform resynchronization. This parameter must be a number between 1 and 128
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg1***
  Specifies the number of time quanta in Bit Segment 1. This parameter must be a number between 2 and 256
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg2***
  Specifies the number of time quanta in Bit Segment 2. This parameter must be a number between 2 and 128

- ***uint32_t FDCAN_InitTypeDef::DataPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the data bit time quanta. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a data bit to perform resynchronization. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg1***
  Specifies the number of time quanta in Data Bit Segment 1. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg2***
  Specifies the number of time quanta in Data Bit Segment 2. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::StdFiltersNbr***
  Specifies the number of standard Message ID filters. This parameter must be a number between 0 and 28
- ***uint32_t FDCAN_InitTypeDef::ExtFiltersNbr***
  Specifies the number of extended Message ID filters. This parameter must be a number between 0 and 8
- ***uint32_t FDCAN_InitTypeDef::TxFifoQueueMode***
  Tx FIFO/Queue Mode selection. This parameter can be a value of ***FDCAN_txFifoQueue_Mode***

27.1.2 FDCAN_FilterTypeDef

FDCAN_FilterTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t IdType***
- ***uint32_t FilterIndex***
- ***uint32_t FilterType***
- ***uint32_t FilterConfig***
- ***uint32_t FilterID1***
- ***uint32_t FilterID2***

Field Documentation

- ***uint32_t FDCAN_FilterTypeDef::IdType***
  Specifies the identifier type. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_FilterTypeDef::FilterIndex***
  Specifies the filter which will be initialized. This parameter must be a number between:
  - 0 and (SRAMCAN_FLS_NBR-1), if IdType is FDCAN_STANDARD_ID
  - 0 and (SRAMCAN_FLE_NBR-1), if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::FilterType***
  Specifies the filter type. This parameter can be a value of ***FDCAN_filter_type***. The value FDCAN_FILTER_RANGE_NO_EIDM is permitted only when IdType is FDCAN_EXTENDED_ID.
- ***uint32_t FDCAN_FilterTypeDef::FilterConfig***
  Specifies the filter configuration. This parameter can be a value of ***FDCAN_filter_config***
- ***uint32_t FDCAN_FilterTypeDef::FilterID1***
  Specifies the filter identification 1. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::FilterID2***
  Specifies the filter identification 2. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID

27.1.3 FDCAN_TxHeaderTypeDef

FDCAN_TxHeaderTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***

- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxEventFifoControl***
- ***uint32_t MessageMarker***

Field Documentation

- ***uint32_t FDCAN_TxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxHeaderTypeDef::IdType***
  Specifies the identifier type for the message that will be transmitted. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxFrameType***
  Specifies the frame type of the message that will be transmitted. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::DataLength***
  Specifies the length of the frame that will be transmitted. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Tx frame will be transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxHeaderTypeDef::FDFormat***
  Specifies whether the Tx frame will be transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxEventFifoControl***
  Specifies the event FIFO control. This parameter can be a value of ***Section 27.3.1 FDCAN_EFC***
- ***uint32_t FDCAN_TxHeaderTypeDef::MessageMarker***
  Specifies the message marker to be copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF

27.1.4 FDCAN_RxHeaderTypeDef

FDCAN_RxHeaderTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t RxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t RxTimestamp***
- ***uint32_t FilterIndex***
- ***uint32_t IsFilterMatchingFrame***

Field Documentation

- ***uint32_t FDCAN_RxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_RxHeaderTypeDef::IdType***
  Specifies the identifier type of the received message. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxFrameType***
  Specifies the the received message frame type. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::DataLength***
  Specifies the received frame length. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_RxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_RxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Rx frame is received with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_RxHeaderTypeDef::FDFormat***
  Specifies whether the Rx frame is received in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxTimestamp***
  Specifies the timestamp counter value captured on start of frame reception. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_RxHeaderTypeDef::FilterIndex***
  Specifies the index of matching Rx acceptance filter element. This parameter must be a number between:
  - 0 and (SRAMCAN_FLS_NBR-1), if IdType is FDCAN_STANDARD_ID
  - 0 and (SRAMCAN_FLE_NBR-1), if IdType is FDCAN_EXTENDED_ID When the frame is a Non-Filter matching frame, this parameter is unused.
- ***uint32_t FDCAN_RxHeaderTypeDef::IsFilterMatchingFrame***
  Specifies whether the accepted frame did not match any Rx filter. Acceptance of non-matching frames may be enabled via **HAL_FDCAN_ConfigGlobalFilter()**. This parameter takes 0 if the frame matched an Rx filter or 1 if it did not match any Rx filter

27.1.5 FDCAN_TxEventFifoTypeDef

FDCAN_TxEventFifoTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxTimestamp***
- ***uint32_t MessageMarker***
- ***uint32_t EventType***

Field Documentation

- ***uint32_t FDCAN_TxEventFifoTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxEventFifoTypeDef::IdType***
  Specifies the identifier type for the transmitted message. This parameter can be a value of ***FDCAN_id_type***

- ***uint32_t FDCAN_TxEventFifoTypeDef::TxFrameType***
  Specifies the frame type of the transmitted message. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxEventFifoTypeDef::DataLength***
  Specifies the length of the transmitted frame. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxEventFifoTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxEventFifoTypeDef::BitRateSwitch***
  Specifies whether the Tx frame is transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxEventFifoTypeDef::FDFormat***
  Specifies whether the Tx frame is transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxEventFifoTypeDef::TxTimestamp***
  Specifies the timestamp counter value captured on start of frame transmission. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::MessageMarker***
  Specifies the message marker copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::EventType***
  Specifies the event type. This parameter can be a value of ***FDCAN_event_type***

27.1.6 FDCAN_HpMsgStatusTypeDef

FDCAN_HpMsgStatusTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t FilterList***
- ***uint32_t FilterIndex***
- ***uint32_t MessageStorage***
- ***uint32_t MessageIndex***

Field Documentation

- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterList***
  Specifies the filter list of the matching filter element. This parameter can be:
  - 0 : Standard Filter List
  - 1 : Extended Filter List
- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterIndex***
  Specifies the index of matching filter element. This parameter can be a number between:
  - 0 and (SRAMCAN_FLS_NBR-1), if FilterList is 0 (Standard)
  - 0 and (SRAMCAN_FLE_NBR-1), if FilterList is 1 (Extended)
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageStorage***
  Specifies the HP Message Storage. This parameter can be a value of ***FDCAN_hp_msg_storage***
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageIndex***
  Specifies the Index of Rx FIFO element to which the message was stored. This parameter is valid only when MessageStorage is: FDCAN_HP_STORAGE_RXFIFO0 or FDCAN_HP_STORAGE_RXFIFO1

27.1.7 FDCAN_ProtocolStatusTypeDef

FDCAN_ProtocolStatusTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t LastErrorCode***
- ***uint32_t DataLastErrorCode***
- ***uint32_t Activity***
- ***uint32_t ErrorPassive***
- ***uint32_t Warning***
- ***uint32_t BusOff***

- ***uint32_t RxESIflag***
- ***uint32_t RxBRSflag***
- ***uint32_t RxFDFflag***
- ***uint32_t ProtocolException***
- ***uint32_t TDCvalue***

Field Documentation

- ***uint32_t FDCAN_ProtocolStatusTypeDef::LastErrorCode***
  Specifies the type of the last error that occurred on the FDCAN bus. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::DataLastErrorCode***
  Specifies the type of the last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Activity***
  Specifies the FDCAN module communication state. This parameter can be a value of ***FDCAN_communication_state***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ErrorPassive***
  Specifies the FDCAN module error status. This parameter can be:
  - 0 : The FDCAN is in Error_Active state
  - 1 : The FDCAN is in Error_Passive state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Warning***
  Specifies the FDCAN module warning status. This parameter can be:
  - 0 : error counters (RxErrorCnt and TxErrorCnt) are below the Error_Warning limit of 96
  - 1 : at least one of error counters has reached the Error_Warning limit of 96
- ***uint32_t FDCAN_ProtocolStatusTypeDef::BusOff***
  Specifies the FDCAN module Bus_Off status. This parameter can be:
  - 0 : The FDCAN is not in Bus_Off state
  - 1 : The FDCAN is in Bus_Off state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxESIflag***
  Specifies ESI flag of last received CAN FD message. This parameter can be:
  - 0 : Last received CAN FD message did not have its ESI flag set
  - 1 : Last received CAN FD message had its ESI flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxBRSflag***
  Specifies BRS flag of last received CAN FD message. This parameter can be:
  - 0 : Last received CAN FD message did not have its BRS flag set
  - 1 : Last received CAN FD message had its BRS flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxFDFflag***
  Specifies if CAN FD message (FDF flag set) has been received since last protocol status. This parameter can be:
  - 0 : No CAN FD message received
  - 1 : CAN FD message received
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ProtocolException***
  Specifies the FDCAN module Protocol Exception status. This parameter can be:
  - 0 : No protocol exception event occurred since last read access
  - 1 : Protocol exception event occurred
- ***uint32_t FDCAN_ProtocolStatusTypeDef::TDCvalue***
  Specifies the Transmitter Delay Compensation Value. This parameter can be a number between 0 and 127

27.1.8 FDCAN_ErrorCountersTypeDef

FDCAN_ErrorCountersTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t TxErrorCnt***
- ***uint32_t RxErrorCnt***
- ***uint32_t RxErrorPassive***

- ***uint32_t ErrorLogging***

Field Documentation

- ***uint32_t FDCAN_ErrorCountersTypeDef::TxErrorCnt***
  Specifies the Transmit Error Counter Value. This parameter can be a number between 0 and 255
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorCnt***
  Specifies the Receive Error Counter Value. This parameter can be a number between 0 and 127
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorPassive***
  Specifies the Receive Error Passive status. This parameter can be:
  – 0 : The Receive Error Counter (RxErrorCnt) is below the error passive level of 128
  – 1 : The Receive Error Counter (RxErrorCnt) has reached the error passive level of 128
- ***uint32_t FDCAN_ErrorCountersTypeDef::ErrorLogging***
  Specifies the Transmit/Receive error logging counter value. This parameter can be a number between 0 and 255. This counter is incremented each time when a FDCAN protocol error causes the TxErrorCnt or the RxErrorCnt to be incremented. The counter stops at 255; the next increment of TxErrorCnt or RxErrorCnt sets interrupt flag FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

27.1.9 FDCAN_MsgRamAddressTypeDef

FDCAN_MsgRamAddressTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***uint32_t StandardFilterSA***
- ***uint32_t ExtendedFilterSA***
- ***uint32_t RxFIFO0SA***
- ***uint32_t RxFIFO1SA***
- ***uint32_t TxEventFIFOSA***
- ***uint32_t TxFIFOQSA***

Field Documentation

- ***uint32_t FDCAN_MsgRamAddressTypeDef::StandardFilterSA***
  Specifies the Standard Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::ExtendedFilterSA***
  Specifies the Extended Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO0SA***
  Specifies the Rx FIFO 0 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO1SA***
  Specifies the Rx FIFO 1 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxEventFIFOSA***
  Specifies the Tx Event FIFO Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxFIFOQSA***
  Specifies the Tx FIFO/Queue Start Address. This parameter must be a 32-bit word address

27.1.10 __FDCAN_HandleTypeDef

__FDCAN_HandleTypeDef is defined in the stm32h5xx_hal_fdcan.h

Data Fields

- ***FDCAN_GlobalTypeDef * Instance***
- ***FDCAN_InitTypeDef Init***
- ***FDCAN_MsgRamAddressTypeDef msgRam***
- ***uint32_t LatestTxFifoQRequest***
- ***__IO HAL_FDCAN_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***void(* TxEventFifoCallback***
- ***void(* RxFifo0Callback***
- ***void(* RxFifo1Callback***

- ***void(* TxFifoEmptyCallback***
- ***void(* TxBufferCompleteCallback***
- ***void(* TxBufferAbortCallback***
- ***void(* HighPriorityMessageCallback***
- ***void(* TimestampWraparoundCallback***
- ***void(* TimeoutOccurredCallback***
- ***void(* ErrorCallback***
- ***void(* ErrorStatusCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***FDCAN_GlobalTypeDef* __FDCAN_HandleTypeDef::Instance***
  Register base address
- ***FDCAN_InitTypeDef __FDCAN_HandleTypeDef::Init***
  FDCAN required parameters
- ***FDCAN_MsgRamAddressTypeDef __FDCAN_HandleTypeDef::msgRam***
  FDCAN Message RAM blocks
- ***uint32_t __FDCAN_HandleTypeDef::LatestTxFifoQRequest***
  FDCAN Tx buffer index of latest Tx FIFO/Queue request
- ***__IO HAL_FDCAN_StateTypeDef __FDCAN_HandleTypeDef::State***
  FDCAN communication state
- ***HAL_LockTypeDef __FDCAN_HandleTypeDef::Lock***
  FDCAN locking object
- ***__IO uint32_t __FDCAN_HandleTypeDef::ErrorCode***
  FDCAN Error code
- ***void(* __FDCAN_HandleTypeDef::TxEventFifoCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TxEventFifoITs)***
  FDCAN Tx Event Fifo callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo0Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo0ITs)***
  FDCAN Rx Fifo 0 callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo1Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo1ITs)***
  FDCAN Rx Fifo 1 callback
- ***void(* __FDCAN_HandleTypeDef::TxFifoEmptyCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Tx Fifo Empty callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferCompleteCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer complete callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferAbortCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer abort callback
- ***void(* __FDCAN_HandleTypeDef::HighPriorityMessageCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN High priority message callback
- ***void(* __FDCAN_HandleTypeDef::TimestampWraparoundCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timestamp wraparound callback
- ***void(* __FDCAN_HandleTypeDef::TimeoutOccurredCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timeout occurred callback
- ***void(* __FDCAN_HandleTypeDef::ErrorCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Error callback

- ***void(* __FDCAN_HandleTypeDef::ErrorStatusCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t ErrorStatusITs)***
  FDCAN Error status callback
- ***void(* __FDCAN_HandleTypeDef::MspInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp Init callback
- ***void(* __FDCAN_HandleTypeDef::MspDeInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp DeInit callback

27.2 FDCAN Firmware driver API description

The following section lists the various functions of the FDCAN library.

27.2.1 How to use this driver

1. Initialize the FDCAN peripheral using HAL_FDCAN_Init function.
2. If needed , configure the reception filters and optional features using the following configuration functions:
   – HAL_FDCAN_ConfigFilter
   – HAL_FDCAN_ConfigGlobalFilter
   – HAL_FDCAN_ConfigExtendedIdMask
   – HAL_FDCAN_ConfigRxFifoOverwrite
   – HAL_FDCAN_ConfigRamWatchdog
   – HAL_FDCAN_ConfigTimestampCounter
   – HAL_FDCAN_EnableTimestampCounter
   – HAL_FDCAN_DisableTimestampCounter
   – HAL_FDCAN_ConfigTimeoutCounter
   – HAL_FDCAN_EnableTimeoutCounter
   – HAL_FDCAN_DisableTimeoutCounter
   – HAL_FDCAN_ConfigTxDelayCompensation
   – HAL_FDCAN_EnableTxDelayCompensation
   – HAL_FDCAN_DisableTxDelayCompensation
   – HAL_FDCAN_EnableISOMode
   – HAL_FDCAN_DisableISOMode
   – HAL_FDCAN_EnableEdgeFiltering
   – HAL_FDCAN_DisableEdgeFiltering
3. Start the FDCAN module using HAL_FDCAN_Start function. At this level the node is active on the bus: it can send and receive messages.
4. The following Tx control functions can only be called when the FDCAN module is started:
   – HAL_FDCAN_AddMessageToTxFifoQ
   – HAL_FDCAN_AbortTxRequest
5. After having submitted a Tx request in Tx Fifo or Queue, it is possible to get Tx buffer location used to place the Tx request thanks to HAL_FDCAN_GetLatestTxFifoQRequestBuffer API. It is then possible to abort later on the corresponding Tx Request using HAL_FDCAN_AbortTxRequest API.
6. When a message is received into the FDCAN message RAM, it can be retrieved using the HAL_FDCAN_GetRxMessage function.
7. Calling the HAL_FDCAN_Stop function stops the FDCAN module by entering it to initialization mode and re-enabling access to configuration registers through the configuration functions listed here above.
8. All other control functions can be called any time after initialization phase, no matter if the FDCAN module is started or stopped.

Polling mode operation

1. Reception and transmission states can be monitored via the following functions:
   – HAL_FDCAN_IsTxBufferMessagePending
   – HAL_FDCAN_GetRxFifoFillLevel
   – HAL_FDCAN_GetTxFifoFreeLevel

Interrupt mode operation

1. There are two interrupt lines: line 0 and 1. By default, all interrupts are assigned to line 0. Interrupt lines can be configured using HAL_FDCAN_ConfigInterruptLines function.
2. Notifications are activated using HAL_FDCAN_ActivateNotification function. Then, the process can be controlled through one of the available user callbacks: HAL_FDCAN_xxxCallback.

Callback registration

27.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the FDCAN.
- De-initialize the FDCAN.
- Enter FDCAN peripheral in power down mode.
- Exit power down mode.
- Register callbacks.
- Unregister callbacks.

This section contains the following APIs:

- ***HAL_FDCAN_Init()***
- ***HAL_FDCAN_DeInit()***
- ***HAL_FDCAN_MspInit()***
- ***HAL_FDCAN_MspDeInit()***
- ***HAL_FDCAN_EnterPowerDownMode()***
- ***HAL_FDCAN_ExitPowerDownMode()***
- ***HAL_FDCAN_RegisterCallback()***
- ***HAL_FDCAN_UnRegisterCallback()***
- ***HAL_FDCAN_RegisterTxEventFifoCallback()***
- ***HAL_FDCAN_UnRegisterTxEventFifoCallback()***
- ***HAL_FDCAN_RegisterRxFifo0Callback()***
- ***HAL_FDCAN_UnRegisterRxFifo0Callback()***
- ***HAL_FDCAN_RegisterRxFifo1Callback()***
- ***HAL_FDCAN_UnRegisterRxFifo1Callback()***
- ***HAL_FDCAN_RegisterTxBufferCompleteCallback()***
- ***HAL_FDCAN_UnRegisterTxBufferCompleteCallback()***
- ***HAL_FDCAN_RegisterTxBufferAbortCallback()***
- ***HAL_FDCAN_UnRegisterTxBufferAbortCallback()***
- ***HAL_FDCAN_RegisterErrorStatusCallback()***
- ***HAL_FDCAN_UnRegisterErrorStatusCallback()***
- ***HAL_FDCAN_RegisterCallback()***

27.2.3 Configuration functions

This section provides functions allowing to:

- HAL_FDCAN_ConfigFilter : Configure the FDCAN reception filters
- HAL_FDCAN_ConfigGlobalFilter : Configure the FDCAN global filter
- HAL_FDCAN_ConfigExtendedIdMask : Configure the extended ID mask
- HAL_FDCAN_ConfigRxFifoOverwrite : Configure the Rx FIFO operation mode
- HAL_FDCAN_ConfigRamWatchdog : Configure the RAM watchdog
- HAL_FDCAN_ConfigTimestampCounter : Configure the timestamp counter
- HAL_FDCAN_EnableTimestampCounter : Enable the timestamp counter
- HAL_FDCAN_DisableTimestampCounter : Disable the timestamp counter

- HAL_FDCAN_GetTimestampCounter : Get the timestamp counter value
- HAL_FDCAN_ResetTimestampCounter : Reset the timestamp counter to zero
- HAL_FDCAN_ConfigTimeoutCounter : Configure the timeout counter
- HAL_FDCAN_EnableTimeoutCounter : Enable the timeout counter
- HAL_FDCAN_DisableTimeoutCounter : Disable the timeout counter
- HAL_FDCAN_GetTimeoutCounter : Get the timeout counter value
- HAL_FDCAN_ResetTimeoutCounter : Reset the timeout counter to its start value
- HAL_FDCAN_ConfigTxDelayCompensation : Configure the transmitter delay compensation
- HAL_FDCAN_EnableTxDelayCompensation : Enable the transmitter delay compensation
- HAL_FDCAN_DisableTxDelayCompensation : Disable the transmitter delay compensation
- HAL_FDCAN_EnableISOMode : Enable ISO 11898-1 protocol mode
- HAL_FDCAN_DisableISOMode : Disable ISO 11898-1 protocol mode
- HAL_FDCAN_EnableEdgeFiltering : Enable edge filtering during bus integration
- HAL_FDCAN_DisableEdgeFiltering : Disable edge filtering during bus integration

This section contains the following APIs:

- ***HAL_FDCAN_ConfigFilter()***
- ***HAL_FDCAN_ConfigGlobalFilter()***
- ***HAL_FDCAN_ConfigExtendedIdMask()***
- ***HAL_FDCAN_ConfigRxFifoOverwrite()***
- ***HAL_FDCAN_ConfigRamWatchdog()***
- ***HAL_FDCAN_ConfigTimestampCounter()***
- ***HAL_FDCAN_EnableTimestampCounter()***
- ***HAL_FDCAN_DisableTimestampCounter()***
- ***HAL_FDCAN_GetTimestampCounter()***
- ***HAL_FDCAN_ResetTimestampCounter()***
- ***HAL_FDCAN_ConfigTimeoutCounter()***
- ***HAL_FDCAN_EnableTimeoutCounter()***
- ***HAL_FDCAN_DisableTimeoutCounter()***
- ***HAL_FDCAN_GetTimeoutCounter()***
- ***HAL_FDCAN_ResetTimeoutCounter()***
- ***HAL_FDCAN_ConfigTxDelayCompensation()***
- ***HAL_FDCAN_EnableTxDelayCompensation()***
- ***HAL_FDCAN_DisableTxDelayCompensation()***
- ***HAL_FDCAN_EnableISOMode()***
- ***HAL_FDCAN_DisableISOMode()***
- ***HAL_FDCAN_EnableEdgeFiltering()***
- ***HAL_FDCAN_DisableEdgeFiltering()***

27.2.4 Control functions

This section provides functions allowing to:

- HAL_FDCAN_Start : Start the FDCAN module
- HAL_FDCAN_Stop : Stop the FDCAN module and enable access to configuration registers
- HAL_FDCAN_AddMessageToTxFifoQ : Add a message to the Tx FIFO/Queue and activate the corresponding transmission request
- HAL_FDCAN_GetLatestTxFifoQRequestBuffer : Get Tx buffer index of latest Tx FIFO/Queue request
- HAL_FDCAN_AbortTxRequest : Abort transmission request
- HAL_FDCAN_GetRxMessage : Get an FDCAN frame from the Rx FIFO zone into the message RAM
- HAL_FDCAN_GetTxEvent : Get an FDCAN Tx event from the Tx Event FIFO zone into the message RAM
- HAL_FDCAN_GetHighPriorityMessageStatus : Get high priority message status
- HAL_FDCAN_GetProtocolStatus : Get protocol status

- HAL_FDCAN_GetErrorCounters : Get error counter values
- HAL_FDCAN_IsTxBufferMessagePending : Check if a transmission request is pending on the selected Tx buffer
- HAL_FDCAN_GetRxFifoFillLevel : Return Rx FIFO fill level
- HAL_FDCAN_GetTxFifoFreeLevel : Return Tx FIFO free level
- HAL_FDCAN_IsRestrictedOperationMode : Check if the FDCAN peripheral entered Restricted Operation Mode
- HAL_FDCAN_ExitRestrictedOperationMode : Exit Restricted Operation Mode

This section contains the following APIs:

- ***HAL_FDCAN_Start()***
- ***HAL_FDCAN_Stop()***
- ***HAL_FDCAN_AddMessageToTxFifoQ()***
- ***HAL_FDCAN_GetLatestTxFifoQRequestBuffer()***
- ***HAL_FDCAN_AbortTxRequest()***
- ***HAL_FDCAN_GetRxMessage()***
- ***HAL_FDCAN_GetTxEvent()***
- ***HAL_FDCAN_GetHighPriorityMessageStatus()***
- ***HAL_FDCAN_GetProtocolStatus()***
- ***HAL_FDCAN_GetErrorCounters()***
- ***HAL_FDCAN_IsTxBufferMessagePending()***
- ***HAL_FDCAN_GetRxFifoFillLevel()***
- ***HAL_FDCAN_GetTxFifoFreeLevel()***
- ***HAL_FDCAN_IsRestrictedOperationMode()***
- ***HAL_FDCAN_ExitRestrictedOperationMode()***

27.2.5 Interrupts management

This section provides functions allowing to:

- HAL_FDCAN_ConfigInterruptLines : Assign interrupts to either Interrupt line 0 or 1
- HAL_FDCAN_ActivateNotification : Enable interrupts
- HAL_FDCAN_DeactivateNotification : Disable interrupts
- HAL_FDCAN_IRQHandler : Handles FDCAN interrupt request

This section contains the following APIs:

- ***HAL_FDCAN_ConfigInterruptLines()***
- ***HAL_FDCAN_ActivateNotification()***
- ***HAL_FDCAN_DeactivateNotification()***
- ***HAL_FDCAN_IRQHandler()***

27.2.6 Callback functions

This subsection provides the following callback functions:

- HAL_FDCAN_TxEventFifoCallback
- HAL_FDCAN_RxFifo0Callback
- HAL_FDCAN_RxFifo1Callback
- HAL_FDCAN_TxFifoEmptyCallback
- HAL_FDCAN_TxBufferCompleteCallback
- HAL_FDCAN_TxBufferAbortCallback
- HAL_FDCAN_HighPriorityMessageCallback
- HAL_FDCAN_TimestampWraparoundCallback
- HAL_FDCAN_TimeoutOccurredCallback
- HAL_FDCAN_ErrorCallback
- HAL_FDCAN_ErrorStatusCallback

This section contains the following APIs:

- *HAL_FDCAN_TxEventFifoCallback()*
- *HAL_FDCAN_RxFifo0Callback()*
- *HAL_FDCAN_RxFifo1Callback()*
- *HAL_FDCAN_TxFifoEmptyCallback()*
- *HAL_FDCAN_TxBufferCompleteCallback()*
- *HAL_FDCAN_TxBufferAbortCallback()*
- *HAL_FDCAN_TimestampWraparoundCallback()*
- *HAL_FDCAN_TimeoutOccurredCallback()*
- *HAL_FDCAN_HighPriorityMessageCallback()*
- *HAL_FDCAN_ErrorCallback()*
- *HAL_FDCAN_ErrorStatusCallback()*

27.2.7 Peripheral State functions

This subsection provides functions allowing to :

- HAL_FDCAN_GetState() : Return the FDCAN state.
- HAL_FDCAN_GetError() : Return the FDCAN error code if any.

This section contains the following APIs:

- *HAL_FDCAN_GetState()*
- *HAL_FDCAN_GetError()*

27.2.8 Detailed description of functions

HAL_FDCAN_Init

Function name

HAL_StatusTypeDef HAL_FDCAN_Init (FDCAN_HandleTypeDef * hfdcan)

Function description

Initializes the FDCAN peripheral according to the specified parameters in the FDCAN_InitTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DeInit

Function name

HAL_StatusTypeDef HAL_FDCAN_DeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

Deinitializes the FDCAN peripheral registers to their default reset values.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_MspInit

Function name

void HAL_FDCAN_MspInit (FDCAN_HandleTypeDef * hfdcan)

Function description

Initializes the FDCAN MSP.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_MspDeInit

Function name

void HAL_FDCAN_MspDeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

DeInitializes the FDCAN MSP.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_EnterPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnterPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Enter FDCAN peripheral in sleep mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ExitPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Exit power down mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID, pFDCAN_CallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID)

Function description

Unregister a FDCAN CallBack.

Parameters

- **hfdcan:** pointer to a FDCAN_HandleTypeDef structure that contains the configuration information for FDCAN module
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_FDCAN_TX_FIFO_EMPTY_CB_ID Tx Fifo Empty callback ID
  - HAL_FDCAN_HIGH_PRIO_MESSAGE_CB_ID High priority message callback ID
  - HAL_FDCAN_TIMESTAMP_WRAPAROUND_CB_ID Timestamp wraparound callback ID
  - HAL_FDCAN_TIMEOUT_OCCURRED_CB_ID Timeout occurred callback ID
  - HAL_FDCAN_ERROR_CALLBACK_CB_ID Error callback ID
  - HAL_FDCAN_MSPINIT_CB_ID MspInit callback ID
  - HAL_FDCAN_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxEventFifoCallbackTypeDef pCallback)

Function description

Register Tx Event Fifo FDCAN Callback To be used instead of the weak HAL_FDCAN_TxEventFifoCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Event Fifo Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Event Fifo FDCAN Callback Tx Event Fifo FDCAN Callback is redirected to the weak HAL_FDCAN_TxEventFifoCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo0CallbackTypeDef pCallback)

Function description

Register Rx Fifo 0 FDCAN Callback To be used instead of the weak HAL_FDCAN_RxFifo0Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Rx Fifo 0 Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Rx Fifo 0 FDCAN Callback Rx Fifo 0 FDCAN Callback is redirected to the weak HAL_FDCAN_RxFifo0Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo1CallbackTypeDef pCallback)

Function description

Register Rx Fifo 1 FDCAN Callback To be used instead of the weak HAL_FDCAN_RxFifo1Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Rx Fifo 1 Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Rx Fifo 1 FDCAN Callback Rx Fifo 1 FDCAN Callback is redirected to the weak HAL_FDCAN_RxFifo1Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferCompleteCallbackTypeDef pCallback)

Function description

Register Tx Buffer Complete FDCAN Callback To be used instead of the weak HAL_FDCAN_TxBufferCompleteCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Buffer Complete Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Buffer Complete FDCAN Callback Tx Buffer Complete FDCAN Callback is redirected to the weak HAL_FDCAN_TxBufferCompleteCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferAbortCallbackTypeDef pCallback)

Function description

Register Tx Buffer Abort FDCAN Callback To be used instead of the weak HAL_FDCAN_TxBufferAbortCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Buffer Abort Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Buffer Abort FDCAN Callback Tx Buffer Abort FDCAN Callback is redirected to the weak HAL_FDCAN_TxBufferAbortCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_ErrorStatusCallbackTypeDef pCallback)

Function description

Register Error Status FDCAN Callback To be used instead of the weak HAL_FDCAN_ErrorStatusCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Error Status Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Error Status FDCAN Callback Error Status FDCAN Callback is redirected to the weak HAL_FDCAN_ErrorStatusCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_ConfigFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigFilter (FDCAN_HandleTypeDef * hfdcan, const FDCAN_FilterTypeDef * sFilterConfig)

Function description

Configure the FDCAN reception filter according to the specified parameters in the FDCAN_FilterTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **sFilterConfig:** pointer to an FDCAN_FilterTypeDef structure that contains the filter configuration information

Return values

- **HAL:** status

HAL_FDCAN_ConfigGlobalFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigGlobalFilter (FDCAN_HandleTypeDef * hfdcan, uint32_t NonMatchingStd, uint32_t NonMatchingExt, uint32_t RejectRemoteStd, uint32_t RejectRemoteExt)

Function description

Configure the FDCAN global filter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **NonMatchingStd:** Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. This parameter can be a value of
  - FDCAN_Non_Matching_Frames.
- **NonMatchingExt:** Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. This parameter can be a value of
  - FDCAN_Non_Matching_Frames.
- **RejectRemoteStd:** Filter or reject all the remote 11-bit IDs frames. This parameter can be a value of
  - FDCAN_Reject_Remote_Frames.
- **RejectRemoteExt:** Filter or reject all the remote 29-bit IDs frames. This parameter can be a value of
  - FDCAN_Reject_Remote_Frames.

Return values

- **HAL:** status

HAL_FDCAN_ConfigExtendedIdMask

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigExtendedIdMask (FDCAN_HandleTypeDef * hfdcan, uint32_t Mask)

Function description

Configure the extended ID mask.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **Mask:** Extended ID Mask. This parameter must be a number between 0 and 0x1FFFFFFF.

Return values

- **HAL:** status

HAL_FDCAN_ConfigRxFifoOverwrite

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRxFifoOverwrite (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo, uint32_t OperationMode)

Function description

Configure the Rx FIFO operation mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo:** Rx FIFO. This parameter can be one of the following values:
  - FDCAN_RX_FIFO0: Rx FIFO 0
  - FDCAN_RX_FIFO1: Rx FIFO 1
- **OperationMode:** operation mode. This parameter can be a value of
  - FDCAN_Rx_FIFO_operation_mode.

Return values

- **HAL:** status

HAL_FDCAN_ConfigRamWatchdog

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRamWatchdog (FDCAN_HandleTypeDef * hfdcan, uint32_t CounterStartValue)

Function description

Configure the RAM watchdog.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **CounterStartValue:** Start value of the Message RAM Watchdog Counter, This parameter must be a number between 0x00 and 0xFF, with the reset value of 0x00 the counter is disabled.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampPrescaler)

Function description

Configure the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimestampPrescaler:** Timestamp Counter Prescaler. This parameter can be a value of
  - FDCAN_Timestamp_Prescaler.

Return values

- **HAL:** status

HAL_FDCAN_EnableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampOperation)

Function description

Enable the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimestampOperation:** Timestamp counter operation. This parameter can be a value of
  - FDCAN_Timestamp.

Return values

- **HAL:** status

HAL_FDCAN_DisableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetTimestampCounter

Function name

uint16_t HAL_FDCAN_GetTimestampCounter (const FDCAN_HandleTypeDef * hfdcan)

Function description

Get the timestamp counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Timestamp:** counter value

HAL_FDCAN_ResetTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the timestamp counter to zero.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimeoutCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimeoutOperation, uint32_t TimeoutPeriod)

Function description

Configure the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimeoutOperation:** Timeout counter operation. This parameter can be a value of
  - FDCAN_Timeout_Operation.
- **TimeoutPeriod:** Start value of the timeout down-counter. This parameter must be a number between 0x0000 and 0xFFFF

Return values

- **HAL:** status

HAL_FDCAN_EnableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetTimeoutCounter

Function name

uint16_t HAL_FDCAN_GetTimeoutCounter (const FDCAN_HandleTypeDef * hfdcan)

Function description

Get the timeout counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Timeout:** counter value

HAL_FDCAN_ResetTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the timeout counter to its start value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan, uint32_t TdcOffset, uint32_t TdcFilter)

Function description

Configure the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TdcOffset:** Transmitter Delay Compensation Offset. This parameter must be a number between 0x00 and 0x7F.
- **TdcFilter:** Transmitter Delay Compensation Filter Window Length. This parameter must be a number between 0x00 and 0x7F.

Return values

- **HAL:** status

HAL_FDCAN_EnableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_EnableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable ISO 11898-1 protocol mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable ISO 11898-1 protocol mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_EnableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable edge filtering during bus integration.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable edge filtering during bus integration.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_Start

Function name

HAL_StatusTypeDef HAL_FDCAN_Start (FDCAN_HandleTypeDef * hfdcan)

Function description

Start the FDCAN module.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_Stop

Function name

HAL_StatusTypeDef HAL_FDCAN_Stop (FDCAN_HandleTypeDef * hfdcan)

Function description

Stop the FDCAN module and enable access to configuration registers.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_AddMessageToTxFifoQ

Function name

HAL_StatusTypeDef HAL_FDCAN_AddMessageToTxFifoQ (FDCAN_HandleTypeDef * hfdcan, const FDCAN_TxHeaderTypeDef * pTxHeader, const uint8_t * pTxData)

Function description

Add a message to the Tx FIFO/Queue and activate the corresponding transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxHeader:** pointer to a FDCAN_TxHeaderTypeDef structure.
- **pTxData:** pointer to a buffer containing the payload of the Tx frame.

Return values

- **HAL:** status

HAL_FDCAN_GetLatestTxFifoQRequestBuffer

Function name

uint32_t HAL_FDCAN_GetLatestTxFifoQRequestBuffer (const FDCAN_HandleTypeDef * hfdcan)

Function description

Get Tx buffer index of latest Tx FIFO/Queue request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Tx:** buffer index of last Tx FIFO/Queue request
  - Any value of
    - FDCAN_Tx_location if Tx request has been submitted.
  - 0 if no Tx FIFO/Queue request have been submitted.

HAL_FDCAN_AbortTxRequest

Function name

HAL_StatusTypeDef HAL_FDCAN_AbortTxRequest (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndex)

Function description

Abort transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndex:** buffer index. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **HAL:** status

HAL_FDCAN_GetRxMessage

Function name

HAL_StatusTypeDef HAL_FDCAN_GetRxMessage (FDCAN_HandleTypeDef * hfdcan, uint32_t RxLocation, FDCAN_RxHeaderTypeDef * pRxHeader, uint8_t * pRxData)

Function description

Get an FDCAN frame from the Rx FIFO zone into the message RAM.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxLocation:** Location of the received message to be read. This parameter can be a value of
  - FDCAN_Rx_location.
- **pRxHeader:** pointer to a FDCAN_RxHeaderTypeDef structure.
- **pRxData:** pointer to a buffer where the payload of the Rx frame will be stored.

Return values

- **HAL:** status

HAL_FDCAN_GetTxEvent

Function name

HAL_StatusTypeDef HAL_FDCAN_GetTxEvent (FDCAN_HandleTypeDef * hfdcan, FDCAN_TxEventFifoTypeDef * pTxEvent)

Function description

Get an FDCAN Tx event from the Tx Event FIFO zone into the message RAM.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxEvent:** pointer to a FDCAN_TxEventFifoTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetHighPriorityMessageStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetHighPriorityMessageStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_HpMsgStatusTypeDef * HpMsgStatus)

Function description

Get high priority message status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **HpMsgStatus:** pointer to an FDCAN_HpMsgStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetProtocolStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetProtocolStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_ProtocolStatusTypeDef * ProtocolStatus)

Function description

Get protocol status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ProtocolStatus:** pointer to an FDCAN_ProtocolStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetErrorCounters

Function name

HAL_StatusTypeDef HAL_FDCAN_GetErrorCounters (const FDCAN_HandleTypeDef * hfdcan, FDCAN_ErrorCountersTypeDef * ErrorCounters)

Function description

Get error counter values.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ErrorCounters:** pointer to an FDCAN_ErrorCountersTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_IsTxBufferMessagePending

Function name

uint32_t HAL_FDCAN_IsTxBufferMessagePending (const FDCAN_HandleTypeDef * hfdcan, uint32_t TxBufferIndex)

Function description

Check if a transmission request is pending on the selected Tx buffer.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TxBufferIndex:** Tx buffer index. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **Status:**
  - 0 : No pending transmission request on TxBufferIndex list.
  - 1 : Pending transmission request on TxBufferIndex.

HAL_FDCAN_GetRxFifoFillLevel

Function name

uint32_t HAL_FDCAN_GetRxFifoFillLevel (const FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo)

Function description

Return Rx FIFO fill level.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo:** Rx FIFO. This parameter can be one of the following values:
  - FDCAN_RX_FIFO0: Rx FIFO 0
  - FDCAN_RX_FIFO1: Rx FIFO 1

Return values

- **Rx:** FIFO fill level.

HAL_FDCAN_GetTxFifoFreeLevel

Function name

uint32_t HAL_FDCAN_GetTxFifoFreeLevel (const FDCAN_HandleTypeDef * hfdcan)

Function description

Return Tx FIFO free level: number of consecutive free Tx FIFO elements starting from Tx FIFO GetIndex.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Tx:** FIFO free level.

HAL_FDCAN_IsRestrictedOperationMode

Function name

uint32_t HAL_FDCAN_IsRestrictedOperationMode (const FDCAN_HandleTypeDef * hfdcan)

Function description

Check if the FDCAN peripheral entered Restricted Operation Mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Status:**
  - 0 : Normal FDCAN operation.
  - 1 : Restricted Operation Mode active.

HAL_FDCAN_ExitRestrictedOperationMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitRestrictedOperationMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Exit Restricted Operation Mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigInterruptLines

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigInterruptLines (FDCAN_HandleTypeDef * hfdcan, uint32_t ITList, uint32_t InterruptLine)

Function description

Assign interrupts to either Interrupt line 0 or 1.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ITList:** indicates which interrupts group will be assigned to the selected interrupt line. This parameter can be any combination of
  - FDCAN_Interrupts_Group.
- **InterruptLine:** Interrupt line. This parameter can be a value of
  - FDCAN_Interrupt_Line.

Return values

- **HAL:** status

HAL_FDCAN_ActivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_ActivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t ActiveITs, uint32_t BufferIndexes)

Function description

Enable interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ActiveITs:** indicates which interrupts will be enabled. This parameter can be any combination of
  - FDCAN_Interrupts.
- **BufferIndexes:** Tx Buffer Indexes. This parameter can be any combination of
  - FDCAN_Tx_location. This parameter is ignored if ActiveITs does not include one of the following:
    - FDCAN_IT_TX_COMPLETE
    - FDCAN_IT_TX_ABORT_COMPLETE

Return values

- **HAL:** status

HAL_FDCAN_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_DeactivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t InactiveITs)

Function description

Disable interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **InactiveITs:** indicates which interrupts will be disabled. This parameter can be any combination of
  - FDCAN_Interrupts.

Return values

- **HAL:** status

HAL_FDCAN_IRQHandler

Function name

void HAL_FDCAN_IRQHandler (FDCAN_HandleTypeDef * hfdcan)

Function description

Handles FDCAN interrupt request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TxEventFifoCallback

Function name

void HAL_FDCAN_TxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TxEventFifoITs)

Function description

Tx Event callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TxEventFifoITs:** indicates which Tx Event FIFO interrupts are signaled. This parameter can be any combination of
  - FDCAN_Tx_Event_Fifo_Interrupts.

Return values

- **None:**

HAL_FDCAN_RxFifo0Callback

Function name

void HAL_FDCAN_RxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo0ITs)

Function description

Rx FIFO 0 callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo0ITs:** indicates which Rx FIFO 0 interrupts are signaled. This parameter can be any combination of
  - FDCAN_Rx_Fifo0_Interrupts.

Return values

- **None:**

HAL_FDCAN_RxFifo1Callback

Function name

void HAL_FDCAN_RxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo1ITs)

Function description

Rx FIFO 1 callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo1ITs:** indicates which Rx FIFO 1 interrupts are signaled. This parameter can be any combination of
  - FDCAN_Rx_Fifo1_Interrupts.

Return values

- **None:**

HAL_FDCAN_TxFifoEmptyCallback

Function name

void HAL_FDCAN_TxFifoEmptyCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Tx FIFO Empty callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TxBufferCompleteCallback

Function name

void HAL_FDCAN_TxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

Transmission Complete callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndexes:** Indexes of the transmitted buffers. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **None:**

HAL_FDCAN_TxBufferAbortCallback

Function name

void HAL_FDCAN_TxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

Transmission Cancellation callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndexes:** Indexes of the aborted buffers. This parameter can be any combination of
  – FDCAN_Tx_location.

Return values

- **None:**

HAL_FDCAN_HighPriorityMessageCallback

Function name

void HAL_FDCAN_HighPriorityMessageCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

High Priority Message callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TimestampWraparoundCallback

Function name

void HAL_FDCAN_TimestampWraparoundCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Timestamp Wraparound callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TimeoutOccurredCallback

Function name

void HAL_FDCAN_TimeoutOccurredCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Timeout Occurred callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_ErrorCallback

Function name

void HAL_FDCAN_ErrorCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Error callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_ErrorStatusCallback

Function name

void HAL_FDCAN_ErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t ErrorStatusITs)

Function description

Error status callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ErrorStatusITs:** indicates which Error Status interrupts are signaled. This parameter can be any combination of
  - FDCAN_Error_Status_Interrupts.

Return values

- **None:**

HAL_FDCAN_GetError

Function name

uint32_t HAL_FDCAN_GetError (const FDCAN_HandleTypeDef * hfdcan)

Function description

Return the FDCAN error code.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **FDCAN:** Error Code

HAL_FDCAN_GetState

Function name

HAL_FDCAN_StateTypeDef HAL_FDCAN_GetState (const FDCAN_HandleTypeDef * hfdcan)

Function description

Return the FDCAN state.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** state

27.3 FDCAN Firmware driver defines

The following section lists the various define and macros of the module.

27.3.1 FDCAN

FDCAN

FDCAN Bit Rate Switching

FDCAN_BRS_OFF

FDCAN frames transmitted/received without bit rate switching

FDCAN_BRS_ON

FDCAN frames transmitted/received with bit rate switching

FDCAN Clock Divider

FDCAN_CLOCK_DIV1

Divide kernel clock by 1

FDCAN_CLOCK_DIV2

Divide kernel clock by 2

FDCAN_CLOCK_DIV4

Divide kernel clock by 4

FDCAN_CLOCK_DIV6

Divide kernel clock by 6

FDCAN_CLOCK_DIV8

Divide kernel clock by 8

FDCAN_CLOCK_DIV10

Divide kernel clock by 10

FDCAN_CLOCK_DIV12

Divide kernel clock by 12

FDCAN_CLOCK_DIV14

Divide kernel clock by 14

FDCAN_CLOCK_DIV16

Divide kernel clock by 16

FDCAN_CLOCK_DIV18

Divide kernel clock by 18

FDCAN_CLOCK_DIV20

Divide kernel clock by 20

FDCAN_CLOCK_DIV22

Divide kernel clock by 22

FDCAN_CLOCK_DIV24

Divide kernel clock by 24

FDCAN_CLOCK_DIV26

Divide kernel clock by 26

FDCAN_CLOCK_DIV28

Divide kernel clock by 28

FDCAN_CLOCK_DIV30

Divide kernel clock by 30

FDCAN communication state

FDCAN_COM_STATE_SYNC

Node is synchronizing on CAN communication

FDCAN_COM_STATE_IDLE

Node is neither receiver nor transmitter

FDCAN_COM_STATE_RX

Node is operating as receiver

FDCAN_COM_STATE_TX

Node is operating as transmitter

FDCAN Counter Interrupts

FDCAN_IT_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_IT_TIMEOUT_OCCURRED

Timeout reached

FDCAN Data Length Code

FDCAN_DLC_BYTES_0

0 bytes data field

FDCAN_DLC_BYTES_1

1 bytes data field

FDCAN_DLC_BYTES_2

2 bytes data field

FDCAN_DLC_BYTES_3

3 bytes data field

FDCAN_DLC_BYTES_4

4 bytes data field

FDCAN_DLC_BYTES_5

5 bytes data field

FDCAN_DLC_BYTES_6

6 bytes data field

FDCAN_DLC_BYTES_7

7 bytes data field

FDCAN_DLC_BYTES_8

8 bytes data field

FDCAN_DLC_BYTES_12

12 bytes data field

FDCAN_DLC_BYTES_16

16 bytes data field

FDCAN_DLC_BYTES_20

20 bytes data field

FDCAN_DLC_BYTES_24

24 bytes data field

FDCAN_DLC_BYTES_32

32 bytes data field

FDCAN_DLC_BYTES_48

48 bytes data field

FDCAN_DLC_BYTES_64

64 bytes data field

FDCAN Error Interrupts

FDCAN_IT_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_IT_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_IT_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_IT_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_IT_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_IT_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN Error State Indicator

FDCAN_ESI_ACTIVE

Transmitting node is error active

FDCAN_ESI_PASSIVE

Transmitting node is error passive

FDCAN Error Status Interrupts

FDCAN_IT_ERROR_PASSIVE

Error_Passive status changed

FDCAN_IT_ERROR_WARNING

Error_Warning status changed

FDCAN_IT_BUS_OFF

Bus_Off status changed

FDCAN Event Type

FDCAN_TX_EVENT

Tx event

FDCAN_TX_IN_SPITE_OF_ABORT

Transmission in spite of cancellation

FDCAN Exported Macros

__HAL_FDCAN_RESET_HANDLE_STATE

Description:

- Reset FDCAN handle state.

Parameters:

- __HANDLE__: FDCAN handle.

Return value:

- None

__HAL_FDCAN_ENABLE_IT

Description:

- Enable the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_DISABLE_IT

Description:

- Disable the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_GET_IT

Description:

- Check whether the specified FDCAN interrupt is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be one of
  - FDCAN_Interrupts

Return value:

- ITStatus

__HAL_FDCAN_CLEAR_IT

Description:

- Clear the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the interrupts to clear. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_GET_FLAG

Description:

- Check whether the specified FDCAN flag is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: FDCAN flag. This parameter can be one of
  - FDCAN_flags

Return value:

- FlagStatus

__HAL_FDCAN_CLEAR_FLAG

Description:

- Clear the specified FDCAN flags.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: specifies the flags to clear. This parameter can be any combination of
  - FDCAN_flags

Return value:

- None

__HAL_FDCAN_GET_IT_SOURCE

Description:

- Check if the specified FDCAN interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the FDCAN interrupt source to check. This parameter can be a value of
  - FDCAN_Interrupts

Return value:

- ITStatus

FDCAN Filter Configuration

FDCAN_FILTER_DISABLE

Disable filter element

FDCAN_FILTER_TO_RXFIFO0

Store in Rx FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1

Store in Rx FIFO 1 if filter matches

FDCAN_FILTER_REJECT

Reject ID if filter matches

FDCAN_FILTER_HP

Set high priority if filter matches

FDCAN_FILTER_TO_RXFIFO0_HP

Set high priority and store in FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1_HP

Set high priority and store in FIFO 1 if filter matches

FDCAN Filter Type

FDCAN_FILTER_RANGE

Range filter from FilterID1 to FilterID2

FDCAN_FILTER_DUAL

Dual ID filter for FilterID1 or FilterID2

FDCAN_FILTER_MASK

Classic filter: FilterID1 = filter, FilterID2 = mask

FDCAN_FILTER_RANGE_NO_EIDM

Range filter from FilterID1 to FilterID2, EIDM mask not applied

FDCAN Flags

FDCAN_FLAG_TX_COMPLETE

Transmission Completed

FDCAN_FLAG_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_FLAG_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN_FLAG_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN_FLAG_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_FLAG_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_FLAG_TX_EVT_FIFO_NEW_DATA

Tx Handler wrote Tx Event FIFO element

FDCAN_FLAG_RX_FIFO0_MESSAGE_LOST

Rx FIFO 0 message lost

FDCAN_FLAG_RX_FIFO0_FULL

Rx FIFO 0 full

FDCAN_FLAG_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN_FLAG_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_FLAG_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_FLAG_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN_FLAG_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_FLAG_ERROR_PASSIVE

Error_Passive status changed

FDCAN_FLAG_ERROR_WARNING

Error_Warning status changed

FDCAN_FLAG_BUS_OFF

Bus_Off status changed

FDCAN_FLAG_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_FLAG_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_FLAG_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_FLAG_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN_FLAG_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_FLAG_TIMEOUT_OCCURRED

Timeout reached

FDCAN format

FDCAN_CLASSIC_CAN

Frame transmitted/received in Classic CAN format

FDCAN_FD_CAN

Frame transmitted/received in FDCAN format

FDCAN Frame Format

FDCAN_FRAME_CLASSIC

Classic mode

FDCAN_FRAME_FD_NO_BRS

FD mode without BitRate Switching

FDCAN_FRAME_FD_BRS

FD mode with BitRate Switching

FDCAN Frame Type

FDCAN_DATA_FRAME

Data frame

FDCAN_REMOTE_FRAME

Remote frame

FDCAN High Priority Message Storage

FDCAN_HP_STORAGE_NO_FIFO

No FIFO selected

FDCAN_HP_STORAGE_MSG_LOST

FIFO message lost

FDCAN_HP_STORAGE_RXFIFO0

Message stored in FIFO 0

FDCAN_HP_STORAGE_RXFIFO1

Message stored in FIFO 1

FDCAN ID Type

FDCAN_STANDARD_ID

Standard ID element

FDCAN_EXTENDED_ID

Extended ID element

FDCAN Interrupts Group

FDCAN_IT_GROUP_RX_FIFO0

RX FIFO 0 Interrupts Group: RF0LL: Rx FIFO 0 Message Lost RF0FL: Rx FIFO 0 is Full RF0NL: Rx FIFO 0 Has New Message

FDCAN_IT_GROUP_RX_FIFO1

RX FIFO 1 Interrupts Group: RF1LL: Rx FIFO 1 Message Lost RF1FL: Rx FIFO 1 is Full RF1NL: Rx FIFO 1 Has New Message

FDCAN_IT_GROUP_SMSG

Status Message Interrupts Group: TCFL: Transmission Cancellation Finished TCL: Transmission Completed HPML: High Priority Message

FDCAN_IT_GROUP_TX_FIFO_ERROR

TX FIFO Error Interrupts Group: TEFLL: Tx Event FIFO Element Lost TEFFL: Tx Event FIFO Full TEFNL: Tx Event FIFO New Entry TFEL: Tx FIFO Empty Interrupt Line

FDCAN_IT_GROUP_MISC

Misc. Interrupts Group: TOOL: Timeout Occurred MRAFL: Message RAM Access Failure TSWL: Timestamp Wraparound

FDCAN_IT_GROUP_BIT_LINE_ERROR

Bit and Line Error Interrupts Group: EPL: Error Passive ELOL: Error Logging Overflow

FDCAN_IT_GROUP_PROTOCOL_ERROR

Protocol Error Group: ARAL: Access to Reserved Address Line PEDL: Protocol Error in Data Phase Line PEAL: Protocol Error in Arbitration Phase Line WDIL: Watchdog Interrupt Line BOL: Bus_Off Status EWL: Warning Status

FDCAN Interrupts List

FDCAN_IT_LIST_RX_FIFO0

RX FIFO 0 Interrupts List

FDCAN_IT_LIST_RX_FIFO1

RX FIFO 1 Interrupts List

FDCAN_IT_LIST_SMSG

Status Message Interrupts List

FDCAN_IT_LIST_TX_FIFO_ERROR

TX FIFO Error Interrupts List

FDCAN_IT_LIST_MISC

Misc. Interrupts List

FDCAN_IT_LIST_BIT_LINE_ERROR

Bit and Line Error Interrupts List

FDCAN_IT_LIST_PROTOCOL_ERROR

Protocol Error Interrupts List

FDCAN interrupt line

FDCAN_INTERRUPT_LINE0

Interrupt Line 0

FDCAN_INTERRUPT_LINE1

Interrupt Line 1

FDCAN non-matching frames

FDCAN_ACCEPT_IN_RX_FIFO0

Accept in Rx FIFO 0

FDCAN_ACCEPT_IN_RX_FIFO1

Accept in Rx FIFO 1

FDCAN_REJECT

Reject

FDCAN Operating Mode

FDCAN_MODE_NORMAL

Normal mode

FDCAN_MODE_RESTRICTED_OPERATION

Restricted Operation mode

FDCAN_MODE_BUS_MONITORING

Bus Monitoring mode

FDCAN_MODE_INTERNAL_LOOPBACK

Internal LoopBack mode

FDCAN_MODE_EXTERNAL_LOOPBACK

External LoopBack mode

FDCAN protocol error code

FDCAN_PROTOCOL_ERROR_NONE

No error occurred

FDCAN_PROTOCOL_ERROR_STUFF

Stuff error

FDCAN_PROTOCOL_ERROR_FORM

Form error

FDCAN_PROTOCOL_ERROR_ACK

Acknowledge error

FDCAN_PROTOCOL_ERROR_BIT1

Bit 1 (recessive) error

FDCAN_PROTOCOL_ERROR_BIT0

Bit 0 (dominant) error

FDCAN_PROTOCOL_ERROR_CRC

CRC check sum error

FDCAN_PROTOCOL_ERROR_NO_CHANGE

No change since last read

FDCAN reject remote frames

FDCAN_FILTER_REMOTE

Filter remote frames

FDCAN_REJECT_REMOTE

Reject all remote frames

FDCAN Rx FIFO 0 Interrupts

FDCAN_IT_RX_FIFO0_MESSAGE_LOST

Rx FIFO 0 message lost

FDCAN_IT_RX_FIFO0_FULL

Rx FIFO 0 full

FDCAN_IT_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN Rx FIFO 1 Interrupts

FDCAN_IT_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_IT_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_IT_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN FIFO operation mode

FDCAN_RX_FIFO_BLOCKING

Rx FIFO blocking mode

FDCAN_RX_FIFO_OVERWRITE

Rx FIFO overwrite mode

FDCAN Rx Interrupts

FDCAN_IT_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN Rx Location

FDCAN_RX_FIFO0

Get received message from Rx FIFO 0

FDCAN_RX_FIFO1

Get received message from Rx FIFO 1

FDCAN timeout operation

FDCAN_TIMEOUT_CONTINUOUS

Timeout continuous operation

FDCAN_TIMEOUT_TX_EVENT_FIFO

Timeout controlled by Tx Event FIFO

FDCAN_TIMEOUT_RX_FIFO0

Timeout controlled by Rx FIFO 0

FDCAN_TIMEOUT_RX_FIFO1

Timeout controlled by Rx FIFO 1

FDCAN timestamp

FDCAN_TIMESTAMP_INTERNAL

Timestamp counter value incremented according to TCP

FDCAN_TIMESTAMP_EXTERNAL

External timestamp counter value used

FDCAN timestamp prescaler

FDCAN_TIMESTAMP_PRESC_1

Timestamp counter time unit in equal to CAN bit time

FDCAN_TIMESTAMP_PRESC_2

Timestamp counter time unit in equal to CAN bit time multiplied by 2

FDCAN_TIMESTAMP_PRESC_3

Timestamp counter time unit in equal to CAN bit time multiplied by 3

FDCAN_TIMESTAMP_PRESC_4

Timestamp counter time unit in equal to CAN bit time multiplied by 4

FDCAN_TIMESTAMP_PRESC_5

Timestamp counter time unit in equal to CAN bit time multiplied by 5

FDCAN_TIMESTAMP_PRESC_6

Timestamp counter time unit in equal to CAN bit time multiplied by 6

FDCAN_TIMESTAMP_PRESC_7

Timestamp counter time unit in equal to CAN bit time multiplied by 7

FDCAN_TIMESTAMP_PRESC_8

Timestamp counter time unit in equal to CAN bit time multiplied by 8

FDCAN_TIMESTAMP_PRESC_9

Timestamp counter time unit in equal to CAN bit time multiplied by 9

FDCAN_TIMESTAMP_PRESC_10

Timestamp counter time unit in equal to CAN bit time multiplied by 10

FDCAN_TIMESTAMP_PRESC_11

Timestamp counter time unit in equal to CAN bit time multiplied by 11

FDCAN_TIMESTAMP_PRESC_12

Timestamp counter time unit in equal to CAN bit time multiplied by 12

FDCAN_TIMESTAMP_PRESC_13

Timestamp counter time unit in equal to CAN bit time multiplied by 13

FDCAN_TIMESTAMP_PRESC_14

Timestamp counter time unit in equal to CAN bit time multiplied by 14

FDCAN_TIMESTAMP_PRESC_15

Timestamp counter time unit in equal to CAN bit time multiplied by 15

FDCAN_TIMESTAMP_PRESC_16

Timestamp counter time unit in equal to CAN bit time multiplied by 16

FDCAN Tx FIFO/Queue Mode

FDCAN_TX_FIFO_OPERATION

FIFO mode

FDCAN_TX_QUEUE_OPERATION

Queue mode

FDCAN Tx Event FIFO Interrupts

FDCAN_IT_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_IT_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_IT_TX_EVT_FIFO_NEW_DATA

Tx Handler wrote Tx Event FIFO element

FDCAN Tx Interrupts

FDCAN_IT_TX_COMPLETE

Transmission Completed

FDCAN_IT_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_IT_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN Tx Location

FDCAN_TX_BUFFER0

Add message to Tx Buffer 0

FDCAN_TX_BUFFER1

Add message to Tx Buffer 1

FDCAN_TX_BUFFER2

Add message to Tx Buffer 2

28 HAL FLASH Generic Driver

28.1 FLASH Firmware driver registers structures

28.1.1 FLASH_ProcessTypeDef

FLASH_ProcessTypeDef is defined in the stm32h5xx_hal_flash.h

Data Fields

- ***HAL_LockTypeDef Lock***
- ***uint32_t ErrorCode***
- ***uint32_t ProcedureOnGoing***
- ***uint32_t Address***
- ***uint32_t Bank***
- ***uint32_t Sector***
- ***uint32_t NbSectorsToErase***

Field Documentation

- ***HAL_LockTypeDef FLASH_ProcessTypeDef::Lock***
  FLASH locking object
- ***uint32_t FLASH_ProcessTypeDef::ErrorCode***
  FLASH error code
- ***uint32_t FLASH_ProcessTypeDef::ProcedureOnGoing***
  Internal variable to indicate which procedure is ongoing or not in IT context
- ***uint32_t FLASH_ProcessTypeDef::Address***
  Internal variable to save address selected for program
- ***uint32_t FLASH_ProcessTypeDef::Bank***
  Internal variable to save current bank selected during erase in IT context
- ***uint32_t FLASH_ProcessTypeDef::Sector***
  Internal variable to define the current sector which is erasing
- ***uint32_t FLASH_ProcessTypeDef::NbSectorsToErase***
  Internal variable to save the remaining sectors to erase in IT context

28.2 FLASH Firmware driver API description

The following section lists the various functions of the FLASH library.

28.2.1 FLASH peripheral features

The Flash memory interface manages CPU AHB C-Bus accesses to the Flash memory. It implements the erase and program Flash memory operations and the read and write protection mechanisms.

The FLASH main features are:

- Flash memory read operations
- Flash memory program/erase operations
- Read / write protections
- Option bytes programming
- TrustZone aware
- Watermark-based area protection
- Block-based sector protection
- Error code correction (ECC)

28.2.2 How to use this driver

This driver provides functions and macros to configure and program the FLASH memory of all STM32H5xx devices.

1. FLASH Memory IO Programming functions:
   - Lock and Unlock the FLASH interface using HAL_FLASH_Unlock() and HAL_FLASH_Lock() functions
   - Flash memory programming by 128 bits (user area, OBKeys) and 16 bits (OTP and Flash high-cycle data area)
   - There Two modes of programming :
     - Polling mode using HAL_FLASH_Program() function
     - Interrupt mode using HAL_FLASH_Program_IT() function
2. Interrupts and flags management functions :
   - Handle FLASH interrupts by calling HAL_FLASH_IRQHandler()
   - Callback functions are called when the flash operations are finished : HAL_FLASH_EndOfOperationCallback() when everything is ok, otherwise HAL_FLASH_OperationErrorCallback()
   - Get error flag status by calling HAL_FLASH_GetError()
3. Option bytes management functions :
   - Lock and Unlock the option bytes using HAL_FLASH_OB_Unlock() and HAL_FLASH_OB_Lock() functions
   - Launch the reload of the option bytes using HAL_FLASH_OB_Launch() function. In this case, a reset is generated

In addition to these functions, this driver includes a set of macros allowing to handle the following operations:

- Set the latency
- Enable/Disable the FLASH interrupts
- Monitor the FLASH flags status

Note: The contents of the Flash memory are not guaranteed if a device reset occurs during a Flash memory operation.

28.2.3 Programming operation functions

This subsection provides a set of functions allowing to manage the FLASH program operations.

This section contains the following APIs:

- ***HAL_FLASH_Program()***
- ***HAL_FLASH_Program_IT()***
- ***HAL_FLASH_IRQHandler()***
- ***HAL_FLASH_EndOfOperationCallback()***
- ***HAL_FLASH_OperationErrorCallback()***

28.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the FLASH memory operations.

This section contains the following APIs:

- ***HAL_FLASH_Unlock()***
- ***HAL_FLASH_Lock()***
- ***HAL_FLASH_OB_Unlock()***
- ***HAL_FLASH_OB_Lock()***
- ***HAL_FLASH_OB_Launch()***

28.2.5 Peripheral Errors functions

This subsection permits to get in run-time Errors of the FLASH peripheral.

This section contains the following APIs:

- ***HAL_FLASH_GetError()***

28.2.6 Detailed description of functions

HAL_FLASH_Program

Function name

HAL_StatusTypeDef HAL_FLASH_Program (uint32_t TypeProgram, uint32_t FlashAddress, uint32_t DataAddress)

Function description

Program a quad-word at a specified address.

Parameters

- **TypeProgram:** Indicate the way to program at a specified address. This parameter can be a value of FLASH Program Type
- **FlashAddress:** specifies the address to be programmed. This parameter shall be aligned to the Flash word (128-bit)
- **DataAddress:** specifies the address of data to be programmed This parameter shall be 32-bit aligned

Return values

- **HAL_StatusTypeDef:** HAL Status

HAL_FLASH_Program_IT

Function name

HAL_StatusTypeDef HAL_FLASH_Program_IT (uint32_t TypeProgram, uint32_t FlashAddress, uint32_t DataAddress)

Function description

Program a quad-word at a specified address with interrupt enabled.

Parameters

- **TypeProgram:** Indicate the way to program at a specified address. This parameter can be a value of FLASH Program Type
- **FlashAddress:** specifies the address to be programmed. This parameter shall be aligned to the Flash word (128-bit)
- **DataAddress:** specifies the address of data to be programmed This parameter shall be 32-bit aligned

Return values

- **HAL:** Status

HAL_FLASH_IRQHandler

Function name

void HAL_FLASH_IRQHandler (void)

Function description

This function handles FLASH interrupt request.

Return values

- **None:**

HAL_FLASH_EndOfOperationCallback

Function name

void HAL_FLASH_EndOfOperationCallback (uint32_t ReturnValue)

Function description

FLASH end of operation interrupt callback.

Parameters

- **ReturnValue:** The value saved in this parameter depends on the ongoing procedure Mass Erase: Bank number which has been requested to erase Sectors Erase: Sector which has been erased (if 0xFFFFFFFF, it means that all the selected sectors have been erased) Program: Address which was selected for data program

Return values

- **None:**

HAL_FLASH_OperationErrorCallback

Function name

void HAL_FLASH_OperationErrorCallback (uint32_t ReturnValue)

Function description

FLASH operation error interrupt callback.

Parameters

- **ReturnValue:** The value saved in this parameter depends on the ongoing procedure Mass Erase: Bank number which has been requested to erase Sectors Erase: Sector number which returned an error Program: Address which was selected for data program

Return values

- **None:**

HAL_FLASH_Unlock

Function name

HAL_StatusTypeDef HAL_FLASH_Unlock (void)

Function description

Unlock the FLASH control registers access.

Return values

- **HAL:** Status

HAL_FLASH_Lock

Function name

HAL_StatusTypeDef HAL_FLASH_Lock (void)

Function description

Locks the FLASH control registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Unlock

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Unlock (void)

Function description

Unlock the FLASH Option Control Registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Lock

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Lock (void)

Function description

Lock the FLASH Option Control Registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Launch

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Launch (void)

Function description

Launch the option bytes loading.

Return values

- **HAL:** Status

HAL_FLASH_GetError

Function name

uint32_t HAL_FLASH_GetError (void)

Function description

Get the specific FLASH error flag.

Return values

- **HAL_FLASH_ERRORCode:** The returned value can be:
  - HAL_FLASH_ERROR_NONE : No error set
  - HAL_FLASH_ERROR_WRP : Write Protection Error
  - HAL_FLASH_ERROR_PGS : Program Sequence Error
  - HAL_FLASH_ERROR_STRB : Strobe Error
  - HAL_FLASH_ERROR_INC : Inconsistency Error
  - HAL_FLASH_ERROR_OBK : OBK Error
  - HAL_FLASH_ERROR_OBKW : OBK Write Error
  - HAL_FLASH_ERROR_OB_CHANGE : Option Byte Change Error
  - HAL_FLASH_ERROR_ECCC : ECC Single Correction Error
  - HAL_FLASH_ERROR_ECCD : ECC Double Detection Error

FLASH_WaitForLastOperation

Function name

HAL_StatusTypeDef FLASH_WaitForLastOperation (uint32_t Timeout)

Function description

Wait for a FLASH operation to complete.

Parameters

- **Timeout:** maximum flash operation timeout

Return values

- **HAL_StatusTypeDef:** HAL Status

28.3 FLASH Firmware driver defines

The following section lists the various define and macros of the module.

28.3.1 FLASH

FLASH

FLASH Banks

FLASH_BANK_1

Bank 1

FLASH_BANK_2

Bank 2

FLASH_BANK_BOTH

Bank1 and Bank2

FLASH Block-Base Attributes

FLASH_BB_SEC

Flash Block-Based Security Attributes

FLASH_BB_PRIV

Flash Block-Based Privilege Attributes

FLASH Error Code

HAL_FLASH_ERROR_NONE

No error

HAL_FLASH_ERROR_WRP

Write Protection Error

HAL_FLASH_ERROR_PGS

Program Sequence Error

HAL_FLASH_ERROR_STRB

Strobe Error

HAL_FLASH_ERROR_INC

Inconsistency Error

HAL_FLASH_ERROR_OBK

OBK Error

HAL_FLASH_ERROR_OBKW

OBK Write Error

HAL_FLASH_ERROR_OB_CHANGE

Option Byte Change Error

HAL_FLASH_ERROR_ECCC

ECC Single Correction Error

HAL_FLASH_ERROR_ECCD

ECC Double Detection Error

FLASH Exported Macros

__HAL_FLASH_SET_LATENCY

Description:

- Set the FLASH Latency.

Parameters:

- __LATENCY__: FLASH Latency This parameter can be one of the following values :
  - FLASH_LATENCY_0: FLASH Zero wait state
  - FLASH_LATENCY_1: FLASH One wait state
  - FLASH_LATENCY_2: FLASH Two wait states
  - FLASH_LATENCY_3: FLASH Three wait states
  - FLASH_LATENCY_4: FLASH Four wait states
  - FLASH_LATENCY_5: FLASH Five wait states
  - FLASH_LATENCY_6: FLASH Six wait states
  - FLASH_LATENCY_7: FLASH Seven wait states
  - FLASH_LATENCY_8: FLASH Eight wait states
  - FLASH_LATENCY_9: FLASH Nine wait states
  - FLASH_LATENCY_10: FLASH Ten wait states
  - FLASH_LATENCY_11: FLASH Eleven wait states
  - FLASH_LATENCY_12: FLASH Twelve wait states
  - FLASH_LATENCY_13: FLASH Thirteen wait states
  - FLASH_LATENCY_14: FLASH Fourteen wait states
  - FLASH_LATENCY_15: FLASH Fifteen wait states

Return value:

- none

__HAL_FLASH_GET_LATENCY

Description:

- Get the FLASH Latency.

Return value:

- FLASH: Latency This return value can be one of the following values :
  - FLASH_LATENCY_0: FLASH Zero wait state
  - FLASH_LATENCY_1: FLASH One wait state
  - FLASH_LATENCY_2: FLASH Two wait states
  - FLASH_LATENCY_3: FLASH Three wait states
  - FLASH_LATENCY_4: FLASH Four wait states
  - FLASH_LATENCY_5: FLASH Five wait states
  - FLASH_LATENCY_6: FLASH Six wait states
  - FLASH_LATENCY_7: FLASH Seven wait states
  - FLASH_LATENCY_8: FLASH Eight wait states
  - FLASH_LATENCY_9: FLASH Nine wait states
  - FLASH_LATENCY_10: FLASH Ten wait states
  - FLASH_LATENCY_11: FLASH Eleven wait states
  - FLASH_LATENCY_12: FLASH Twelve wait states
  - FLASH_LATENCY_13: FLASH Thirteen wait states
  - FLASH_LATENCY_14: FLASH Fourteen wait states
  - FLASH_LATENCY_15: FLASH Fifteen wait states

__HAL_FLASH_ENABLE_IT

Description:

- Enable the specified FLASH interrupt.

Parameters:

- __INTERRUPT__: : FLASH interrupt This parameter can be any combination of the following values:
  - FLASH_IT_EOP : End of FLASH Operation Interrupt
  - FLASH_IT_WRPERR : Write Protection Error Interrupt
  - FLASH_IT_PGSERR : Program Sequence Error Interrupt
  - FLASH_IT_STRBERR : Strobe Error Interrupt
  - FLASH_IT_INCERR : Inconsistency Error Interrupt
  - FLASH_IT_OBKERR : OBK Error Interrupt
  - FLASH_IT_OBKWERR : OBK Write Error Interrupt
  - FLASH_IT_OPTCHANGEERR : Option Byte Change Error Interrupt
  - FLASH_IT_ECCC : Single ECC Error Correction Interrupt

Return value:

- none

__HAL_FLASH_ENABLE_IT_NS

__HAL_FLASH_DISABLE_IT

Description:

- Disable the specified FLASH interrupt.

Parameters:

- __INTERRUPT__: : FLASH interrupt This parameter can be any combination of the following values:
  - FLASH_IT_EOP : End of FLASH Operation Interrupt
  - FLASH_IT_WRPERR : Write Protection Error Interrupt
  - FLASH_IT_PGSERR : Program Sequence Error Interrupt
  - FLASH_IT_STRBERR : Strobe Error Interrupt
  - FLASH_IT_INCERR : Inconsistency Error Interrupt
  - FLASH_IT_OBKERR : OBK Error Interrupt
  - FLASH_IT_OBKWERR : OBK Write Error Interrupt
  - FLASH_IT_OPTCHANGEERR : Option Byte Change Error Interrupt
  - FLASH_IT_ECCC : Single ECC Error Correction Interrupt

Return value:

- none

__HAL_FLASH_DISABLE_IT_NS

__HAL_FLASH_GET_FLAG

Description:

- Checks whether the specified FLASH flag is set or not.

Parameters:

- __FLAG__: specifies the FLASH flag to check. This parameter can be one of the following values :
  - FLASH_FLAG_BSY : FLASH Busy flag
  - FLASH_FLAG_WBNE : Write Buffer Not Empty flag
  - FLASH_FLAG_EOP : End Of Operation flag
  - FLASH_FLAG_WRPERR : Write Protection Error flag
  - FLASH_FLAG_PGSERR : Program Sequence Error flag
  - FLASH_FLAG_STRBERR : Strobe Error flag
  - FLASH_FLAG_INCERR : Inconsistency Error flag
  - FLASH_FLAG_OBKERR : OBK Error flag
  - FLASH_FLAG_OBKWERR : OBK Write Error flag
  - FLASH_FLAG_OPTCHANGEERR : Option Byte Change Error flag
  - FLASH_FLAG_ECCC : Single ECC Error Correction flag
  - FLASH_FLAG_ECCD : Double Detection ECC Error flag

Return value:

- The: new state of FLASH_FLAG (SET or RESET).

__HAL_FLASH_GET_FLAG_NS

__HAL_FLASH_CLEAR_FLAG

Description:

- Clear the specified FLASH flag.

Parameters:

- __FLAG__: specifies the FLASH flags to clear. This parameter can be one of the following values :
  - FLASH_FLAG_BSY : FLASH Busy flag
  - FLASH_FLAG_WBNE : Write Buffer Not Empty flag
  - FLASH_FLAG_EOP : End Of Operation flag
  - FLASH_FLAG_WRPERR : Write Protection Error flag
  - FLASH_FLAG_PGSERR : Program Sequence Error flag
  - FLASH_FLAG_STRBERR : Strobe Error flag
  - FLASH_FLAG_INCERR : Inconsistency Error flag
  - FLASH_FLAG_OBKERR : OBK Error flag
  - FLASH_FLAG_OBKWERR : OBK Write Error flag
  - FLASH_FLAG_OPTCHANGEERR : Option Byte Change Error flag
  - FLASH_FLAG_ECCC : Single ECC Error Correction flag
  - FLASH_FLAG_ECCD : Double Detection ECC Error flag
  - FLASH_FLAG_ALL_ERRORS: All errors flags

Return value:

- none

__HAL_FLASH_CLEAR_FLAG_NS

FLASH Type Erase

FLASH_TYPEERASE_SECTORS

Secure flash sectors erase activation

FLASH_TYPEERASE_SECTORS_NS

Non-secure flash sectors erase activation

FLASH_TYPEERASE_MASSERASE

Secure flash mass erase activation

FLASH_TYPEERASE_MASSERASE_NS

Non-secure flash mass erase activation

FLASH_TYPEERASE_OBK_ALT

Flash OBK erase activation

FLASH Program Type

FLASH_TYPEPROGRAM_QUADWORD

Program a quad-word (128-bit) at a specified secure address

FLASH_TYPEPROGRAM_QUADWORD_NS

Program a quad-word (128-bit) at a specified non-secure address

FLASH_TYPEPROGRAM_QUADWORD_OBK

Program a quad-word (128-bit) of OBK to current sector

FLASH_TYPEPROGRAM_QUADWORD_OBK_ALT

Program a quad-word (128-bit) of OBK to alternate sector

FLASH_TYPEPROGRAM_HALFWORD_EDATA

Program a flash high-cycle data half-word (16-bit)at a specified secure address

FLASH_TYPEPROGRAM_HALFWORD_EDATA_NS

Program a flash high-cycle data half-word (16-bit)at a specified non-secure address

FLASH_TYPEPROGRAM_HALFWORD_OTP

Program an OTP half-word (16-bit)at a specified address

FLASH WRP State

OB_WRPSTATE_DISABLE

Disable the write protection of the desired flash sectors

OB_WRPSTATE_ENABLE

Enable the write protection of the desired flash sectors

29 HAL FLASH Extension Driver

29.1 FLASHEx Firmware driver registers structures

29.1.1 FLASH_EraseInitTypeDef

FLASH_EraseInitTypeDef is defined in the stm32h5xx_hal_flash_ex.h

Data Fields

- ***uint32_t TypeErase***
- ***uint32_t Banks***
- ***uint32_t Sector***
- ***uint32_t NbSectors***

Field Documentation

- ***uint32_t FLASH_EraseInitTypeDef::TypeErase***
  Mass erase or sector Erase. This parameter can be a value of ***FLASH_Type_Erase***
- ***uint32_t FLASH_EraseInitTypeDef::Banks***
  Select banks to erase when Mass erase is enabled. This parameter can be a value of ***FLASH_Banks*** (FLASH_BANK_BOTH should be used only for mass erase)
- ***uint32_t FLASH_EraseInitTypeDef::Sector***
  Initial FLASH sector to erase when Mass erase is disabled This parameter can be a value of ***FLASH_Sectors***
- ***uint32_t FLASH_EraseInitTypeDef::NbSectors***
  Number of sectors to be erased. This parameter can be a value between 1 and (max number of sectors in the bank - value of initial sector)

29.1.2 FLASH_OBProgramInitTypeDef

FLASH_OBProgramInitTypeDef is defined in the stm32h5xx_hal_flash_ex.h

Data Fields

- ***uint32_t OptionType***
- ***uint32_t ProductState***
- ***uint32_t USERType***
- ***uint32_t USERConfig***
- ***uint32_t USERConfig2***
- ***uint32_t Banks***
- ***uint32_t WRPState***
- ***uint32_t WRPSector***
- ***uint32_t BootConfig***
- ***uint32_t BootAddr***
- ***uint32_t BootLock***
- ***uint32_t OTPBlockLock***
- ***uint32_t HDPStartSector***
- ***uint32_t HDPEndSector***
- ***uint32_t EDATASize***
- ***uint32_t WMSecStartSector***
- ***uint32_t WMSecEndSector***

Field Documentation

- ***uint32_t FLASH_OBProgramInitTypeDef::OptionType***
  Option byte to be configured. This parameter can be a value of ***FLASH_Option_Type***
- ***uint32_t FLASH_OBProgramInitTypeDef::ProductState***
  Set the product state. This parameter can be a value of ***FLASH_OB_Product_State***

- ***uint32_t FLASH_OBProgramInitTypeDef::USERType***
  Select the User Option Byte(s) to be configured (used for OPTIONBYTE_USER). This parameter can be a combination of ***FLASH_OB_USER_Type***
- ***uint32_t FLASH_OBProgramInitTypeDef::USERConfig***
  Value of the User Option Byte (used for OPTIONBYTE_USER). This parameter can be a combination of ***FLASH_OB_USER_BOR_LEVEL***, ***FLASH_OB_USER_BORH_EN***, ***FLASH_OB_USER_IWDG_SW***, ***FLASH_OB_USER_WWDG_SW***, ***FLASH_OB_USER_nRST_STOP***, ***FLASH_OB_USER_nRST_STANDBY***, ***FLASH_OB_USER_IO_VDD_HSLV***, ***FLASH_OB_USER_IO_VDDIO2_HSLV***, ***FLASH_OB_USER_IWDG_STOP***, ***FLASH_OB_USER_IWDG_STANDBY***, ***FLASH_OB_USER_BOOT_UBE***, ***FLASH_OB_USER_SWAP_BANK***
- ***uint32_t FLASH_OBProgramInitTypeDef::USERConfig2***
  Value of the User Option Byte (used for OPTIONBYTE_USER). This parameter can be a combination of ***FLASH_OB_USER_SRAM1_3_RST***, ***FLASH_OB_USER_SRAM2_RST***, ***FLASH_OB_USER_BKPRAM_ECC***, ***FLASH_OB_USER_SRAM3_ECC***, ***FLASH_OB_USER_SRAM2_ECC***, ***Section 28.3.1 FLASH_OB_USER_SRAM1_RST***, ***Section 28.3.1 FLASH_OB_USER_SRAM1_ECC***, ***FLASH_OB_USER_TZEN***
- ***uint32_t FLASH_OBProgramInitTypeDef::Banks***
  Select banks for WRP , HDP and secure area configuration. This parameter must be a value of ***FLASH_Banks***
- ***uint32_t FLASH_OBProgramInitTypeDef::WRPState***
  Write protection activation or deactivation. This parameter can be a value of ***FLASH_WRP_State***
- ***uint32_t FLASH_OBProgramInitTypeDef::WRPSector***
  Specifies the sector(s) to be write protected. The value of this parameter depend on device used within the same series
- ***uint32_t FLASH_OBProgramInitTypeDef::BootConfig***
  Specifies if the Boot Address to be configured: secure or non-secure. This parameter must be a value of ***FLASH_OB_BOOT_CONFIG*** enumeration
- ***uint32_t FLASH_OBProgramInitTypeDef::BootAddr***
  Boot address (used for OPTIONBYTE_BOOTADDR). This parameter must be a value between 0x0 and 0xFFFFFF00
- ***uint32_t FLASH_OBProgramInitTypeDef::BootLock***
  Configuration of the boot lock (used for OPTIONBYTE_BOOT_LOCK). This parameter must be a value of ***FLASH_OB_BOOT_LOCK***
- ***uint32_t FLASH_OBProgramInitTypeDef::OTPBlockLock***
  Specifies the OTP block(s) to be locked. This parameter must be a value of ***FLASH_OTP_Blocks***
- ***uint32_t FLASH_OBProgramInitTypeDef::HDPStartSector***
  Start sector of HDP area (used for OPTIONBYTE_HDP). This parameter must be a value between 0 and (max number of sectors in the bank - 1)
- ***uint32_t FLASH_OBProgramInitTypeDef::HDPEndSector***
  End sector of HDP area (used for OPTIONBYTE_HDP). This parameter must be a value between 0 and (max number of sectors in the bank - 1)
- ***uint32_t FLASH_OBProgramInitTypeDef::EDATASize***
  Specifies the number of Flash high-cycle sectors. This parameter must be a value between 0 and 8 (sectors)
- ***uint32_t FLASH_OBProgramInitTypeDef::WMSecStartSector***
  Start sector of secure area (used for OPTIONBYTE_WMSEC). This parameter must be a value between 0 and (max number of sectors in the bank - 1)
- ***uint32_t FLASH_OBProgramInitTypeDef::WMSecEndSector***
  End sector of secure area (used for OPTIONBYTE_WMSEC). This parameter must be a value between 0 and (max number of sectors in the bank - 1)

29.1.3 FLASH_BBAttributesTypeDef

FLASH_BBAttributesTypeDef is defined in the stm32h5xx_hal_flash_ex.h

Data Fields

- ***uint32_t Bank***
- ***uint32_t BBAttributesType***

- ***uint32_t BBAttributes_array***

Field Documentation

- ***uint32_t FLASH_BBAttributesTypeDef::Bank***
  Selection of the associated bank of Block-based Area. This parameter must be a value of ***FLASH_Banks***
- ***uint32_t FLASH_BBAttributesTypeDef::BBAttributesType***
  Block-Based Attributes type. This parameter must be a value of ***FLASH_BB_Attributes***
- ***uint32_t FLASH_BBAttributesTypeDef::BBAttributes_array[FLASH_BLOCKBASED_NB_REG]***
  Each bit specifies the block-based attribute configuration of a sector: 0 means sector non-protected, 1 means sector protected. Protection (secure or privilege) depends on BBAttributesType value

29.1.4 FLASH_OperationTypeDef

FLASH_OperationTypeDef is defined in the stm32h5xx_hal_flash_ex.h

Data Fields

- ***uint32_t OperationType***
- ***uint32_t FlashArea***
- ***uint32_t Address***

Field Documentation

- ***uint32_t FLASH_OperationTypeDef::OperationType***
  Flash operation Type. This parameter must be a value of ***FLASH_Operation_Type***
- ***uint32_t FLASH_OperationTypeDef::FlashArea***
  Flash operation memory area. This parameter must be a value of ***FLASH_Operation_Area***
- ***uint32_t FLASH_OperationTypeDef::Address***
  Flash operation Address offset. This parameter is given by bank, and must be a value between 0x0 and 0xFFFF0

29.1.5 FLASH_HDPExtensionTypeDef

FLASH_HDPExtensionTypeDef is defined in the stm32h5xx_hal_flash_ex.h

Data Fields

- ***uint32_t Banks***
- ***uint32_t NbSectors***

Field Documentation

- ***uint32_t FLASH_HDPExtensionTypeDef::Banks***
  Selection of the associated bank of HDP Area. This parameter must be a value of ***FLASH_Banks***
- ***uint32_t FLASH_HDPExtensionTypeDef::NbSectors***
  Number of sectors to be HDP extended. This parameter can be a value between 1 and max number of sectors in the bank

29.2 FLASHEx Firmware driver API description

The following section lists the various functions of the FLASHEx library.

29.2.1 Flash Extension features

Comparing to other previous devices, the FLASH interface for STM32H5xx devices contains the following additional features

- Capacity up to 2 Mbyte with dual bank architecture supporting read-while-write capability (RWW)
- Dual bank memory organization
- Product State protection
- Write protection
- Secure access only protection
- Bank / register swapping (when Dual-Bank)
- Watermark-based secure protection
- Block-based secure protection
- Block-based privilege protection

- Hide Protection areas

29.2.2 How to use this driver

This driver provides functions to configure and program the FLASH memory of all STM32H5xx devices. It includes

1. FLASH Memory Erase functions:
   - Lock and Unlock the FLASH interface using HAL_FLASH_Unlock() and HAL_FLASH_Lock() functions
   - Erase function: Sector erase, bank erase and dual-bank mass erase
   - There are two modes of erase :
     - Polling Mode using HAL_FLASHEx_Erase()
     - Interrupt Mode using HAL_FLASHEx_Erase_IT()
2. Option Bytes Programming functions: Use HAL_FLASHEx_OBProgram() to:
   - Configure the write protection per bank
   - Set the Product State
   - Program the user Option Bytes
   - Configure the watermark security for each area
   - Configure the Hide protection areas
   - Configure the Boot addresses
3. Get Option Bytes Configuration function: Use HAL_FLASHEx_OBGetConfig() to:
   - Get the value of a write protection area
   - Get the Product State
   - Get the value of the user Option Bytes
   - Get the configuration of watermark security areas
   - Get the configuration of Hide protection areas
   - Get the value of a boot address
4. Block-based secure / privilege area configuration function: Use HAL_FLASHEx_ConfigBBAttributes()
   - Bit-field allowing to secure or un-secure each sector
   - Bit-field allowing to privilege or un-privilege each sector
5. Get the block-based secure / privilege area configuration function: Use HAL_FLASHEx_GetConfigBBAttributes()
   - Return the configuration of the block-based security and privilege for all the sectors
6. Privilege mode configuration function: Use HAL_FLASHEx_ConfigPrivMode()
   - FLASH register can be protected against non-privilege accesses
7. Get the privilege mode configuration function: Use HAL_FLASHEx_GetPrivMode()
   - Return if the FLASH registers are protected against non-privilege accesses

29.2.3 Extended programming operation functions

This subsection provides a set of functions allowing to manage the Extended FLASH programming operations Operations.

This section contains the following APIs:

- ***HAL_FLASHEx_Erase()***
- ***HAL_FLASHEx_Erase_IT()***
- ***HAL_FLASHEx_OBProgram()***
- ***HAL_FLASHEx_OBGetConfig()***
- ***HAL_FLASHEx_OBK_Unlock()***
- ***HAL_FLASHEx_OBK_Lock()***
- ***HAL_FLASHEx_OBK_Swap()***
- ***HAL_FLASHEx_GetOperation()***

29.2.4 Detailed description of functions

HAL_FLASHEx_Erase

Function name

HAL_StatusTypeDef HAL_FLASHEx_Erase (FLASH_EraseInitTypeDef * pEraseInit, uint32_t * SectorError)

Function description

Perform a mass erase or erase the specified FLASH memory sectors.

Parameters

- **pEraseInit:** pointer to an FLASH_EraseInitTypeDef structure that contains the configuration information for the erasing.
- **SectorError:** pointer to variable that contains the configuration information on faulty sector in case of error (0xFFFFFFFF means that all the sectors have been correctly erased).

Return values

- **HAL:** Status

HAL_FLASHEx_Erase_IT

Function name

HAL_StatusTypeDef HAL_FLASHEx_Erase_IT (FLASH_EraseInitTypeDef * pEraseInit)

Function description

Perform a mass erase or erase the specified FLASH memory sectors with interrupt enabled.

Parameters

- **pEraseInit:** pointer to an FLASH_EraseInitTypeDef structure that contains the configuration information for the erasing.

Return values

- **HAL:** Status

HAL_FLASHEx_OBProgram

Function name

HAL_StatusTypeDef HAL_FLASHEx_OBProgram (FLASH_OBProgramInitTypeDef * pOBInit)

Function description

Program option bytes.

Parameters

- **pOBInit:** pointer to an FLASH_OBInitStruct structure that contains the configuration information for the programming.

Return values

- **HAL:** Status

Notes

- To configure any option bytes, the option lock bit OPTLOCK must be cleared with the call of HAL_FLASH_OB_Unlock() function.
- New option bytes configuration will be taken into account in two cases: after an option bytes launch through the call of HAL_FLASH_OB_Launch()after a power-on reset (BOR reset or exit from Standby/ Shutdown modes)

HAL_FLASHEx_OBGetConfig

Function name

void HAL_FLASHEx_OBGetConfig (FLASH_OBProgramInitTypeDef * pOBInit)

Function description

Get the Option byte configuration.

Parameters

- **pOBInit:** pointer to an FLASH_OBInitStruct structure that contains the configuration information for the programming.

Return values

- **None:**

Notes

- The parameter Banks of the pOBInit structure must be set exclusively to FLASH_BANK_1 or FLASH_BANK_2, as this parameter is use to get the given Bank WRP, PCROP and secured area configuration.

HAL_FLASHEx_OBK_Unlock

Function name

HAL_StatusTypeDef HAL_FLASHEx_OBK_Unlock (void)

Function description

Unlock the FLASH OBK register access.

Return values

- **HAL:** Status

HAL_FLASHEx_OBK_Lock

Function name

HAL_StatusTypeDef HAL_FLASHEx_OBK_Lock (void)

Function description

Locks the FLASH OBK register access.

Return values

- **HAL:** Status

HAL_FLASHEx_OBK_Swap

Function name

HAL_StatusTypeDef HAL_FLASHEx_OBK_Swap (uint32_t SwapOffset)

Function description

Swap the FLASH Option Bytes Keys (OBK)

Parameters

- **SwapOffset:** Specifies the number of keys to be swapped. This parameter can be a value between 0 (no OBK data swapped) and 511 (all OBK data swapped). Typical value are available in FLASH OBK Swap Offset

Return values

- **HAL:** Status

HAL_FLASHEx_GetOperation

Function name

void HAL_FLASHEx_GetOperation (FLASH_OperationTypeDef * pFlashOperation)

Function description

Return the on-going Flash Operation.

Parameters

- **pFlashOperation:** [out] pointer to a FLASH_OperationTypeDef structure that contains the Flash operation information.

Return values

- **None:**

HAL_FLASHEx_ConfigBBAttributes

Function name

HAL_StatusTypeDef HAL_FLASHEx_ConfigBBAttributes (FLASH_BBAttributesTypeDef * pBBAttributes)

Function description

Configure the block-based secure area.

Parameters

- **pBBAttributes:** pointer to an FLASH_BBAttributesTypeDef structure that contains the configuration information for the programming.

Return values

- **HAL:** Status

Notes

- The field pBBAttributes->Bank should indicate which area is requested for the block-based attributes.
- The field pBBAttributes->BBAttributesType should indicate which block-base attribute type is requested: Secure or Privilege.

HAL_FLASHEx_GetConfigBBAttributes

Function name

void HAL_FLASHEx_GetConfigBBAttributes (FLASH_BBAttributesTypeDef * pBBAttributes)

Function description

Return the block-based attributes.

Parameters

- **pBBAttributes:** [in/out] pointer to an FLASH_BBAttributesTypeDef structure that contains the configuration information.

Return values

- **None:**

Notes

- The field pBBAttributes->Bank should indicate which area is requested for the block-based attributes.
- The field pBBAttributes->BBAttributesType should indicate which block-base attribute type is requested: Secure or Privilege.

HAL_FLASHEx_ConfigPrivMode

Function name

void HAL_FLASHEx_ConfigPrivMode (uint32_t PrivMode)

Function description

Configuration of the privilege attribute.

Parameters

- **PrivMode:** indicate privilege mode configuration This parameter can be one of the following values:
  - FLASH_SPRIV_GRANTED: access to secure Flash registers is granted to privileged or unprivileged access
  - FLASH_SPRIV_DENIED: access to secure Flash registers is denied to unprivileged access
  - FLASH_NSPRIV_GRANTED: access to non-secure Flash registers is granted to privileged or unprivileged access
  - FLASH_NSPRIV_DENIED: access to non-secure Flash registers is denied to unprivilege access

Return values

- **None:**

HAL_FLASHEx_GetPrivMode

Function name

uint32_t HAL_FLASHEx_GetPrivMode (void)

Function description

Return the value of the privilege attribute.

Return values

- **It:** indicates the privilege mode configuration. This return value can be one of the following values:
  - FLASH_SPRIV_GRANTED: access to secure Flash registers is granted to privileged or unprivileged access
  - FLASH_SPRIV_DENIED: access to secure Flash registers is denied to unprivileged access
  - FLASH_NSPRIV_GRANTED: access to non-secure Flash registers is granted to privileged or unprivileged access
  - FLASH_NSPRIV_DENIED: access to Flash registers is denied to unprivilege accessP

HAL_FLASHEx_ConfigSecInversion

Function name

HAL_StatusTypeDef HAL_FLASHEx_ConfigSecInversion (uint32_t SecInvState)

Function description

Configuration of the security inversion.

Parameters

- **SecInvState:** indicate the flash security state configuration This parameter can be one of the following values:
  - FLASH_SEC_INV_DISABLE: Security state of Flash is not inverted
  - FLASH_SEC_INV_ENABLE: Security state of Flash is inverted

Return values

- **HAL:** Status

HAL_FLASHEx_GetSecInversion

Function name

uint32_t HAL_FLASHEx_GetSecInversion (void)

Function description

Return the value of the security inversion.

Return values

- **It:** indicates the flash security state configuration This return value can be one of the following values:
  - FLASH_SEC_INV_DISABLE: Security state of Flash is not inverted
  - FLASH_SEC_INV_ENABLE: Security state of Flash is inverted

HAL_FLASHEx_ConfigHDPExtension

Function name

HAL_StatusTypeDef HAL_FLASHEx_ConfigHDPExtension (const FLASH_HDPExtensionTypeDef * pHDPExtension)

Function description

Configure the HDP extension area.

Parameters

- **pHDPExtension:** pointer to an FLASH_HDPExtentionTypeDef structure that contains the configuration information.

Return values

- **HAL:** Status

Notes

- The field pHDPExtension->Banks should indicate which area is requested for the HDP extension.
- The field pHDPExtension->NbSectors should indicate the number of sector to be added to the HDP area.

FLASH_Erase_Sector

Function name

void FLASH_Erase_Sector (uint32_t Sector, uint32_t Banks)

Function description

Erase the specified FLASH memory sector.

Parameters

- **Sector:** FLASH sector to erase This parameter can be a value of FLASH Sectors
- **Banks:** Bank(s) where the sector will be erased This parameter can be one of the following values:
  - FLASH_BANK_1: Sector in bank 1 to be erased
  - FLASH_BANK_2: Sector in bank 2 to be erased

Return values

- **None:**

29.3 FLASHEx Firmware driver defines

The following section lists the various define and macros of the module.

29.3.1 FLASHEx

FLASHEx

FLASHEx Exported Macros

__HAL_FLASH_PREFETCH_BUFFER_ENABLE

Description:

- Enable the FLASH prefetch buffer.

Return value:

- None

__HAL_FLASH_PREFETCH_BUFFER_DISABLE

Description:

- Disable the FLASH prefetch buffer.

Return value:

- None

__HAL_FLASH_SMART_PREFETCH_BUFFER_ENABLE

Description:

- Enable the FLASH smart prefetch buffer.

Return value:

- None

__HAL_FLASH_SMART_PREFETCH_BUFFER_DISABLE

Description:

- Disable the FLASH smart prefetch buffer.

Return value:

- None

__HAL_FLASH_SET_PROGRAM_DELAY

Description:

- Set the FLASH Programming Delay.

Parameters:

- __DELAY__: FLASH Programming Delay This parameter can be a value of

Return value:

- none

__HAL_FLASH_GET_PROGRAM_DELAY

Description:

- Get the FLASH Programming Delay.

Return value:

- FLASH: Programming Delay This return value can be a value of

FLASHEx Private macros to check input parameters

30 HAL FMAC Generic Driver

30.1 FMAC Firmware driver registers structures

30.1.1 __FMAC_HandleTypeDef

__FMAC_HandleTypeDef is defined in the stm32h5xx_hal_fmac.h

Data Fields

- ***FMAC_TypeDef * Instance***
- ***uint32_t FilterParam***
- ***uint8_t InputAccess***
- ***uint8_t OutputAccess***
- ***int16_t * pInput***
- ***uint16_t InputCurrentSize***
- ***uint16_t * pInputSize***
- ***int16_t * pOutput***
- ***uint16_t OutputCurrentSize***
- ***uint16_t * pOutputSize***
- ***DMA_HandleTypeDef * hdmaIn***
- ***DMA_HandleTypeDef * hdmaOut***
- ***DMA_HandleTypeDef * hdmaPreload***
- ***void(* ErrorCallback***
- ***void(* HalfGetDataCallback***
- ***void(* GetDataCallback***
- ***void(* HalfOutputDataReadyCallback***
- ***void(* OutputDataReadyCallback***
- ***void(* FilterConfigCallback***
- ***void(* FilterPreloadCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_FMAC_StateTypeDef State***
- ***__IO HAL_FMAC_StateTypeDef RdState***
- ***__IO HAL_FMAC_StateTypeDef WrState***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***FMAC_TypeDef* __FMAC_HandleTypeDef::Instance***
  Register base address
- ***uint32_t __FMAC_HandleTypeDef::FilterParam***
  Filter configuration (operation and parameters). Set to 0 if no valid configuration was applied.
- ***uint8_t __FMAC_HandleTypeDef::InputAccess***
  Access to the input buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint8_t __FMAC_HandleTypeDef::OutputAccess***
  Access to the output buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***int16_t* __FMAC_HandleTypeDef::pInput***
  Pointer to FMAC input data buffer
- ***uint16_t __FMAC_HandleTypeDef::InputCurrentSize***
  Number of the input elements already written into FMAC

- ***uint16_t* __FMAC_HandleTypeDef::pInputSize***
  Number of input elements to write (memory allocated to pInput). In case of early interruption of the filter operation, its value will be updated.
- ***int16_t* __FMAC_HandleTypeDef::pOutput***
  Pointer to FMAC output data buffer
- ***uint16_t __FMAC_HandleTypeDef::OutputCurrentSize***
  Number of the output elements already read from FMAC
- ***uint16_t* __FMAC_HandleTypeDef::pOutputSize***
  Number of output elements to read (memory allocated to pOutput). In case of early interruption of the filter operation, its value will be updated.
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaIn***
  FMAC peripheral input data DMA handle parameters
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaOut***
  FMAC peripheral output data DMA handle parameters
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaPreload***
  FMAC peripheral preloaded data (X1, X2 and Y) DMA handle parameters
- ***void(* __FMAC_HandleTypeDef::ErrorCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC error callback
- ***void(* __FMAC_HandleTypeDef::HalfGetDataCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC get half data callback
- ***void(* __FMAC_HandleTypeDef::GetDataCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC get data callback
- ***void(* __FMAC_HandleTypeDef::HalfOutputDataReadyCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC half output data ready callback
- ***void(* __FMAC_HandleTypeDef::OutputDataReadyCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC output data ready callback
- ***void(* __FMAC_HandleTypeDef::FilterConfigCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC filter configuration callback
- ***void(* __FMAC_HandleTypeDef::FilterPreloadCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC filter preload callback
- ***void(* __FMAC_HandleTypeDef::MspInitCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC Msp Init callback
- ***void(* __FMAC_HandleTypeDef::MspDeInitCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC Msp DeInit callback
- ***HAL_LockTypeDef __FMAC_HandleTypeDef::Lock***
  FMAC locking object
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::State***
  FMAC state related to global handle management This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::RdState***
  FMAC state related to read operations (access to Y buffer) This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::WrState***
  FMAC state related to write operations (access to X1 buffer) This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO uint32_t __FMAC_HandleTypeDef::ErrorCode***
  FMAC peripheral error code This parameter can be a value of *FMAC_Error_Code*

30.1.2 FMAC_FilterConfigTypeDef

FMAC_FilterConfigTypeDef is defined in the stm32h5xx_hal_fmac.h

Data Fields

- ***uint8_t InputBaseAddress***
- ***uint8_t InputBufferSize***
- ***uint32_t InputThreshold***

- ***uint8_t CoeffBaseAddress***
- ***uint8_t CoeffBufferSize***
- ***uint8_t OutputBaseAddress***
- ***uint8_t OutputBufferSize***
- ***uint32_t OutputThreshold***
- ***int16_t * pCoeffA***
- ***uint8_t CoeffASize***
- ***int16_t * pCoeffB***
- ***uint8_t CoeffBSize***
- ***uint8_t InputAccess***
- ***uint8_t OutputAccess***
- ***uint32_t Clip***
- ***uint32_t Filter***
- ***uint8_t P***
- ***uint8_t Q***
- ***uint8_t R***

Field Documentation

- ***uint8_t FMAC_FilterConfigTypeDef::InputBaseAddress***
  Base address of the input buffer (X1) within the internal memory (0x00 to 0xFF). Ignored if InputBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::InputBufferSize***
  Number of 16-bit words allocated to the input buffer (including the optional "headroom"). 0 if a previous configuration should be kept.
- ***uint32_t FMAC_FilterConfigTypeDef::InputThreshold***
  Input threshold: the buffer full flag will be set if the number of free spaces in the buffer is lower than this threshold. This parameter can be a value of ***FMAC_Data_Buffer_Threshold***.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBaseAddress***
  Base address of the coefficient buffer (X2) within the internal memory (0x00 to 0xFF). Ignored if CoeffBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBufferSize***
  Number of 16-bit words allocated to the coefficient buffer. 0 if a previous configuration should be kept.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputBaseAddress***
  Base address of the output buffer (Y) within the internal memory (0x00 to 0xFF). Ignored if OuputBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputBufferSize***
  Number of 16-bit words allocated to the output buffer (including the optional "headroom"). 0 if a previous configuration should be kept.
- ***uint32_t FMAC_FilterConfigTypeDef::OutputThreshold***
  Output threshold: the buffer empty flag will be set if the number of unread values in the buffer is lower than this threshold. This parameter can be a value of ***FMAC_Data_Buffer_Threshold***.
- ***int16_t* FMAC_FilterConfigTypeDef::pCoeffA***
  [IIR only] Initialization of the coefficient vector A. If not needed, it should be set to NULL.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffASize***
  Size of the coefficient vector A.
- ***int16_t* FMAC_FilterConfigTypeDef::pCoeffB***
  Initialization of the coefficient vector B. If not needed (re-use of a previously loaded buffer), it should be set to NULL.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBSize***
  Size of the coefficient vector B.
- ***uint8_t FMAC_FilterConfigTypeDef::InputAccess***
  Access to the input buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.

- ***uint8_t FMAC_FilterConfigTypeDef::OutputAccess***
  Access to the output buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint32_t FMAC_FilterConfigTypeDef::Clip***
  Enable or disable the clipping feature. If the q1.15 range is exceeded, wrapping is done when the clipping feature is disabled and saturation is done when the clipping feature is enabled. This parameter can be a value of ***FMAC_Clip_State***.
- ***uint32_t FMAC_FilterConfigTypeDef::Filter***
  Filter type. This parameter can be a value of ***FMAC_Functions*** (filter related values).
- ***uint8_t FMAC_FilterConfigTypeDef::P***
  Parameter P (vector length, number of filter taps, etc.).
- ***uint8_t FMAC_FilterConfigTypeDef::Q***
  Parameter Q (vector length, etc.). Ignored if not needed.
- ***uint8_t FMAC_FilterConfigTypeDef::R***
  Parameter R (gain, etc.). Ignored if not needed.

30.2 FMAC Firmware driver API description

The following section lists the various functions of the FMAC library.

30.2.1 How to use this driver

The FMAC HAL driver can be used as follows:

1. Initialize the FMAC low level resources by implementing the HAL_FMAC_MspInit():
   - Enable the FMAC interface clock using __HAL_RCC_FMAC_CLK_ENABLE().
   - In case of using interrupts (e.g. access configured as FMAC_BUFFER_ACCESS_IT):
     - Configure the FMAC interrupt priority using HAL_NVIC_SetPriority().
     - Enable the FMAC IRQ handler using HAL_NVIC_EnableIRQ().
     - In FMAC IRQ handler, call HAL_FMAC_IRQHandler().
   - In case of using DMA to control data transfer (e.g. access configured as FMAC_BUFFER_ACCESS_DMA):
     - Enable the DMA interface clock using __HAL_RCC_DMA1_CLK_ENABLE() or __HAL_RCC_DMA2_CLK_ENABLE() depending on the used DMA instance.
     - Enable the DMAMUX1 interface clock using __HAL_RCC_DMAMUX1_CLK_ENABLE().
     - If the initialization of the internal buffers (coefficients, input, output) is done via DMA, configure and enable one DMA channel for managing data transfer from memory to memory (preload channel).
     - If the input buffer is accessed via DMA, configure and enable one DMA channel for managing data transfer from memory to peripheral (input channel).
     - If the output buffer is accessed via DMA, configure and enable one DMA channel for managing data transfer from peripheral to memory (output channel).
     - Associate the initialized DMA handle(s) to the FMAC DMA handle(s) using __HAL_LINKDMA().
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the enabled DMA channel(s) using HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
2. Initialize the FMAC HAL using HAL_FMAC_Init(). This function resorts to HAL_FMAC_MspInit() for low-level initialization.

3. Configure the FMAC processing (filter) using HAL_FMAC_FilterConfig() or HAL_FMAC_FilterConfig_DMA(). This function:
   - Defines the memory area within the FMAC internal memory (input, coefficients, output) and the associated threshold (input, output).
   - Configures the filter and its parameters:
     - Finite Impulse Response (FIR) filter (also known as convolution).
     - Infinite Impulse Response (IIR) filter (direct form 1).
   - Choose the way to access to the input and output buffers: none, polling, DMA, IT. "none" means the input and/or output data will be handled by another IP (ADC, DAC, etc.).
   - Enable the error interruptions in the input access and/or the output access is done through IT/DMA. If an error occurs, the interruption will be triggered in loop. In order to recover, the user will have to reset the IP with the sequence HAL_FMAC_DeInit / HAL_FMAC_Init. Optionally, he can also disable the interrupt using __HAL_FMAC_DISABLE_IT; the error status will be kept, but no more interrupt will be triggered.
   - Write the provided coefficients into the internal memory using polling mode (HAL_FMAC_FilterConfig()) or DMA (HAL_FMAC_FilterConfig_DMA()). In the DMA case, HAL_FMAC_FilterConfigCallback() is called when the handling is over.
4. Optionally, the user can enable the error interruption related to saturation by calling __HAL_FMAC_ENABLE_IT. This helps in debugging the filter. If a saturation occurs, the interruption will be triggered in loop. In order to recover, the user will have to:
   - Disable the interruption by calling __HAL_FMAC_DISABLE_IT if the user wishes to continue all the same.
   - Reset the IP with the sequence HAL_FMAC_DeInit / HAL_FMAC_Init.
5. Optionally, preload input (FIR, IIR) and output (IIR) data using HAL_FMAC_FilterPreload() or HAL_FMAC_FilterPreload_DMA(). In the DMA case, HAL_FMAC_FilterPreloadCallback() is called when the handling is over. This step is optional as the filter can be started without preloaded data.
6. Start the FMAC processing (filter) using HAL_FMAC_FilterStart(). This function also configures the output buffer that will be filled from the circular internal output buffer. The function returns immediately without updating the provided buffer. The IP processing will be active until HAL_FMAC_FilterStop() is called.
7. If the input internal buffer is accessed via DMA, HAL_FMAC_HalfGetDataCallback() will be called to indicate that half of the input buffer has been handled.
8. If the input internal buffer is accessed via DMA or interrupt, HAL_FMAC_GetDataCallback() will be called to require new input data. It will be provided through HAL_FMAC_AppendFilterData() if the DMA isn't in circular mode.
9. If the output internal buffer is accessed via DMA, HAL_FMAC_HalfOutputDataReadyCallback() will be called to indicate that half of the output buffer has been handled.
10. If the output internal buffer is accessed via DMA or interrupt, HAL_FMAC_OutputDataReadyCallback() will be called to require a new output buffer. It will be provided through HAL_FMAC_ConfigFilterOutputBuffer() if the DMA isn't in circular mode.
11. In all modes except none, provide new input data to be processed via HAL_FMAC_AppendFilterData(). This function should only be called once the previous input data has been handled (the preloaded input data isn't concerned).
12. In all modes except none, provide a new output buffer to be filled via HAL_FMAC_ConfigFilterOutputBuffer(). This function should only be called once the previous user's output buffer has been filled.
13. In polling mode, handle the input and output data using HAL_FMAC_PollFilterData(). This function:
   - Write the user's input data (provided via HAL_FMAC_AppendFilterData()) into the FMAC input memory area.
   - Read the FMAC output memory area and write it into the user's output buffer. It will return either when:
   - the user's output buffer is filled.
   - the user's input buffer has been handled. The unused data (unread input data or free output data) will not be saved. The user will have to use the updated input and output sizes to keep track of them.
14. Stop the FMAC processing (filter) using HAL_FMAC_FilterStop().
15. Call HAL_FMAC_DeInit() to de-initialize the FMAC peripheral. This function resorts to HAL_FMAC_MspDeInit() for low-level de-initialization.

30.2.2 Callback registration

The compilation define USE_HAL_FMAC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_FMAC_RegisterCallback() to register a user callback. Function HAL_FMAC_RegisterCallback() allows to register following callbacks:

- ErrorCallback : Error Callback.
- HalfGetDataCallback : Get Half Data Callback.
- GetDataCallback : Get Data Callback.
- HalfOutputDataReadyCallback : Half Output Data Ready Callback.
- OutputDataReadyCallback : Output Data Ready Callback.
- FilterConfigCallback : Filter Configuration Callback.
- FilterPreloadCallback : Filter Preload Callback.
- MspInitCallback : FMAC MspInit.
- MspDeInitCallback : FMAC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_FMAC_UnRegisterCallback() to reset a callback to the default weak function. HAL_FMAC_UnRegisterCallback() takes as parameters the HAL peripheral handle and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : Error Callback.
- HalfGetDataCallback : Get Half Data Callback.
- GetDataCallback : Get Data Callback.
- HalfOutputDataReadyCallback : Half Output Data Ready Callback.
- OutputDataReadyCallback : Output Data Ready Callback.
- FilterConfigCallback : Filter Configuration Callback.
- FilterPreloadCallback : Filter Preload Callback.
- MspInitCallback : FMAC MspInit.
- MspDeInitCallback : FMAC MspDeInit.

By default, after the HAL_FMAC_Init() and when the state is HAL_FMAC_STATE_RESET all callbacks are set to the corresponding weak functions: examples GetDataCallback(), OutputDataReadyCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak functions in the HAL_FMAC_Init() and HAL_FMAC_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_FMAC_Init() and HAL_FMAC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_FMAC_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_FMAC_STATE_READY or HAL_FMAC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_FMAC_RegisterCallback() before calling HAL_FMAC_DeInit() or HAL_FMAC_Init() function.

When the compilation define USE_HAL_FMAC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak callbacks are used.

30.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the FMAC peripheral and the associated handle
- DeInitialize the FMAC peripheral
- Initialize the FMAC MSP (MCU Specific Package)
- De-Initialize the FMAC MSP
- Register a User FMAC Callback
- Unregister a FMAC CallBack

This section contains the following APIs:

- ***HAL_FMAC_Init()***
- ***HAL_FMAC_DeInit()***

- *HAL_FMAC_MspInit()*
- *HAL_FMAC_MspDeInit()*
- *HAL_FMAC_RegisterCallback()*
- *HAL_FMAC_UnRegisterCallback()*

30.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the FMAC peripheral: memory area, filter type and parameters, way to access to the input and output memory area (none, polling, IT, DMA).
- Start the FMAC processing (filter).
- Handle the input data that will be provided into FMAC.
- Handle the output data provided by FMAC.
- Stop the FMAC processing (filter).

This section contains the following APIs:

- *HAL_FMAC_FilterConfig()*
- *HAL_FMAC_FilterConfig_DMA()*
- *HAL_FMAC_FilterPreload()*
- *HAL_FMAC_FilterPreload_DMA()*
- *HAL_FMAC_FilterStart()*
- *HAL_FMAC_AppendFilterData()*
- *HAL_FMAC_ConfigFilterOutputBuffer()*
- *HAL_FMAC_PollFilterData()*
- *HAL_FMAC_FilterStop()*

30.2.5 Callback functions

This section provides Interruption and DMA callback functions:

- DMA or Interrupt: the user's input data is half written (DMA only) or completely written.
- DMA or Interrupt: the user's output buffer is half filled (DMA only) or completely filled.
- DMA or Interrupt: error handling.

This section contains the following APIs:

- *HAL_FMAC_ErrorCallback()*
- *HAL_FMAC_HalfGetDataCallback()*
- *HAL_FMAC_GetDataCallback()*
- *HAL_FMAC_HalfOutputDataReadyCallback()*
- *HAL_FMAC_OutputDataReadyCallback()*
- *HAL_FMAC_FilterConfigCallback()*
- *HAL_FMAC_FilterPreloadCallback()*

30.2.6 IRQ handler management

This section provides IRQ handler function.

This section contains the following APIs:

- *HAL_FMAC_IRQHandler()*

30.2.7 Peripheral State and Error functions

This subsection provides functions allowing to

- Check the FMAC state
- Get error code

This section contains the following APIs:

- *HAL_FMAC_GetState()*

- *HAL_FMAC_GetError()*

30.2.8 Detailed description of functions

HAL_FMAC_Init

Function name

HAL_StatusTypeDef HAL_FMAC_Init (FMAC_HandleTypeDef * hfmac)

Function description

Initialize the FMAC peripheral and the associated handle.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_DeInit

Function name

HAL_StatusTypeDef HAL_FMAC_DeInit (FMAC_HandleTypeDef * hfmac)

Function description

De-initialize the FMAC peripheral.

Parameters

- **hfmac:** pointer to a FMAC structure.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_MspInit

Function name

void HAL_FMAC_MspInit (FMAC_HandleTypeDef * hfmac)

Function description

Initialize the FMAC MSP.

Parameters

- **hfmac:** FMAC handle.

Return values

- **None:**

HAL_FMAC_MspDeInit

Function name

void HAL_FMAC_MspDeInit (FMAC_HandleTypeDef * hfmac)

Function description

De-initialize the FMAC MSP.

Parameters

- **hfmac:** FMAC handle.

Return values

- **None:**

HAL_FMAC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FMAC_RegisterCallback (FMAC_HandleTypeDef * hfmac, HAL_FMAC_CallbackIDTypeDef CallbackID, pFMAC_CallbackTypeDef pCallback)

Function description

Register a User FMAC Callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_FMAC_ERROR_CB_ID Error Callback ID
  - HAL_FMAC_HALF_GET_DATA_CB_ID Get Half Data Callback ID
  - HAL_FMAC_GET_DATA_CB_ID Get Data Callback ID
  - HAL_FMAC_HALF_OUTPUT_DATA_READY_CB_ID Half Output Data Ready Callback ID
  - HAL_FMAC_OUTPUT_DATA_READY_CB_ID Output Data Ready Callback ID
  - HAL_FMAC_FILTER_CONFIG_CB_ID Filter Configuration Callback ID
  - HAL_FMAC_FILTER_PRELOAD_CB_ID Filter Preload Callback ID
  - HAL_FMAC_MSPINIT_CB_ID FMAC MspInit ID
  - HAL_FMAC_MSPDEINIT_CB_ID FMAC MspDeInit ID
- **pCallback:** pointer to the Callback function.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The User FMAC Callback is to be used instead of the weak predefined callback.
- The HAL_FMAC_RegisterCallback() may be called before HAL_FMAC_Init() in HAL_FMAC_STATE_RESET to register callbacks for HAL_FMAC_MSPINIT_CB_ID and HAL_FMAC_MSPDEINIT_CB_ID.

HAL_FMAC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FMAC_UnRegisterCallback (FMAC_HandleTypeDef * hfmac, HAL_FMAC_CallbackIDTypeDef CallbackID)

Function description

Unregister a FMAC CallBack.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_FMAC_ERROR_CB_ID Error Callback ID
  - HAL_FMAC_HALF_GET_DATA_CB_ID Get Half Data Callback ID
  - HAL_FMAC_GET_DATA_CB_ID Get Data Callback ID
  - HAL_FMAC_HALF_OUTPUT_DATA_READY_CB_ID Half Output Data Ready Callback ID
  - HAL_FMAC_OUTPUT_DATA_READY_CB_ID Output Data Ready Callback ID
  - HAL_FMAC_FILTER_CONFIG_CB_ID Filter Configuration Callback ID
  - HAL_FMAC_FILTER_PRELOAD_CB_ID Filter Preload Callback ID
  - HAL_FMAC_MSPINIT_CB_ID FMAC MspInit ID
  - HAL_FMAC_MSPDEINIT_CB_ID FMAC MspDeInit ID

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The FMAC callback is redirected to the weak predefined callback.
- The HAL_FMAC_UnRegisterCallback() may be called before HAL_FMAC_Init() in HAL_FMAC_STATE_RESET to register callbacks for HAL_FMAC_MSPINIT_CB_ID and HAL_FMAC_MSPDEINIT_CB_ID.

HAL_FMAC_FilterConfig

Function name

HAL_StatusTypeDef HAL_FMAC_FilterConfig (FMAC_HandleTypeDef * hfmac, FMAC_FilterConfigTypeDef * pConfig)

Function description

Configure the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pConfig:** pointer to a FMAC_FilterConfigTypeDef structure that contains the FMAC configuration information.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The configuration is done according to the parameters specified in the FMAC_FilterConfigTypeDef structure. The provided data will be loaded using polling mode.

HAL_FMAC_FilterConfig_DMA

Function name

HAL_StatusTypeDef HAL_FMAC_FilterConfig_DMA (FMAC_HandleTypeDef * hfmac, FMAC_FilterConfigTypeDef * pConfig)

Function description

Configure the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pConfig:** pointer to a FMAC_FilterConfigTypeDef structure that contains the FMAC configuration information.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The configuration is done according to the parameters specified in the FMAC_FilterConfigTypeDef structure. The provided data will be loaded using DMA.

HAL_FMAC_FilterPreload

Function name

HAL_StatusTypeDef HAL_FMAC_FilterPreload (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint8_t InputSize, int16_t * pOutput, uint8_t OutputSize)

Function description

Preload the input (FIR, IIR) and output data (IIR) of the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** Preloading of the first elements of the input buffer (X1). If not needed (no data available when starting), it should be set to NULL.
- **InputSize:** Size of the input vector. As pInput is used for preloading data, it cannot be bigger than the input memory area.
- **pOutput:** [IIR] Preloading of the first elements of the output vector (Y). If not needed, it should be set to NULL.
- **OutputSize:** Size of the output vector. As pOutput is used for preloading data, it cannot be bigger than the output memory area.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The set(s) of data will be used by FMAC as soon as HAL_FMAC_FilterStart is called. The provided data will be loaded using polling mode.
- The input and the output buffers can be filled by calling several times HAL_FMAC_FilterPreload (each call filling partly the buffers). In case of overflow (too much data provided through all these calls), an error will be returned.

HAL_FMAC_FilterPreload_DMA

Function name

HAL_StatusTypeDef HAL_FMAC_FilterPreload_DMA (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint8_t InputSize, int16_t * pOutput, uint8_t OutputSize)

Function description

Preload the input (FIR, IIR) and output data (IIR) of the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** Preloading of the first elements of the input buffer (X1). If not needed (no data available when starting), it should be set to NULL.
- **InputSize:** Size of the input vector. As pInput is used for preloading data, it cannot be bigger than the input memory area.
- **pOutput:** [IIR] Preloading of the first elements of the output vector (Y). If not needed, it should be set to NULL.
- **OutputSize:** Size of the output vector. As pOutput is used for preloading data, it cannot be bigger than the output memory area.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The set(s) of data will be used by FMAC as soon as HAL_FMAC_FilterStart is called. The provided data will be loaded using DMA.
- The input and the output buffers can be filled by calling several times HAL_FMAC_FilterPreload (each call filling partly the buffers). In case of overflow (too much data provided through all these calls), an error will be returned.

HAL_FMAC_FilterStart

Function name

HAL_StatusTypeDef HAL_FMAC_FilterStart (FMAC_HandleTypeDef * hfmac, int16_t * pOutput, uint16_t * pOutputSize)

Function description

Start the FMAC processing according to the existing FMAC configuration.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pOutput:** pointer to buffer where output data of FMAC processing will be stored in the next steps. If it is set to NULL, the output will not be read and it will be up to an external IP to empty the output buffer.
- **pOutputSize:** pointer to the size of the output buffer. The number of read data will be written here.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_AppendFilterData

Function name

HAL_StatusTypeDef HAL_FMAC_AppendFilterData (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint16_t * pInputSize)

Function description

Provide a new input buffer that will be loaded into the FMAC input memory area.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** New input vector (additional input data).
- **pInputSize:** Size of the input vector (if all the data can't be written, it will be updated with the number of data read from FMAC).

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_ConfigFilterOutputBuffer

Function name

HAL_StatusTypeDef HAL_FMAC_ConfigFilterOutputBuffer (FMAC_HandleTypeDef * hfmac, int16_t * pOutput, uint16_t * pOutputSize)

Function description

Provide a new output buffer to be filled with the data computed by FMAC unit.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pOutput:** New output vector.
- **pOutputSize:** Size of the output vector (if the vector can't be entirely filled, pOutputSize will be updated with the number of data read from FMAC).

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_PollFilterData

Function name

HAL_StatusTypeDef HAL_FMAC_PollFilterData (FMAC_HandleTypeDef * hfmac, uint32_t Timeout)

Function description

Handle the input and/or output data in polling mode.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **Timeout:** timeout value.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- This function writes the previously provided user's input data and fills the previously provided user's output buffer, according to the existing FMAC configuration (polling mode only). The function returns when the input data has been handled or when the output data is filled. The possible unused data isn't kept. It will be up to the user to handle it. The previously provided pInputSize and pOutputSize will be used to indicate to the size of the read/written data to the user.

HAL_FMAC_FilterStop

Function name

HAL_StatusTypeDef HAL_FMAC_FilterStop (FMAC_HandleTypeDef * hfmac)

Function description

Stop the FMAC processing.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_ErrorCallback

Function name

void HAL_FMAC_ErrorCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC error callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_HalfGetDataCallback

Function name

void HAL_FMAC_HalfGetDataCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC get half data callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_GetDataCallback

Function name

void HAL_FMAC_GetDataCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC get data callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_HalfOutputDataReadyCallback

Function name

void HAL_FMAC_HalfOutputDataReadyCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC half output data ready callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_OutputDataReadyCallback

Function name

void HAL_FMAC_OutputDataReadyCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC output data ready callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_FilterConfigCallback

Function name

void HAL_FMAC_FilterConfigCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC filter configuration callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_FilterPreloadCallback

Function name

void HAL_FMAC_FilterPreloadCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC filter preload callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_IRQHandler

Function name

void HAL_FMAC_IRQHandler (FMAC_HandleTypeDef * hfmac)

Function description

Handle FMAC interrupt request.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_GetState

Function name

HAL_FMAC_StateTypeDef HAL_FMAC_GetState (const FMAC_HandleTypeDef * hfmac)

Function description

Return the FMAC state.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **HAL_FMAC_StateTypeDef:** FMAC state

HAL_FMAC_GetError

Function name

uint32_t HAL_FMAC_GetError (const FMAC_HandleTypeDef * hfmac)

Function description

Return the FMAC peripheral error.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **uint32_t:** Error bit-map based on FMAC Error code

Notes

- The returned error is a bit-map combination of possible errors.

30.3 FMAC Firmware driver defines

The following section lists the various define and macros of the module.

30.3.1 FMAC

FMAC

FMAC Buffer Access

FMAC_BUFFER_ACCESS_NONE

Buffer handled by an external IP (ADC for instance)

FMAC_BUFFER_ACCESS_DMA

Buffer accessed through DMA

FMAC_BUFFER_ACCESS_POLLING

Buffer accessed through polling

FMAC_BUFFER_ACCESS_IT

Buffer accessed through interruptions

FMAC Clip State

FMAC_CLIP_DISABLED

Clipping disabled

FMAC_CLIP_ENABLED

Clipping enabled

FMAC Data Buffer Threshold

FMAC_THRESHOLD_1

Input: Buffer full flag set if the number of free spaces in the buffer is less than 1. Output: Buffer empty flag set if the number of unread values in the buffer is less than 1.

FMAC_THRESHOLD_2

Input: Buffer full flag set if the number of free spaces in the buffer is less than 2. Output: Buffer empty flag set if the number of unread values in the buffer is less than 2.

FMAC_THRESHOLD_4

Input: Buffer full flag set if the number of free spaces in the buffer is less than 4. Output: Buffer empty flag set if the number of unread values in the buffer is less than 4.

FMAC_THRESHOLD_8

Input: Buffer full flag set if the number of free spaces in the buffer is less than 8. Output: Buffer empty flag set if the number of unread values in the buffer is less than 8.

FMAC_THRESHOLD_NO_VALUE

The configured threshold value shouldn't be changed

FMAC Error code

HAL_FMAC_ERROR_NONE

No error

HAL_FMAC_ERROR_SAT

Saturation error

HAL_FMAC_ERROR_UNFL

Underflow error

HAL_FMAC_ERROR_OVFL

Overflow error

HAL_FMAC_ERROR_DMA

DMA error

HAL_FMAC_ERROR_RESET

Reset error

HAL_FMAC_ERROR_PARAM

Parameter error

HAL_FMAC_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_FMAC_ERROR_TIMEOUT

Timeout error

FMAC Exported Macros

__HAL_FMAC_RESET_HANDLE_STATE

Description:

- Reset FMAC handle state.

Parameters:

- __HANDLE__: FMAC handle.

Return value:

- None

__HAL_FMAC_ENABLE_IT

Description:

- Enable the specified FMAC interrupt.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC Interrupt. This parameter can be any combination of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- None

__HAL_FMAC_DISABLE_IT

Description:

- Disable the FMAC interrupt.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC Interrupt. This parameter can be any combination of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- None

__HAL_FMAC_GET_IT

Description:

- Check whether the specified FMAC interrupt occurred or not.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to check. This parameter can be any combination of the following values:
  - FMAC_FLAG_YEMPTY Y Buffer Empty Flag
  - FMAC_FLAG_X1FULL X1 Buffer Full Flag
  - FMAC_FLAG_OVFL Overflow Error Flag
  - FMAC_FLAG_UNFL Underflow Error Flag
  - FMAC_FLAG_SAT Saturation Error Flag

Return value:

- SET: (interrupt occurred) or RESET (interrupt did not occurred)

__HAL_FMAC_CLEAR_IT

Description:

- Clear specified FMAC interrupt status.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to clear.

Return value:

- None

__HAL_FMAC_GET_FLAG

Description:

- Check whether the specified FMAC status flag is set or not.

Parameters:

- __HANDLE__: FMAC handle.
- __FLAG__: FMAC flag to check. This parameter can be any combination of the following values:
  - FMAC_FLAG_YEMPTY Y Buffer Empty Flag
  - FMAC_FLAG_X1FULL X1 Buffer Full Flag
  - FMAC_FLAG_OVFL Overflow Error Flag
  - FMAC_FLAG_UNFL Underflow Error Flag
  - FMAC_FLAG_SAT Saturation error Flag

Return value:

- SET: (flag is set) or RESET (flag is reset)

__HAL_FMAC_CLEAR_FLAG

Description:

- Clear specified FMAC status flag.

Parameters:

- __HANDLE__: FMAC handle.
- __FLAG__: FMAC flag to clear.

Return value:

- None

__HAL_FMAC_GET_IT_SOURCE

Description:

- Check whether the specified FMAC interrupt is enabled or not.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to check. This parameter can be one of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- FlagStatus

FMAC status flags

FMAC_FLAG_YEMPTY

Y Buffer Empty Flag

FMAC_FLAG_X1FULL

X1 Buffer Full Flag

FMAC_FLAG_OVFL

Overflow Error Flag

FMAC_FLAG_UNFL

Underflow Error Flag

FMAC_FLAG_SAT

Saturation Error Flag (this helps in debugging a filter)

FMAC Functions

FMAC_FUNC_LOAD_X1

Load X1 buffer

FMAC_FUNC_LOAD_X2

Load X2 buffer

FMAC_FUNC_LOAD_Y

Load Y buffer

FMAC_FUNC_CONVO_FIR

Convolution (FIR filter)

FMAC_FUNC_IIR_DIRECT_FORM_1

IIR filter (direct form 1)

FMAC Interrupts Enable bit

FMAC_IT_RIEN

Read Interrupt Enable

FMAC_IT_WIEN

Write Interrupt Enable

FMAC_IT_OVFLIEN

Overflow Error Interrupt Enable

FMAC_IT_UNFLIEN

Underflow Error Interrupt Enable

FMAC_IT_SATIEN

Saturation Error Interrupt Enable (this helps in debugging a filter)

31 HAL GPIO Generic Driver

31.1 GPIO Firmware driver registers structures

31.1.1 GPIO_InitTypeDef

GPIO_InitTypeDef is defined in the stm32h5xx_hal_gpio.h

Data Fields

- ***uint32_t Pin***
- ***uint32_t Mode***
- ***uint32_t Pull***
- ***uint32_t Speed***
- ***uint32_t Alternate***

Field Documentation

- ***uint32_t GPIO_InitTypeDef::Pin***
  Specifies the GPIO pins to be configured. This parameter can be a value of ***GPIO_pins***
- ***uint32_t GPIO_InitTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***GPIO_mode***
- ***uint32_t GPIO_InitTypeDef::Pull***
  Specifies the Pull-up or Pull-Down activation for the selected pins. This parameter can be a value of ***GPIO_pull***
- ***uint32_t GPIO_InitTypeDef::Speed***
  Specifies the speed for the selected pins. This parameter can be a value of ***GPIO_speed***
- ***uint32_t GPIO_InitTypeDef::Alternate***
  Peripheral to be connected to the selected pins This parameter can be a value of ***GPIOEx_Alternate_function_selection***

31.2 GPIO Firmware driver API description

The following section lists the various functions of the GPIO library.

31.2.1 GPIO Peripheral features

- Each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:
  - Input mode
  - Analog mode
  - Output mode
  - Alternate function mode
  - External interrupt/event lines
- During and just after reset, the alternate functions and external interrupt lines are not active and the I/O ports are configured in input floating mode.
- All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not.
- In Output or Alternate mode, each IO can be configured on open-drain or push-pull type and the IO speed can be selected depending on the VDD value.
- The microcontroller IO pins are connected to onboard peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an IO pin at a time. In this way, there can be no conflict between peripherals sharing the same IO pin.
- All ports have external interrupt/event capability. To use external interrupt lines, the port must be configured in input mode. All available GPIO pins are connected to the 16 external interrupt/event lines from EXTI0 to EXTI15.

- The external interrupt/event controller consists of up to 39 edge detectors (16 lines are connected to GPIO) for generating event/interrupt requests (each input line can be independently configured to select the type (interrupt or event) and the corresponding trigger event (rising or falling or both). Each line can also be masked independently.

31.2.2 How to use this driver

1. Enable the GPIO AHB clock using the following function: __HAL_RCC_GPIOx_CLK_ENABLE().
2. Configure the GPIO pin(s) using HAL_GPIO_Init().
   - Configure the IO mode using "Mode" member from GPIO_InitTypeDef structure
   - Activate Pull-up, Pull-down resistor using "Pull" member from GPIO_InitTypeDef structure.
   - In case of Output or alternate function mode selection: the speed is configured through "Speed" member from GPIO_InitTypeDef structure.
   - In alternate mode is selection, the alternate function connected to the IO is configured through "Alternate" member from GPIO_InitTypeDef structure.
   - Analog mode is required when a pin is to be used as ADC channel or DAC output.
   - In case of external interrupt/event selection the "Mode" member from GPIO_InitTypeDef structure select the type (interrupt or event) and the corresponding trigger event (rising or falling or both).
3. In case of external interrupt/event mode selection, configure NVIC IRQ priority mapped to the EXTI line using HAL_NVIC_SetPriority() and enable it using HAL_NVIC_EnableIRQ().
4. To get the level of a pin configured in input mode use HAL_GPIO_ReadPin().
5. To set/reset the level of a pin configured in output mode use HAL_GPIO_WritePin()/HAL_GPIO_TogglePin().
6. To set the level of several pins and reset level of several other pins in same cycle, use HAL_GPIO_WriteMultipleStatePin().
7. To lock pin configuration until next reset use HAL_GPIO_LockPin().
8. During and just after reset, the alternate functions are not active and the GPIO pins are configured in input floating mode (except JTAG pins).
9. The LSE oscillator pins OSC32_IN and OSC32_OUT can be used as general purpose (PC14 and PC15, respectively) when the LSE oscillator is off. The LSE has priority over the GPIO function.
10. The HSE oscillator pins OSC_IN/OSC_OUT can be used as general purpose PH0 and PH1, respectively, when the HSE oscillator is off. The HSE has priority over the GPIO function.

31.2.3 Initialization and de-initialization functions

This section contains the following APIs:

- ***HAL_GPIO_Init()***
- ***HAL_GPIO_DeInit()***

31.2.4 IO attributes functions

This section contains the following APIs:

- ***HAL_GPIO_ConfigPinAttributes()***
- ***HAL_GPIO_GetConfigPinAttributes()***

31.2.5 Detailed description of functions

HAL_GPIO_Init

Function name

void HAL_GPIO_Init (GPIO_TypeDef * GPIOx, const GPIO_InitTypeDef * pGPIO_Init)

Function description

Initialize the GPIOx peripheral according to the specified parameters in the pGPIO_Init.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **pGPIO_Init:** pointer to a GPIO_InitTypeDef structure that contains the configuration information for the specified GPIO peripheral.

Return values

- **None:**

Notes

- If GPIOx peripheral pin is used in EXTI_MODE and the pin is secure in case the system implements the security (TZEN=1), it is up to the secure application to insure that the corresponding EXTI line is set secure.

HAL_GPIO_DeInit

Function name

void HAL_GPIO_DeInit (GPIO_TypeDef * GPIOx, uint32_t GPIO_Pin)

Function description

De-initialize the GPIOx peripheral registers to their default reset values.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be one of GPIO_PIN_x where x can be (0..15).

Return values

- **None:**

HAL_GPIO_ReadPin

Function name

GPIO_PinState HAL_GPIO_ReadPin (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Read the specified input port pin.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the port bit to read. This parameter can be GPIO_PIN_x where x can be (0..15).

Return values

- **The:** input port pin value.

HAL_GPIO_WritePin

Function name

void HAL_GPIO_WritePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, GPIO_PinState PinState)

Function description

Set or clear the selected data port bit.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be one of GPIO_PIN_x where x can be (0..15).
- **PinState:** specifies the value to be written to the selected bit. This parameter can be one of the GPIO_PinState enum values:
  - GPIO_PIN_RESET: to clear the port pin
  - GPIO_PIN_SET: to set the port pin

Return values

- **None:**

Notes

- This function uses GPIOx_BSRR and GPIOx_BRR registers to allow atomic read/modify accesses. In this way, there is no risk of an IRQ occurring between the read and the modify access.

HAL_GPIO_WriteMultipleStatePin

Function name

void HAL_GPIO_WriteMultipleStatePin (GPIO_TypeDef * GPIOx, uint16_t PinReset, uint16_t PinSet)

Function description

Set and clear several pins of a dedicated port in same cycle.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **PinReset:** specifies the port bits to be reset This parameter can be any combination of GPIO_Pin_x where x can be (0..15) or zero.
- **PinSet:** specifies the port bits to be set This parameter can be any combination of GPIO_Pin_x where x can be (0..15) or zero.

Return values

- **None:**

Notes

- This function uses GPIOx_BSRR and GPIOx_BRR registers to allow atomic read/modify accesses.
- Both PinReset and PinSet combinations shall not get any common bit, else assert would be triggered.
- At least one of the two parameters used to set or reset shall be different from zero.

HAL_GPIO_TogglePin

Function name

void HAL_GPIO_TogglePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Toggle the specified GPIO pin.

Parameters

- **GPIOx:** where x can be (A..I) to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the pin to be toggled.

Return values

- **None:**

HAL_GPIO_EnableHighSPeedLowVoltage

Function name

void HAL_GPIO_EnableHighSPeedLowVoltage (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Enable speed optimization for several pin of dedicated port.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- Not all I/Os support the HSLV mode. Refer to the I/O structure in the corresponding datasheet for the list of I/Os supporting this feature. Other I/Os HSLV configuration must be kept at reset value.
- It must be used only if the I/O supply voltage is below 2.7 V.

HAL_GPIO_DisableHighSPeedLowVoltage

Function name

void HAL_GPIO_DisableHighSPeedLowVoltage (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Disable speed optimization for several pin of dedicated port.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- Not all I/Os support the HSLV mode. Refer to the I/O structure in the corresponding datasheet for the list of I/Os supporting this feature. Other I/Os HSLV configuration must be kept at reset value.
- It must be used only if the I/O supply voltage is below 2.7 V.

HAL_GPIO_LockPin

Function name

HAL_StatusTypeDef HAL_GPIO_LockPin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Lock GPIO Pins configuration registers.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the port bits to be locked. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- The locked registers are GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_AFRL and GPIOx_AFRH.
- The configuration of the locked GPIO pins can no longer be modified until the next reset.

HAL_GPIO_EXTI_IRQHandler

Function name

void HAL_GPIO_EXTI_IRQHandler (uint16_t GPIO_Pin)

Function description

Handle EXTI interrupt request.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Rising_Callback

Function name

void HAL_GPIO_EXTI_Rising_Callback (uint16_t GPIO_Pin)

Function description

EXTI line rising detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Falling_Callback

Function name

void HAL_GPIO_EXTI_Falling_Callback (uint16_t GPIO_Pin)

Function description

EXTI line falling detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_ConfigPinAttributes

Function name

void HAL_GPIO_ConfigPinAttributes (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, uint32_t PinAttributes)

Function description

Configure the GPIO pins attributes.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the pin(s) to configure the secure attribute
- **PinAttributes:** specifies the pin(s) to be set in secure mode, other being set non secured.

Return values

- **None:**

Notes

- Available attributes are to secure GPIO pin(s), so this function is only available in secure

HAL_GPIO_GetConfigPinAttributes

Function name

HAL_StatusTypeDef HAL_GPIO_GetConfigPinAttributes (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, uint32_t * pPinAttributes)

Function description

Get the GPIO pins attributes.

Parameters

- **GPIOx:** where x can be (A..I) for stm32h56xxx and stm32h57xxx family lines and (A..D or H) for stm32h503xx family line to select the GPIO peripheral for STM32H5 family
- **GPIO_Pin:** specifies the single pin to get the secure attribute from
- **pPinAttributes:** pointer to return the pin attributes.

Return values

- **HAL:** Status.

Notes

- Available attributes are to secure GPIO pin(s), so this function is only available in secure

31.3 GPIO Firmware driver defines

The following section lists the various define and macros of the module.

31.3.1 GPIO

GPIO

GPIO attributes

GPIO_PIN_SEC

Secure pin attribute

GPIO_PIN_NSEC

Non-secure pin attribute

GPIO Exported Macros

__HAL_GPIO_EXTI_GET_RISING_IT

Description:

- Check whether the specified EXTI line is rising edge asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_RISING_IT

Description:

- Clear the EXTI's line rising pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_FALLING_IT

Description:

- Check whether the specified EXTI line is falling edge asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FALLING_IT

Description:

- Clear the EXTI's line falling pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_IT

Description:

- Check whether the specified EXTI line is asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_IT

Description:

- Clear the EXTI's line pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GENERATE_SWIT

Description:

- Generate a Software interrupt on selected EXTI line(s).

Parameters:

- __EXTI_LINE__: specifies the EXTI line to set. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_FLAG

Description:

- Check whether the specified EXTI line flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line flag to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FLAG

Description:

- Clear the EXTI line pending flags.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines flags to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

33 HAL GTZC Generic Driver

33.1 GTZC Firmware driver registers structures

33.1.1 MPCBB_Attribute_ConfigTypeDef

MPCBB_Attribute_ConfigTypeDef is defined in the stm32h5xx_hal_gtzc.h

Data Fields

- ***uint32_t MPCBB_SecConfig_array***
- ***uint32_t MPCBB_PrivConfig_array***
- ***uint32_t MPCBB_LockConfig_array***

Field Documentation

- ***uint32_t MPCBB_Attribute_ConfigTypeDef::MPCBB_SecConfig_array[GTZC_MPCBB_NB_VCTR_REG_MAX]***
  Each element specifies secure access mode for a super-block. Each bit corresponds to a block inside the super-block. 0 means non-secure, 1 means secure
- ***uint32_t MPCBB_Attribute_ConfigTypeDef::MPCBB_PrivConfig_array[GTZC_MPCBB_NB_VCTR_REG_MAX]***
  Each element specifies privilege access mode for a super-block. Each bit corresponds to a block inside the super-block. 0 means non-privilege, 1 means privilege
- ***uint32_t MPCBB_Attribute_ConfigTypeDef::MPCBB_LockConfig_array[GTZC_MPCBB_NB_LCK_VCTR_REG_MAX]***
  Each bit specifies the lock configuration of a super-block (32 blocks). 0 means unlocked, 1 means locked

33.1.2 MPCBB_ConfigTypeDef

MPCBB_ConfigTypeDef is defined in the stm32h5xx_hal_gtzc.h

Data Fields

- ***uint32_t SecureRWIllegalMode***
- ***uint32_t InvertSecureState***
- ***MPCBB_Attribute_ConfigTypeDef AttributeConfig***

Field Documentation

- ***uint32_t MPCBB_ConfigTypeDef::SecureRWIllegalMode***
  Secure read/write illegal access field. It can be a value of ***GTZC_MPCBB_SecureRWIllegalMode***
- ***uint32_t MPCBB_ConfigTypeDef::InvertSecureState***
  Default security state field (can be inverted or not). It can be a value of ***GTZC_MPCBB_InvertSecureState***
- ***MPCBB_Attribute_ConfigTypeDef MPCBB_ConfigTypeDef::AttributeConfig***
  MPCBB attribute configuration sub-structure

33.1.3 MPCWM_ConfigTypeDef

MPCWM_ConfigTypeDef is defined in the stm32h5xx_hal_gtzc.h

Data Fields

- ***uint32_t AreaId***
- ***uint32_t Offset***
- ***uint32_t Length***
- ***uint32_t Attribute***
- ***uint32_t Lock***
- ***uint32_t AreaStatus***

Field Documentation

- ***uint32_t MPCWM_ConfigTypeDef::AreaId***
  Area identifier field. It can be a value of ***GTZC_MPCWM_AreaId***

- ***uint32_t MPCWM_ConfigTypeDef::Offset***
  Offset of the watermark area, starting from the selected memory base address. It must aligned on 128KB for FMC and OCTOSPI memories, and on 32-byte for BKPSRAM
- ***uint32_t MPCWM_ConfigTypeDef::Length***
  Length of the watermark area, starting from the selected Offset. It must aligned on 128KB for FMC and OCTOSPI memories, and on 32-byte for BKPSRAM
- ***uint32_t MPCWM_ConfigTypeDef::Attribute***
  Attributes of the watermark area. It can be a value of ***GTZC_MPCWM_Attribute***
- ***uint32_t MPCWM_ConfigTypeDef::Lock***
  Lock of the watermark area. It can be a value of ***GTZC_MPCWM_Lock***
- ***uint32_t MPCWM_ConfigTypeDef::AreaStatus***
  Status of the watermark area. It can be set to ENABLE or DISABLE

33.2 GTZC Firmware driver API description

The following section lists the various functions of the GTZC library.

33.2.1 GTZC main features

- Global TrustZone Controller (GTZC) composed of three sub-blocks:
  - TZSC: TrustZone security controller This sub-block defines the secure/privileged state of master and slave peripherals. It also controls the secure/privileged state of subregions for the watermark memory peripheral controller (MPCWM).
  - MPCBB: Block-Based memory protection controller This sub-block defines the secure/privileged state of all blocks (512-byte pages) of the associated SRAM.
  - TZIC: TrustZone illegal access controller This sub-block gathers all illegal access events in the system and generates a secure interrupt towards NVIC.
- These sub-blocks are used to configure TrustZone system security in a product having bus agents with programmable-security and privileged attributes (securable) such as:
  - on-chip RAM with programmable secure and/or privilege blocks (pages)
  - AHB and APB peripherals with programmable security and/or privilege access
  - AHB master granted as secure and/or privilege
  - off-chip memories with secure and/or privilege areas
- TZIC accessible only with secure privileged transactions.
- Secure and non-secure access supported for privileged and unprivileged part of TZSC and MPCBB
- Set of registers to define product security settings:
  - Secure and privilege blocks for internal memories
  - Secure and privilege regions for external memories
  - Secure and privileged access mode for securable peripherals
    ==========

33.2.2 How to use this driver

The GTZC HAL driver can be used as follows:

1. Configure or get back securable peripherals attributes using HAL_GTZC_TZSC_ConfigPeriphAttributes() / HAL_GTZC_TZSC_GetConfigPeriphAttributes()
2. Configure or get back MPCWM memories attributes using HAL_GTZC_TZSC_MPCWM_ConfigMemAttributes() / HAL_GTZC_TZSC_MPCWM_GetConfigMemAttributes()
3. Lock TZSC sub-block or get lock status using HAL_GTZC_TZSC_Lock() / HAL_GTZC_TZSC_GetLock()
4. Configure or get back MPCBB memories complete configuration using HAL_GTZC_MPCBB_ConfigMem() / HAL_GTZC_MPCBB_GetConfigMem()
5. Configure or get back MPCBB memories attributes using HAL_GTZC_MPCBB_ConfigMemAttributes() / HAL_GTZC_MPCBB_GetConfigMemAttributes()

6. Lock MPCBB configuration or get lock status using HAL_GTZC_MPCBB_Lock() / HAL_GTZC_MPCBB_GetLock()
7. Lock MPCBB super-blocks or get lock status using HAL_GTZC_MPCBB_LockConfig() / HAL_GTZC_MPCBB_GetLockConfig()
8. Illegal access detection can be configured through TZIC sub-block using following functions: HAL_GTZC_TZIC_DisableIT() / HAL_GTZC_TZIC_EnableIT()
9. Illegal access flags can be retrieved through HAL_GTZC_TZIC_GetFlag() and HAL_GTZC_TZIC_ClearFlag() functions
10. Illegal access interrupt service routines are served by HAL_GTZC_IRQHandler() and user can add his own code using HAL_GTZC_TZIC_Callback()

33.2.3 Detailed description of functions

HAL_GTZC_TZSC_ConfigPeriphAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_ConfigPeriphAttributes (uint32_t PeriphId, uint32_t PeriphAttributes)

Function description

Configure TZSC on a single peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.
- **PeriphAttributes:** Peripheral attributes, see GTZC TZSC peripheral attribute values.

Return values

- **HAL:** status.

Notes

- Secure and non-secure attributes can only be set from the secure state when the system implements the security (TZEN=1).
- Privilege and non-privilege attributes can only be set from the privilege state when TZEN=0 or TZEN=1
- Security and privilege attributes can be set independently.
- Default state is non-secure and unprivileged access allowed.

HAL_GTZC_TZSC_GetConfigPeriphAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_GetConfigPeriphAttributes (uint32_t PeriphId, uint32_t * PeriphAttributes)

Function description

Get TZSC configuration on a single peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.
- **PeriphAttributes:** Peripheral attribute pointer. This parameter can be a value of GTZC TZSC peripheral attribute values. If PeriphId target a single peripheral, pointer on a single element. If all peripherals selected (GTZC_PERIPH_ALL), pointer to an array of GTZC_TZSC_PERIPH_NUMBER elements is to be provided.

Return values

- **HAL:** status.

HAL_GTZC_TZSC_MPCWM_ConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_MPCWM_ConfigMemAttributes (uint32_t MemBaseAddress, const MPCWM_ConfigTypeDef * pMPCWM_Desc)

Function description

Configure a TZSC-MPCWM area.

Parameters

- **MemBaseAddress:** WM identifier.
- **pMPCWM_Desc:** TZSC-MPCWM descriptor pointer. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_TZSC_MPCWM_GetConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_MPCWM_GetConfigMemAttributes (uint32_t MemBaseAddress, MPCWM_ConfigTypeDef * pMPCWM_Desc)

Function description

Get a TZSC-MPCWM area configuration.

Parameters

- **MemBaseAddress:** WM identifier.
- **pMPCWM_Desc:** pointer to a TZSC-MPCWM descriptor. When the WaterMark memory supports two sub-regions A and B. pMPCWM_Desc argument must point to an array of two MPCWM_ConfigTypeDef structures. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_TZSC_Lock

Function name

void HAL_GTZC_TZSC_Lock (GTZC_TZSC_TypeDef * TZSC_Instance)

Function description

Lock TZSC configuration.

Parameters

- **TZSC_Instance:** TZSC sub-block instance.

Notes

- This function locks the configuration of TZSC_SECCFGRx and TZSC_PRIVCFGRx registers until next reset

HAL_GTZC_TZSC_GetLock

Function name

uint32_t HAL_GTZC_TZSC_GetLock (const GTZC_TZSC_TypeDef * TZSC_Instance)

Function description

Get TZSC configuration lock state.

Parameters

- **TZSC_Instance:** TZSC sub-block instance.

Return values

- **Lock:** State (GTZC_TZSC_LOCK_OFF or GTZC_TZSC_LOCK_ON)

HAL_GTZC_MPCBB_ConfigMem

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_ConfigMem (uint32_t MemBaseAddress, const MPCBB_ConfigTypeDef * pMPCBB_desc)

Function description

Set a complete MPCBB configuration on the SRAM passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.
- **pMPCBB_desc:** pointer to MPCBB descriptor. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_GetConfigMem

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetConfigMem (uint32_t MemBaseAddress, MPCBB_ConfigTypeDef * pMPCBB_desc)

Function description

Get a complete MPCBB configuration on the SRAM passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.
- **pMPCBB_desc:** pointer to a MPCBB descriptor. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_ConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_ConfigMemAttributes (uint32_t MemAddress, uint32_t NbBlocks, const uint32_t * pMemAttributes)

Function description

Set a MPCBB attribute configuration on the SRAM passed as parameter for a number of blocks.

Parameters

- **MemAddress:** MPCBB identifier, and start block to configure (must be 512 Bytes aligned).
- **NbBlocks:** Number of blocks to configure (Block size is 512 Bytes).
- **pMemAttributes:** pointer to an array (containing "NbBlocks" elements), with each element must be GTZC_MPCBB_BLOCK_NSEC or GTZC_MPCBB_BLOCK_SEC, and GTZC_MPCBB_BLOCK_NPRIV or GTZC_MPCBB_BLOCK_PRIV.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_GetConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetConfigMemAttributes (uint32_t MemAddress, uint32_t NbBlocks, uint32_t * pMemAttributes)

Function description

Get a MPCBB attribute configuration on the SRAM passed as parameter for a number of blocks.

Parameters

- **MemAddress:** MPCBB identifier, and start block to get configuration (must be 512 Bytes aligned).
- **NbBlocks:** Number of blocks to get configuration.
- **pMemAttributes:** pointer to an array (containing "NbBlocks" elements), with each element will be GTZC_MPCBB_BLOCK_NSEC or GTZC_MPCBB_BLOCK_SEC, and GTZC_MPCBB_BLOCK_NPRIV or GTZC_MPCBB_BLOCK_PRIV.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_LockConfig

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_LockConfig (uint32_t MemAddress, uint32_t NbSuperBlocks, const uint32_t * pLockAttributes)

Function description

Lock MPCBB super-blocks on the SRAM passed as parameter.

Parameters

- **MemAddress:** MPCBB start-address of super-block to configure (must be 16KBytes aligned).
- **NbSuperBlocks:** Number of super-blocks to configure.
- **pLockAttributes:** pointer to an array (containing "NbSuperBlocks" elements), with for each element: value 0 super-block is unlocked, value 1 super-block is locked (corresponds to GTZC_MPCBB_SUPERBLOCK_UNLOCKED and GTZC_MPCBB_SUPERBLOCK_LOCKED values).

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_GetLockConfig

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetLockConfig (uint32_t MemAddress, uint32_t NbSuperBlocks, uint32_t * pLockAttributes)

Function description

Get MPCBB super-blocks lock configuration on the SRAM passed as parameter.

Parameters

- **MemAddress:** MPCBB start-address of super-block to get configuration (must be 16KBytes aligned).
- **NbSuperBlocks:** Number of super-blocks to get configuration.
- **pLockAttributes:** pointer to an array (containing "NbSuperBlocks" elements), with for each element: value 0 super-block is unlocked, value 1 super-block is locked (corresponds to GTZC_MPCBB_SUPERBLOCK_UNLOCKED and GTZC_MPCBB_SUPERBLOCK_LOCKED values).

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_Lock

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_Lock (uint32_t MemBaseAddress)

Function description

Lock a MPCBB configuration on the SRAM base address passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.

Return values

- **HAL:** status.

Notes

- This functions locks the control register of the MPCBB until next reset.

HAL_GTZC_MPCBB_GetLock

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetLock (uint32_t MemBaseAddress, uint32_t * pLockState)

Function description

Get MPCBB configuration lock state on the SRAM base address passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.
- **pLockState:** pointer to Lock State (GTZC_MPCBB_LOCK_OFF or GTZC_MPCBB_LOCK_ON).

Return values

- **HAL:** status.

HAL_GTZC_TZIC_DisableIT

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_DisableIT (uint32_t PeriphId)

Function description

Disable the interrupt associated to a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.

Return values

- **HAL:** status.

HAL_GTZC_TZIC_EnableIT

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_EnableIT (uint32_t PeriphId)

Function description

Enable the interrupt associated to a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.

Return values

- **HAL:** status.

HAL_GTZC_TZIC_GetFlag

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_GetFlag (uint32_t PeriphId, uint32_t * pFlag)

Function description

Get TZIC flag on a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.
- **pFlag:** Pointer to the flags. If PeriphId target a single peripheral, pointer on a single element. If all peripherals selected (GTZC_PERIPH_ALL), pointer to an array of GTZC_TZIC_PERIPH_NUMBER elements. Element content is either GTZC_TZIC_NO_ILA_EVENT or GTZC_TZSC_ILA_EVENT_PENDING.

Return values

- **HAL:** status

HAL_GTZC_TZIC_ClearFlag

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_ClearFlag (uint32_t PeriphId)

Function description

Clear TZIC flag on a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.

Return values

- **HAL:** status.

HAL_GTZC_IRQHandler

Function name

void HAL_GTZC_IRQHandler (void)

Function description

This function handles GTZC TZIC interrupt request.

Return values

- **None.:**

HAL_GTZC_TZIC_Callback

Function name

void HAL_GTZC_TZIC_Callback (uint32_t PeriphId)

Function description

GTZC TZIC sub-block interrupt callback.

Parameters

- **PeriphId:** Peripheral identifier triggering the illegal access. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values

Return values

- **None.:**

34 HAL HASH Generic Driver

34.1 HASH Firmware driver registers structures

34.1.1 HASH_ConfigTypeDef

HASH_ConfigTypeDef is defined in the stm32h5xx_hal_hash.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint8_t * pKey***
- ***uint32_t Algorithm***

Field Documentation

- ***uint32_t HASH_ConfigTypeDef::DataType***
  no swap (32-bit data), half word swap (16-bit data), byte swap (8-bit data) or bit swap (1-bit data). This parameter can be a value of ***HASH_Data_Type***.
- ***uint32_t HASH_ConfigTypeDef::KeySize***
  The key size is used only in HMAC operation.
- ***uint8_t* HASH_ConfigTypeDef::pKey***
  The key is used only in HMAC operation.
- ***uint32_t HASH_ConfigTypeDef::Algorithm***
  HASH algorithm MD5, SHA1 or SHA2. This parameter can be a value of ***HASH_Algorithm_Selection***

34.1.2 __HASH_HandleTypeDef

__HASH_HandleTypeDef is defined in the stm32h5xx_hal_hash.h

Data Fields

- ***HASH_TypeDef * Instance***
- ***HASH_ConfigTypeDef Init***
- ***uint8_t const * pHashInBuffPtr***
- ***uint8_t * pHashOutBuffPtr***
- ***__IO uint32_t HashInCount***
- ***uint32_t Size***

- ***HAL_HASH_PhaseTypeDef Phase***
- ***DMA_HandleTypeDef * hdmain***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***__IO HAL_HASH_StateTypeDef State***
- ***__IO uint32_t Accumulation***
- ***void(* InCpltCallback***
- ***void(* DgstCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***HASH_TypeDef* __HASH_HandleTypeDef::Instance***
  HASH Register base address
- ***HASH_ConfigTypeDef __HASH_HandleTypeDef::Init***
  HASH required parameters
- ***uint8_t const* __HASH_HandleTypeDef::pHashInBuffPtr***
  Pointer to input buffer

- ***uint8_t* __HASH_HandleTypeDef::pHashOutBuffPtr***
  Pointer to output buffer (digest)
- ***__IO uint32_t __HASH_HandleTypeDef::HashInCount***
  Counter of inputted data
- ***uint32_t __HASH_HandleTypeDef::Size***
  Size of buffer to be processed in bytes
- ***uint8_t* __HASH_HandleTypeDef::pHashKeyBuffPtr***
  Pointer to key buffer (HMAC only)
- ***HAL_HASH_PhaseTypeDef __HASH_HandleTypeDef::Phase***
  HASH peripheral phase
- ***DMA_HandleTypeDef* __HASH_HandleTypeDef::hdmain***
  HASH In DMA Handle parameters
- ***HAL_LockTypeDef __HASH_HandleTypeDef::Lock***
  Locking object
- ***__IO uint32_t __HASH_HandleTypeDef::ErrorCode***
  HASH Error code
- ***__IO HAL_HASH_StateTypeDef __HASH_HandleTypeDef::State***
  HASH peripheral state
- ***__IO uint32_t __HASH_HandleTypeDef::Accumulation***
  HASH multi buffers accumulation flag
- ***void(* __HASH_HandleTypeDef::InCpltCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH input completion callback
- ***void(* __HASH_HandleTypeDef::DgstCpltCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH digest computation complete callback
- ***void(* __HASH_HandleTypeDef::ErrorCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH error callback
- ***void(* __HASH_HandleTypeDef::MspInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp Init callback
- ***void(* __HASH_HandleTypeDef::MspDeInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp DeInit callback

34.2 HASH Firmware driver API description

The following section lists the various functions of the HASH library.

34.2.1 How to use this driver

The HASH HAL driver can be used as follows:

1. Initialize the HASH low level resources by implementing the HAL_HASH_MspInit():
   a. Enable the HASH interface clock using __HAL_RCC_HASH_CLK_ENABLE()
   b. When resorting to interrupt-based APIs (e.g. HAL_HASH_Start_IT())
      - Configure the HASH interrupt priority using HAL_NVIC_SetPriority()
      - Enable the HASH IRQ handler using HAL_NVIC_EnableIRQ()
      - In HASH IRQ handler, call HAL_HASH_IRQHandler() API
   c. When resorting to DMA-based APIs (e.g. HAL_HASH_Start_DMA())
      - Enable the DMA interface clock
      - Configure and enable one DMA to manage data transfer from memory to peripheral (input DMA). Managing data transfer from peripheral to memory can be performed only using CPU.
      - Associate the initialized DMA handle to the HASH DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA: use HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()
2. Initialize the HASH HAL using HAL_HASH_Init(). This function:
   a. resorts to HAL_HASH_MspInit() for low-level initialization,
   b. configures the data type: no swap, half word swap, bit swap or byte swap,
   c. configures the Algorithm : MD5, SHA1 or SHA2

3. Three processing schemes are available:
   a. Polling mode: processing APIs are blocking functions i.e. they process the data and wait till the digest computation is finished, e.g. HAL_HASH_Start() for HASH or HAL_HMAC_Start() for HMAC
   b. Interrupt mode: processing APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_HASH_Start_IT() for HASH or HAL_HMAC_Start_IT() for HMAC
   c. DMA mode: processing APIs are not blocking functions and the CPU is not used for data transfer i.e. the data transfer is ensured by DMA, e.g. HAL_HASH_Start_DMA() for HASH or HAL_HMAC_Start_DMA() for HMAC.
4. When the processing function is called after HAL_HASH_Init(), the HASH peripheral is initialized and processes the buffer fed in input. When the input data have all been fed to the Peripheral, the digest computation can start.
5. Multi-buffer processing HASH and HMAC are possible in polling, interrupt and DMA modes.
   a. In polling mode, API HAL_HASH_Accumulate()/HAL_HASH_HMAC_Accumulate() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_AccumulateLast()/ HAL_HASH_HMAC_AccumulateLast() to enter the last one and retrieve as well the computed digest.
   b. In interrupt mode, API HAL_HASH_Accumulate_IT()/HAL_HASH_HMAC_Accumulate_IT() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_AccumulateLast_IT()/HAL_HASH_HMAC_AccumulateLast_IT() to enter the last one and retrieve as well the computed digest.
   c. In DMA mode, once initialization is done, MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro. From that point, each buffer can be fed to the Peripheral through HAL_HASH_Start_DMA() API for HASH and HAL_HASH_HMAC_Start_DMA() API for HMAC . Before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASH_Start_DMA()for HASH and HAL_HASH_HMAC_Start_DMA() API for HMAC and retrieve as well the computed digest.
6. To use this driver (version 2.0.0) with application developed with old driver (version 1.0.0) user have to:
   a. Add Algorithm as parameter like DataType or KeySize.
   b. Use new API HAL_HASH_Start() for HASH and HAL_HASH_HMAC_Start() for HMAC processing instead of old API like HAL_HASH_SHA1_Start and HAL_HMAC_SHA1_Start.

34.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the HASH according to the specified parameters in the HASH_InitTypeDef and create the associated handle
- DeInitialize the HASH peripheral
- Initialize the HASH MCU Specific Package (MSP)
- DeInitialize the HASH MSP
- Configure HASH (HAL_HASH_SetConfig) with the specified parameters in the HASH_ConfigTypeDef Parameters which are configured in This section are :
- Data Type : no swap, half word swap, bit swap or byte swap
- Algorithm : MD5,SHA1 or SHA2
- Get HASH configuration (HAL_HASH_GetConfig) from the specified parameters in the HASH_HandleTypeDef

This section contains the following APIs:

- ***HAL_HASH_Init()***
- ***HAL_HASH_DeInit()***
- ***HAL_HASH_SetConfig()***
- ***HAL_HASH_GetConfig()***
- ***HAL_HASH_MspInit()***

34.2.3 HASH processing functions

This section provides API allowing to calculate the hash value using one of the HASH algorithms supported by the peripheral.

For a single buffer to be hashed, user can resort to one of three processing functions available .

- Polling mode : HAL_HASH_Start()
- Interrupt mode : HAL_HASH_Start_IT()
- DMA mode : HAL_HASH_Start_DMA()

In case of multi-buffer HASH processing (a single digest is computed while several buffers are fed to the Peripheral), the user can resort to successive calls to :

- Polling mode : HAL_HASH_Accumulate() and wrap-up the digest computation by a call to HAL_HASH_AccumulateLast()
- Interrupt mode : HAL_HASH_Accumulate_IT() and wrap-up the digest computation by a call to HAL_HASH_AccumulateLast_IT()
- DMA mode : HAL_HASH_Start_DMA(), MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro, before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASH_Start_DMA()

This section contains the following APIs:

- *HAL_HASH_Start()*
- *HAL_HASH_Start_IT()*
- *HAL_HASH_Start_DMA()*
- *HAL_HASH_Accumulate()*
- *HAL_HASH_AccumulateLast()*
- *HAL_HASH_Accumulate_IT()*
- *HAL_HASH_AccumulateLast_IT()*

34.2.4 HMAC processing functions

This section provides API allowing to calculate the HMAC (keyed-hash message authentication code) value using:

- one of the algorithms supported by the peripheral
- Key selection
  - Long key : HMAC key is longer than the block size
  - Short key : HMAC key is shorter or equal to the block size

To calculate the HMAC for a single buffer, user can resort to one of three processing functions available .

- Polling mode : HAL_HASH_HMAC_Start()
- Interrupt mode : HAL_HASH_HMAC_Start_IT()
- DMA mode : HAL_HASH_HMAC_Start_DMA()

In case of multi-buffer HMAC processing (a single digest is computed while several buffers are fed to the Peripheral), the user can resort to successive calls to :

- Polling mode : HAL_HASH_HMAC_Accumulate() and wrap-up the digest computation by a call to HAL_HASH_HMAC_AccumulateLast()
- Interrupt mode : HAL_HASH_HMAC_Accumulate_IT() and wrap-up the digest computation by a call to HAL_HASH_HMAC_AccumulateLast_IT()
- DMA mode : HAL_HASH_HMAC_Start_DMA(),MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro, before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HMAC processing in feeding the last input buffer through the same API HAL_HASH_HMAC_Start_DMA()

This section contains the following APIs:

- *HAL_HASH_HMAC_Start()*

- *HAL_HASH_HMAC_Accumulate()*
- *HAL_HASH_HMAC_AccumulateLast()*
- *HAL_HASH_HMAC_Start_IT()*
- *HAL_HASH_HMAC_Accumulate_IT()*
- *HAL_HASH_HMAC_AccumulateLast_IT()*
- *HAL_HASH_HMAC_Start_DMA()*

34.2.5 HASH IRQ handler management

This section provides HASH IRQ handler and callback functions.

- HAL_HASH_IRQHandler HASH interrupt request
- HAL_HASH_InCpltCallback input data transfer complete callback
- HAL_HASH_DgstCpltCallback digest computation complete callback
- HAL_HASH_ErrorCallback HASH error callback
- HAL_HASH_GetState return the HASH state
- HAL_HASH_GetError return the HASH error code

This section contains the following APIs:

- *HAL_HASH_IRQHandler()*
- *HAL_HASH_InCpltCallback()*
- *HAL_HASH_DgstCpltCallback()*
- *HAL_HASH_ErrorCallback()*
- *HAL_HASH_GetState()*
- *HAL_HASH_GetError()*

34.2.6 Detailed description of functions

HAL_HASH_Init

Function name

HAL_StatusTypeDef HAL_HASH_Init (HASH_HandleTypeDef * hhash)

Function description

Initializes the HASH according to the specified parameters in the HASH_HandleTypeDef and create the associated handle.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **HAL:** status

Notes

- Only Algorithm and DATATYPE bits of HASH Peripheral are set by HAL_HASH_Init(), other configuration bits are set by HASH or HMAC processing APIs.

HAL_HASH_DeInit

Function name

HAL_StatusTypeDef HAL_HASH_DeInit (HASH_HandleTypeDef * hhash)

Function description

DeInitialize the HASH peripheral.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **HAL:** status

HAL_HASH_MspInit

Function name

void HAL_HASH_MspInit (HASH_HandleTypeDef * hhash)

Function description

Initialize the HASH MSP.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **None:**

HAL_HASH_MspDeInit

Function name

void HAL_HASH_MspDeInit (HASH_HandleTypeDef * hhash)

Function description

DeInitialize the HASH MSP.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **None:**

HAL_HASH_GetConfig

Function name

HAL_StatusTypeDef HAL_HASH_GetConfig (HASH_HandleTypeDef * hhash, HASH_ConfigTypeDef * pConf)

Function description

Get HASH Configuration parameters in associated handle.

Parameters

- **pConf:** pointer to a HASH_HandleTypeDef structure
- **hhash:** pointer to a HASH_ConfigTypeDef structure that contains the configuration information for HASH module

Return values

- **HAL:** status

HAL_HASH_SetConfig

Function name

HAL_StatusTypeDef HAL_HASH_SetConfig (HASH_HandleTypeDef * hhash, HASH_ConfigTypeDef * pConf)

Function description

Configure the HASH according to the specified parameters in the HASH_ConfigTypeDef.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure
- **pConf:** pointer to a HASH_ConfigTypeDef structure that contains the configuration information for HASH module

Return values

- **HAL:** status

HAL_HASH_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HASH_RegisterCallback (HASH_HandleTypeDef * hhash, HAL_HASH_CallbackIDTypeDef CallbackID, pHASH_CallbackTypeDef pCallback)

Function description

Register a User HASH Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hhash:** HASH handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_HASH_INPUTCPLT_CB_ID input completion callback ID
  - HAL_HASH_DGSTCPLT_CB_ID digest computation completion callback ID
  - HAL_HASH_ERROR_CB_ID error callback ID
  - HAL_HASH_MSPINIT_CB_ID MspInit callback ID
  - HAL_HASH_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_HASH_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HASH_UnRegisterCallback (HASH_HandleTypeDef * hhash, HAL_HASH_CallbackIDTypeDef CallbackID)

Function description

Unregister a HASH Callback HASH Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hhash:** HASH handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_HASH_INPUTCPLT_CB_ID HASH input completion Callback ID
  - HAL_HASH_DGSTCPLT_CB_ID HASH digest computation completion Callback ID
  - HAL_HASH_ERROR_CB_ID HASH error Callback ID
  - HAL_HASH_MSPINIT_CB_ID HASH MspInit callback ID
  - HAL_HASH_MSPDEINIT_CB_ID HASH MspDeInit callback ID

Return values

- **status:**

HAL_HASH_ProcessSuspend

Function name

HAL_StatusTypeDef HAL_HASH_ProcessSuspend (HASH_HandleTypeDef * hhash)

Function description

HAL_HASH_Resume

Function name

void HAL_HASH_Resume (HASH_HandleTypeDef * hhash, uint8_t * pMemBuffer)

Function description

HAL_HASH_Suspend

Function name

void HAL_HASH_Suspend (HASH_HandleTypeDef * hhash, uint8_t * pMemBuffer)

Function description

HAL_HASH_Start

Function name

HAL_StatusTypeDef HAL_HASH_Start (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer, uint32_t Timeout)

Function description

HASH peripheral processes in polling mode pInBuffer then reads the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** specify timeout value

Return values

- **HAL:** status

HAL_HASH_Start_IT

Function name

HAL_StatusTypeDef HAL_HASH_Start_IT (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer)

Function description

HASH peripheral processes in interrupt mode pInBuffer then reads the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.

Return values

- **HAL:** status

HAL_HASH_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASH_Start_DMA (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer)

Function description

HASH peripheral processes in DMA mode pInBuffer then reads the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes (must be a multiple of 4 in case of Multi-buffer and not last buffer).
- **pOutBuffer:** pointer to the computed digest.

Return values

- **HAL:** status

Notes

- Multi-buffer HASH processing is possible, consecutive calls to HAL_HASH_Start_DMA (MDMAT bit must be set) can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_Start_DMA (MDMAT bit must be reset).

HAL_HASH_Accumulate

Function name

HAL_StatusTypeDef HAL_HASH_Accumulate (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint32_t Timeout)

Function description

HASH peripheral processes in polling mode several input buffers.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes and a multiple of 4.
- **Timeout:** specify timeout value

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_Accumulate() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_AccumulateLast()

HAL_HASH_AccumulateLast

Function name

HAL_StatusTypeDef HAL_HASH_AccumulateLast (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_Accumulate() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** specify timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer

HAL_HASH_AccumulateLast_IT

Function name

HAL_StatusTypeDef HAL_HASH_AccumulateLast_IT (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_Accumulate_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer

HAL_HASH_Accumulate_IT

Function name

HAL_StatusTypeDef HAL_HASH_Accumulate_IT (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size)

Function description

HASH peripheral processes in interrupt mode several input buffers.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes and a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_Accumulate_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_AccumulateLast_IT()

HAL_HASH_HMAC_Start

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_Start (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer, uint32_t Timeout)

Function description

HMAC in polling mode, HASH peripheral processes Key then pInBuffer then reads the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** specify timeout value

Return values

- **HAL:** status

HAL_HASH_HMAC_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_Start_DMA (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer)

Function description

HMAC in DMA mode,HASH peripheral processes Key then pInBuffer in DMA mode then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.

Return values

- **HAL:** status

Notes

- Multi-buffer HMAC processing is possible, consecutive calls to HAL_HASH_HMAC_Start_DMA (MDMAT bit must be set) can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_HMAC_Start_DMA (MDMAT bit must be reset).

HAL_HASH_HMAC_Start_IT

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_Start_IT (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer)

Function description

HMAC in interrupt mode, HASH peripheral process Key then pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.

Return values

- **HAL:** status

HAL_HASH_HMAC_Accumulate

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_Accumulate (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint32_t Timeout)

Function description

HMAC accumulate mode, HASH peripheral processes Key then several input buffers.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes and a multiple of 4
- **Timeout:** specify timeout value

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_HMAC_Accumulate() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_HMAC_AccumulateLast()

HAL_HASH_HMAC_AccumulateLast

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_AccumulateLast (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HMAC signature after several calls to HAL_HASH_HMAC_Accumulate() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** specify timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer

HAL_HASH_HMAC_Accumulate_IT

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_Accumulate_IT (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size)

Function description

HMAC accumulate in interrupt mode, HASH peripheral processes Key then several input buffers.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes and a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_HMAC_Accumulate_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_HMAC_AccumulateLast_IT()

HAL_HASH_HMAC_AccumulateLast_IT

Function name

HAL_StatusTypeDef HAL_HASH_HMAC_AccumulateLast_IT (HASH_HandleTypeDef * hhash, const uint8_t *const pInBuffer, uint32_t Size, uint8_t *const pOutBuffer)

Function description

End computation of a single HMAC signature in interrupt mode, after several calls to HAL_HASH_HMAC_Accumulate() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer

HAL_HASH_IRQHandler

Function name

void HAL_HASH_IRQHandler (HASH_HandleTypeDef * hhash)

Function description

Handle HASH interrupt request.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_IRQHandler() handles interrupts in HMAC processing as well.

HAL_HASH_InCpltCallback

Function name

void HAL_HASH_InCpltCallback (HASH_HandleTypeDef * hhash)

Function description

Input data transfer complete call back.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **None:**

Notes

- HAL_HASH_InCpltCallback() is called when the complete input message has been fed to the Peripheral. This API is invoked only when input data are entered under interruption or through DMA.
- In case of HASH or HMAC multi-buffer DMA feeding case (MDMAT bit set), HAL_HASH_InCpltCallback() is called at the end of each buffer feeding to the Peripheral.

HAL_HASH_DgstCpltCallback

Function name

void HAL_HASH_DgstCpltCallback (HASH_HandleTypeDef * hhash)

Function description

Digest computation complete call back.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **None:**

Notes

- HAL_HASH_DgstCpltCallback() is used under interruption, is not relevant with DMA.

HAL_HASH_ErrorCallback

Function name

void HAL_HASH_ErrorCallback (HASH_HandleTypeDef * hhash)

Function description

HASH error callback.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure that contains the configuration information for HASH module.

Return values

- **None:**

Notes

- Code user can resort to hhash->Status (HAL_ERROR, HAL_TIMEOUT,...) to retrieve the error type.

HAL_HASH_GetState

Function name

HAL_HASH_StateTypeDef HAL_HASH_GetState (const HASH_HandleTypeDef * hhash)

Function description

Return the HASH handle state.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** HASH state

Notes

- The API yields the current state of the handle (BUSY, READY,...).

HAL_HASH_GetError

Function name

uint32_t HAL_HASH_GetError (const HASH_HandleTypeDef * hhash)

Function description

Return the HASH handle error code.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure.

Return values

- **HASH:** Error Code

34.3 HASH Firmware driver defines

The following section lists the various define and macros of the module.

34.3.1 HASH

HASH

HASH algorithm selection

HASH_ALGOSELECTION_SHA1

HASH function is SHA1

HASH_ALGOSELECTION_SHA224

HASH function is SHA224

HASH_ALGOSELECTION_SHA256

HASH function is SHA256

HASH_ALGOSELECTION_SHA384

HASH function is SHA384

HASH_ALGOSELECTION_SHA512_224

HASH function is SHA512_224

HASH_ALGOSELECTION_SHA512_256

HASH function is SHA512_256

HASH_ALGOSELECTION_SHA512

HASH function is SHA512

HASH Data Type

HASH_NO_SWAP

32-bit data. No swapping

HASH_HALFWORD_SWAP

16-bit data. Each half word is swapped

HASH_BYTE_SWAP

8-bit data. All bytes are swapped

HASH_BIT_SWAP

1-bit data. In the word all bits are swapped

HASH Error Definition

HAL_HASH_ERROR_NONE

No error

HAL_HASH_ERROR_BUSY

Busy flag error

HAL_HASH_ERROR_DMA

DMA-based process error

HAL_HASH_ERROR_TIMEOUT

Timeout error

HAL_HASH_ERROR_INVALID_CALLBACK

Invalid Callback error

HASH Exported Macros

__HAL_HASH_GET_FLAG

Description:

- Check whether or not the specified HASH flag is set.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete.
  - HASH_FLAG_DMAS DMA interface is enabled (DMAE=1) or a transfer is ongoing.
  - HASH_FLAG_BUSY The hash core is Busy : processing a block of data.
  - HASH_FLAG_DINNE DIN not empty : the input buffer contains at least one word of data.

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_HASH_CLEAR_FLAG

Description:

- Clear the specified HASH flag.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete

Return value:

- None

__HAL_HASH_GET_IT_SOURCE

Description:

- Check whether the specified HASH interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __INTERRUPT__: HASH interrupt source to check This parameter can be one of the following values :
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- State: of interruption (TRUE or FALSE).

__HAL_HASH_ENABLE_IT

Description:

- Enable the specified HASH interrupt.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __INTERRUPT__: specifies the HASH interrupt source to enable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- None

__HAL_HASH_DISABLE_IT

Description:

- Disable the specified HASH interrupt.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __INTERRUPT__: specifies the HASH interrupt source to disable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- None

__HAL_HASH_RESET_HANDLE_STATE

Description:

- Reset HASH handle state.

Parameters:

- __HANDLE__: HASH handle.

Return value:

- None

__HAL_HASH_SET_MDMAT

Description:

- Enable the multi-buffer DMA transfer mode.

Return value:

- None

Notes:

- This bit is set when hashing large files when multiple DMA transfers are needed.

__HAL_HASH_RESET_MDMAT

Description:

- Disable the multi-buffer DMA transfer mode.

Return value:

- None

HAL_HASH_VERSION

Description:

- HAL HASH driver version.

Return value:

- None: HAL HASH driver version 2.0.0

HASH flags definitions

HASH_FLAG_DINIS

16 locations are free in the DIN : new block can be entered in the Peripheral

HASH_FLAG_DCIS

Digest calculation complete

HASH_FLAG_DMAS

DMA interface is enabled (DMAE=1) or a transfer is ongoing

HASH_FLAG_BUSY

The hash core is Busy, processing a block of data

HASH_FLAG_DINNE

DIN not empty : input buffer contains at least one word of data

key length only for HMAC mode

HASH_SHORTKEY

HMAC Key size is <= block size (64 or 128 bytes)

HASH_LONGKEY

HMAC Key size is > block size (64 or 128 bytes)

HASH interrupts definitions

HASH_IT_DINI

A new block can be entered into the input buffer (DIN)

HASH_IT_DCI

Digest calculation complete

HASH Mode

HASH_ALGOMODE_HASH

HASH mode

HASH_ALGOMODE_HMAC

HMAC mode

HASH Number of Context Swap Registers

HASH_NUMBER_OF_CSR_REGISTERS

Number of Context Swap Registers

35 HAL HCD Generic Driver

- ***void(* __HCD_HandleTypeDef::MspDeInitCallback)(struct __HCD_HandleTypeDef *hhcd)***
  USB OTG HCD Msp DeInit callback

35.2 HCD Firmware driver API description

The following section lists the various functions of the HCD library.

35.2.1 How to use this driver

1. Declare a HCD_HandleTypeDef handle structure, for example: HCD_HandleTypeDef hhcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_HCD_Init() API to initialize the HCD peripheral (Core, Host core, ...)
4. Initialize the HCD low level resources through the HAL_HCD_MspInit() API:
   a. Enable the HCD/USB Low Level interface clock using the following macros
      ◦ __HAL_RCC_USB_CLK_ENABLE();
   b. Initialize the related GPIO clocks
   c. Configure HCD pin-out
   d. Configure HCD NVIC interrupt
5. Associate the Upper USB Host stack to the HAL HCD Driver:
   a. hhcd.pData = phost;
6. Enable HCD transmission and reception:
   a. HAL_HCD_Start();

35.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

This section contains the following APIs:

- ***HAL_HCD_Init()***
- ***HAL_HCD_HC_Init()***
- ***HAL_HCD_HC_Close()***
- ***HAL_HCD_HC_Halt()***
- ***HAL_HCD_DeInit()***
- ***HAL_HCD_MspInit()***
- ***HAL_HCD_MspDeInit()***
- ***HAL_HCD_SuspendCallback()***
- ***HAL_HCD_ResumeCallback()***
- ***HAL_HCD_RegisterCallback()***
- ***HAL_HCD_UnRegisterCallback()***

- *HAL_HCD_RegisterHC_NotifyURBChangeCallback()*
- *HAL_HCD_UnRegisterHC_NotifyURBChangeCallback()*

35.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the USB Host Data Transfer
This section contains the following APIs:

- *HAL_HCD_HC_SubmitRequest()*
- *HAL_HCD_IRQHandler()*
- *HAL_HCD_SOF_Callback()*
- *HAL_HCD_Connect_Callback()*
- *HAL_HCD_Disconnect_Callback()*
- *HAL_HCD_PortEnabled_Callback()*
- *HAL_HCD_PortDisabled_Callback()*
- *HAL_HCD_HC_NotifyURBChange_Callback()*
- *HAL_HCD_RegisterCallback()*
- *HAL_HCD_UnRegisterCallback()*
- *HAL_HCD_RegisterHC_NotifyURBChangeCallback()*
- *HAL_HCD_UnRegisterHC_NotifyURBChangeCallback()*
- *HAL_HCD_HC_SetHubInfo()*
- *HAL_HCD_HC_ClearHubInfo()*
- *HAL_HCD_SuspendCallback()*
- *HAL_HCD_ResumeCallback()*

35.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the HCD data transfers.
This section contains the following APIs:

- *HAL_HCD_Start()*
- *HAL_HCD_Stop()*
- *HAL_HCD_Suspend()*
- *HAL_HCD_Resume()*
- *HAL_HCD_ResetPort()*
- *HAL_HCD_ResumePort()*

35.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.
This section contains the following APIs:

- *HAL_HCD_GetState()*
- *HAL_HCD_HC_GetURBState()*
- *HAL_HCD_HC_GetXferCount()*
- *HAL_HCD_HC_GetState()*
- *HAL_HCD_GetCurrentFrame()*
- *HAL_HCD_GetCurrentSpeed()*
- *HAL_HCD_HC_SetHubInfo()*
- *HAL_HCD_HC_ClearHubInfo()*
- *HAL_HCD_PMAlloc()*
- *HAL_HCD_PMADeAlloc()*
- *HAL_HCD_PMAReset()*

35.2.6 Detailed description of functions

HAL_HCD_Init

Function name

HAL_StatusTypeDef HAL_HCD_Init (HCD_HandleTypeDef * hhcd)

Function description

Initialize the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_DeInit

Function name

HAL_StatusTypeDef HAL_HCD_DeInit (HCD_HandleTypeDef * hhcd)

Function description

DeInitialize the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_HC_Init

Function name

HAL_StatusTypeDef HAL_HCD_HC_Init (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t epnum, uint8_t dev_address, uint8_t speed, uint8_t ep_type, uint16_t mps)

Function description

Initialize a host channel.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **epnum:** Endpoint number. This parameter can be a value from 1 to 15
- **dev_address:** Current device address This parameter can be a value from 0 to 255
- **speed:** Current device speed. This parameter can be one of these values: HCD_DEVICE_SPEED_HIGH High speed mode, HCD_DEVICE_SPEED_FULL Full speed mode, HCD_DEVICE_SPEED_LOW Low speed mode
- **ep_type:** Endpoint Type. This parameter can be one of these values: USBH_EP_CONTROL Control type, USBH_EP_ISO Isochronous type, USBH_EP_BULK Bulk type, USBH_EP_INTERRUPT Interrupt type
- **mps:** Max Packet Size. This parameter can be a value from 0 to32K

Return values

- **HAL:** status

HAL_HCD_HC_Halt

Function name

HAL_StatusTypeDef HAL_HCD_HC_Halt (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

Halt a host channel.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15

Return values

- **HAL:** status

HAL_HCD_HC_Close

Function name

HAL_StatusTypeDef HAL_HCD_HC_Close (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

HAL_HCD_HC_Close Pipe.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15

Return values

- **HAL:** status

HAL_HCD_MspInit

Function name

void HAL_HCD_MspInit (HCD_HandleTypeDef * hhcd)

Function description

Initialize the HCD MSP.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_MspDeInit

Function name

void HAL_HCD_MspDeInit (HCD_HandleTypeDef * hhcd)

Function description

DeInitialize the HCD MSP.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HCD_RegisterCallback (HCD_HandleTypeDef * hhcd, HAL_HCD_CallbackIDTypeDef CallbackID, pHCD_CallbackTypeDef pCallback)

Function description

Register a User USB HCD Callback To be used instead of the weak predefined callback.

Parameters

- **hhcd:** USB HCD handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_HCD_SOF_CB_ID USB HCD SOF callback ID
  - HAL_HCD_CONNECT_CB_ID USB HCD Connect callback ID
  - HAL_HCD_DISCONNECT_CB_ID HCD Disconnect callback ID
  - HAL_HCD_PORT_ENABLED_CB_ID USB HCD Port Enable callback ID
  - HAL_HCD_PORT_DISABLED_CB_ID USB HCD Port Disable callback ID
  - HAL_HCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_HCD_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_HCD_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HCD_UnRegisterCallback (HCD_HandleTypeDef * hhcd, HAL_HCD_CallbackIDTypeDef CallbackID)

Function description

Unregister an USB HCD Callback USB HCD callback is redirected to the weak predefined callback.

Parameters

- **hhcd:** USB HCD handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_HCD_SOF_CB_ID USB HCD SOF callback ID
  - HAL_HCD_CONNECT_CB_ID USB HCD Connect callback ID
  - HAL_HCD_DISCONNECT_CB_ID DRD HCD Disconnect callback ID
  - HAL_HCD_PORT_ENABLED_CB_ID USB HCD Port Enabled callback ID
  - HAL_HCD_PORT_DISABLED_CB_ID USB HCD Port Disabled callback ID
  - HAL_HCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_HCD_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_HCD_RegisterHC_NotifyURBChangeCallback

Function name

HAL_StatusTypeDef HAL_HCD_RegisterHC_NotifyURBChangeCallback (HCD_HandleTypeDef * hhcd, pHCD_HC_NotifyURBChangeCallbackTypeDef pCallback)

Function description

Register USB HCD Host Channel Notify URB Change Callback To be used instead of the weak HAL_HCD_HC_NotifyURBChange_Callback() predefined callback.

Parameters

- **hhcd:** HCD handle
- **pCallback:** pointer to the USB HCD Host Channel Notify URB Change Callback function

Return values

- **HAL:** status

HAL_HCD_UnRegisterHC_NotifyURBChangeCallback

Function name

HAL_StatusTypeDef HAL_HCD_UnRegisterHC_NotifyURBChangeCallback (HCD_HandleTypeDef * hhcd)

Function description

Unregister the USB HCD Host Channel Notify URB Change Callback USB HCD Host Channel Notify URB Change Callback is redirected to the weak HAL_HCD_HC_NotifyURBChange_Callback() predefined callback.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_HC_SubmitRequest

Function name

HAL_StatusTypeDef HAL_HCD_HC_SubmitRequest (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t direction, uint8_t ep_type, uint8_t token, uint8_t * pbuff, uint16_t length, uint8_t do_ping)

Function description

Submit a new URB for processing.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **direction:** Channel number. This parameter can be one of these values: 0 : Output / 1 : Input
- **ep_type:** Endpoint Type. This parameter can be one of these values: USBH_EP_CONTROL : Control type/ USBH_EP_ISO : Isochronous type/ USBH_EP_BULK : Bulk type/ USBH_EP_INTERRUPT : Interrupt type/
- **token:** Endpoint Type. This parameter can be one of these values: 0: HC_PID_SETUP / 1: HC_PID_DATA1
- **pbuff:** pointer to URB data
- **length:** Length of URB data
- **do_ping:** activate do ping protocol (for high speed only). This parameter can be one of these values: 0 : do ping inactive / 1 : do ping active

Return values

- **HAL:** status

HAL_HCD_HC_SetHubInfo

Function name

HAL_StatusTypeDef HAL_HCD_HC_SetHubInfo (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t addr, uint8_t PortNbr)

Function description

Set host channel Hub Information.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 8
- **addr:** Hub address
- **PortNbr:** Hub port number

Return values

- **HAL:** status

HAL_HCD_HC_ClearHubInfo

Function name

HAL_StatusTypeDef HAL_HCD_HC_ClearHubInfo (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

Clear host channel hub information.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 8

Return values

- **HAL:** status

HAL_HCD_IRQHandler

Function name

void HAL_HCD_IRQHandler (HCD_HandleTypeDef * hhcd)

Function description

Handle HCD interrupt request.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_SOF_Callback

Function name

void HAL_HCD_SOF_Callback (HCD_HandleTypeDef * hhcd)

Function description

SOF callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_Connect_Callback

Function name

void HAL_HCD_Connect_Callback (HCD_HandleTypeDef * hhcd)

Function description

Connection Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_Disconnect_Callback

Function name

void HAL_HCD_Disconnect_Callback (HCD_HandleTypeDef * hhcd)

Function description

Disconnection Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_PortEnabled_Callback

Function name

void HAL_HCD_PortEnabled_Callback (HCD_HandleTypeDef * hhcd)

Function description

Port Enabled Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_PortDisabled_Callback

Function name

void HAL_HCD_PortDisabled_Callback (HCD_HandleTypeDef * hhcd)

Function description

Port Disabled Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_SuspendCallback

Function name

void HAL_HCD_SuspendCallback (HCD_HandleTypeDef * hhcd)

Function description

HAL_HCD_ResumeCallback

Function name

void HAL_HCD_ResumeCallback (HCD_HandleTypeDef * hhcd)

Function description

HAL_HCD_HC_NotifyURBChange_Callback

Function name

void HAL_HCD_HC_NotifyURBChange_Callback (HCD_HandleTypeDef * hhcd, uint8_t chnum, HCD_URBStateTypeDef urb_state)

Function description

Notify URB state change callback.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15
- **urb_state:** This parameter can be one of these values: URB_IDLE/ URB_DONE/ URB_NOTREADY/ URB_NYET/ URB_ERROR/ URB_STALL/

Return values

- **None:**

HAL_HCD_ResetPort

Function name

HAL_StatusTypeDef HAL_HCD_ResetPort (HCD_HandleTypeDef * hhcd)

Function description

Reset the host port.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Start

Function name

HAL_StatusTypeDef HAL_HCD_Start (HCD_HandleTypeDef * hhcd)

Function description

Start the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Stop

Function name

HAL_StatusTypeDef HAL_HCD_Stop (HCD_HandleTypeDef * hhcd)

Function description

Stop the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Suspend

Function name

HAL_StatusTypeDef HAL_HCD_Suspend (HCD_HandleTypeDef * hhcd)

Function description

Put the Device in suspend mode.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Resume

Function name

HAL_StatusTypeDef HAL_HCD_Resume (HCD_HandleTypeDef * hhcd)

Function description

Resume host port.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_ResumePort

Function name

HAL_StatusTypeDef HAL_HCD_ResumePort (HCD_HandleTypeDef * hhcd)

Function description

Resme the host port.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_GetState

Function name

HCD_StateTypeDef HAL_HCD_GetState (HCD_HandleTypeDef const * hhcd)

Function description

Return the HCD handle state.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** state

HAL_HCD_HC_GetURBState

Function name

HCD_URBStateTypeDef HAL_HCD_HC_GetURBState (HCD_HandleTypeDef const * hhcd, uint8_t chnum)

Function description

Return URB state for a channel.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **URB:** state. This parameter can be one of these values: URB_IDLE/ URB_DONE/ URB_NOTREADY/ URB_NYET/ URB_ERROR/ URB_STALL

HAL_HCD_HC_GetState

Function name

HCD_HCStateTypeDef HAL_HCD_HC_GetState (HCD_HandleTypeDef const * hhcd, uint8_t chnum)

Function description

Return the Host Channel state.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **Host:** channel state This parameter can be one of these values: HC_IDLE/ HC_XFRC/ HC_HALTED/ HC_NYET/ HC_NAK/ HC_STALL/ HC_XACTERR/ HC_BBLERR/ HC_DATATGLERR

HAL_HCD_HC_GetXferCount

Function name

uint32_t HAL_HCD_HC_GetXferCount (HCD_HandleTypeDef const * hhcd, uint8_t chnum)

Function description

Return the last host transfer size.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **last:** transfer size in byte

HAL_HCD_GetCurrentFrame

Function name

uint32_t HAL_HCD_GetCurrentFrame (HCD_HandleTypeDef * hhcd)

Function description

Return the current Host frame number.

Parameters

- **hhcd:** HCD handle

Return values

- **Current:** Host frame number

HAL_HCD_GetCurrentSpeed

Function name

uint32_t HAL_HCD_GetCurrentSpeed (HCD_HandleTypeDef * hhcd)

Function description

Return the Host enumeration speed.

Parameters

- **hhcd:** HCD handle

Return values

- **speed:** : Device speed after Host enumeration This parameter can be one of these values:
  - HCD_DEVICE_SPEED_FULL: Full speed mode
  - HCD_DEVICE_SPEED_LOW: Low speed mode

HAL_HCD_PMAlloc

Function name

HAL_StatusTypeDef HAL_HCD_PMAlloc (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint16_t ch_kind, uint16_t mps)

Function description

Allocate PMA buffer for Channel This API will fetch a free space.

Parameters

- **hhcd:** Host instance
- **ch_num:** Channel number
- **ch_kind:** endpoint Kind USB_SNG_BUF Single Buffer used USB_DBL_BUF Double Buffer used
- **mps:** Channel Max Packet Size

Return values

- **HAL:** status

HAL_HCD_PMADeAlloc

Function name

HAL_StatusTypeDef HAL_HCD_PMADeAlloc (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

PMA De-Allocation for Channel Free the reserved block in the PMA-LookupTable.

Parameters

- **hhcd:** Host instance
- **ch_num:** Channel number

Return values

- **HAL:** status

HAL_HCD_PMAReset

Function name

HAL_StatusTypeDef HAL_HCD_PMAReset (HCD_HandleTypeDef * hhcd)

Function description

PMA Reset.

Parameters

- **hhcd:** Host instance

Return values

- **HAL:** status

HCD_GET_CH_RX_CNT

Function name

__STATIC_INLINE uint16_t HCD_GET_CH_RX_CNT (HCD_TypeDef * Instance, uint16_t bChNum)

Function description

gets counter of the rx buffer.

Parameters

- **Instance:** USB peripheral instance register address.
- **bChNum:** channel Number.

Return values

- **Counter:** value

HCD_GET_CH_DBUF0_CNT

Function name

__STATIC_INLINE uint16_t HCD_GET_CH_DBUF0_CNT (const HCD_TypeDef * Instance, uint16_t bChNum)

Function description

gets counter of the rx buffer0.

Parameters

- **Instance:** USB peripheral instance register address.
- **bChNum:** channel Number.

Return values

- **Counter:** value

HCD_GET_CH_DBUF1_CNT

Function name

__STATIC_INLINE uint16_t HCD_GET_CH_DBUF1_CNT (const HCD_TypeDef * Instance, uint16_t bChNum)

Function description

gets counter of the rx buffer1.

Parameters

- **Instance:** USB peripheral instance register address.
- **bChNum:** channel Number.

Return values

- **Counter:** value

35.3 HCD Firmware driver defines

The following section lists the various define and macros of the module.

35.3.1 HCD

HCD

HCD Device Speed

HCD_DEVICE_SPEED_HIGH

HCD_DEVICE_SPEED_FULL

HCD_DEVICE_SPEED_LOW

HCD Endpoint Kind

HCD_SNG_BUF

HCD_DBL_BUF

HCD Error Code definition

HAL_HCD_ERROR_INVALID_CALLBACK

Invalid Callback error

HCD Exported Macros

__HAL_HCD_ENABLE

__HAL_HCD_DISABLE

__HAL_HCD_GET_FLAG

__HAL_HCD_CLEAR_FLAG

__HAL_HCD_IS_INVALID_INTERRUPT

__HAL_HCD_GET_CHNUM

__HAL_HCD_GET_CHDIR

HCD State Structure definition

PMA_BLOCKS

HCD Logical Channel

HCD_LOGICAL_CH_NOT_OPENED

HCD_FREE_CH_NOT_FOUND

HCD PHY Module

HCD_PHY_ULPI

HCD_PHY_EMBEDDED

HCD Speed

HCD_SPEED_FULL

HCD_SPEED_LOW

36 HAL I2C Generic Driver

36.1 I2C Firmware driver registers structures

36.1.1 I2C_InitTypeDef

I2C_InitTypeDef is defined in the stm32h5xx_hal_i2c.h

Data Fields

- ***uint32_t Timing***
- ***uint32_t OwnAddress1***
- ***uint32_t AddressingMode***
- ***uint32_t DualAddressMode***
- ***uint32_t OwnAddress2***
- ***uint32_t OwnAddress2Masks***
- ***uint32_t GeneralCallMode***
- ***uint32_t NoStretchMode***

Field Documentation

- ***uint32_t I2C_InitTypeDef::Timing***
  Specifies the I2C_TIMINGR_register value. This parameter calculated by referring to I2C initialization section in Reference manual
- ***uint32_t I2C_InitTypeDef::OwnAddress1***
  Specifies the first device own address. This parameter can be a 7-bit or 10-bit address.
- ***uint32_t I2C_InitTypeDef::AddressingMode***
  Specifies if 7-bit or 10-bit addressing mode is selected. This parameter can be a value of ***I2C_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::DualAddressMode***
  Specifies if dual addressing mode is selected. This parameter can be a value of ***I2C_DUAL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::OwnAddress2***
  Specifies the second device own address if dual addressing mode is selected This parameter can be a 7-bit address.
- ***uint32_t I2C_InitTypeDef::OwnAddress2Masks***
  Specifies the acknowledge mask address second device own address if dual addressing mode is selected. This parameter can be a value of ***I2C_OWN_ADDRESS2_MASKS***
- ***uint32_t I2C_InitTypeDef::GeneralCallMode***
  Specifies if general call mode is selected. This parameter can be a value of ***I2C_GENERAL_CALL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::NoStretchMode***
  Specifies if nostretch mode is selected. This parameter can be a value of ***I2C_NOSTRETCH_MODE***

36.1.2 __I2C_HandleTypeDef

__I2C_HandleTypeDef is defined in the stm32h5xx_hal_i2c.h

Data Fields

- ***I2C_TypeDef * Instance***
- ***I2C_InitTypeDef Init***
- ***uint8_t * pBuffPtr***
- ***uint16_t XferSize***
- ***__IO uint16_t XferCount***

  I2C Msp DeInit callback

36.2 I2C Firmware driver API description

The following section lists the various functions of the I2C library.

36.2.1 How to use this driver

The I2C HAL driver can be used as follows:

1. Declare a I2C_HandleTypeDef handle structure, for example: I2C_HandleTypeDef hi2c;
2. Initialize the I2C low level resources by implementing the HAL_I2C_MspInit() API:
   a. Enable the I2Cx interface clock
   b. I2C pins configuration
      - Enable the clock for the I2C GPIOs
      - Configure I2C pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the I2Cx interrupt priority
      - Enable the NVIC I2C IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the transmit or receive channel
      - Enable the DMAx interface clock using
      - Configure the DMA handle parameters
      - Configure the DMA Tx or Rx channel
      - Associate the initialized DMA handle to the hi2c DMA Tx or Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx channel

3. Configure the Communication Clock Timing, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call and Nostretch mode in the hi2c Init structure.
4. Initialize the I2C registers by calling the HAL_I2C_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_I2C_MspInit(&hi2c) API.
5. To check if target device is ready for communication, use the function HAL_I2C_IsDeviceReady()
6. For I2C IO and IO MEM operations, three operation modes are available within this driver :

Polling mode IO operation

- Transmit in master mode an amount of data in blocking mode using HAL_I2C_Master_Transmit()
- Receive in master mode an amount of data in blocking mode using HAL_I2C_Master_Receive()
- Transmit in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Transmit()
- Receive in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Receive()

Polling mode IO MEM operation

- Write an amount of data in blocking mode to a specific memory address using HAL_I2C_Mem_Write()
- Read an amount of data in blocking mode from a specific memory address using HAL_I2C_Mem_Read()

Interrupt mode IO operation

- Transmit in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Transmit_IT()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
- Receive in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Receive_IT()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Transmit_IT()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Receive_IT()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode or DMA mode IO sequential operation

Note: These interfaces allow to manage a sequential transfer with a repeated start condition when a direction change during transfer

- A specific option field manage the different steps of a sequential transfer

- Option field values are defined through I2C_XFEROPTIONS and are listed below:
  - I2C_FIRST_AND_LAST_FRAME: No sequential usage, functional is same as associated interfaces in no sequential mode
  - I2C_FIRST_FRAME: Sequential usage, this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition
  - I2C_FIRST_AND_NEXT_FRAME: Sequential usage (Master only), this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition, an then permit a call the same master sequential interface several times (like HAL_I2C_Master_Seq_Transmit_IT() then HAL_I2C_Master_Seq_Transmit_IT() or HAL_I2C_Master_Seq_Transmit_DMA() then HAL_I2C_Master_Seq_Transmit_DMA())
  - I2C_NEXT_FRAME: Sequential usage, this option allow to manage a sequence with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and without a final stop condition in both cases
  - I2C_LAST_FRAME: Sequential usage, this option allow to manage a sequance with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and with a final stop condition in both cases
  - I2C_LAST_FRAME_NO_STOP: Sequential usage (Master only), this option allow to manage a restart condition after several call of the same master sequential interface several times (link with option I2C_FIRST_AND_NEXT_FRAME). Usage can, transfer several bytes one by one using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_AND_NEXT_FRAME then I2C_NEXT_FRAME. Then usage of this option I2C_LAST_FRAME_NO_STOP at the last Transmit or Receive sequence permit to call the opposite interface Receive or Transmit without stopping the communication and so generate a restart condition.
  - I2C_OTHER_FRAME: Sequential usage (Master only), this option allow to manage a restart condition after each call of the same master sequential interface. Usage can, transfer several bytes one by one with a restart with slave address between each bytes using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_FRAME then I2C_OTHER_FRAME. Then usage of this option I2C_OTHER_AND_LAST_FRAME at the last frame to help automatic generation of STOP condition.

- Different sequential I2C interfaces are listed below:
  - Sequential transmit in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Transmit_IT() or using HAL_I2C_Master_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
  - Sequential receive in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Receive_IT() or using HAL_I2C_Master_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
  - Abort a master IT or DMA I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
    - End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
  - Enable/disable the Address listen mode in slave I2C mode using HAL_I2C_EnableListen_IT() HAL_I2C_DisableListen_IT()
    - When address slave I2C match, HAL_I2C_AddrCallback() is executed and users can add their own code to check the Address Match Code and the transmission direction request by master (Write/Read).
    - At Listen mode end HAL_I2C_ListenCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_ListenCpltCallback()
  - Sequential transmit in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Transmit_IT() or using HAL_I2C_Slave_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
  - Sequential receive in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Receive_IT() or using HAL_I2C_Slave_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
  - In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
  - Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode IO MEM operation

- Write an amount of data in non-blocking mode with Interrupt to a specific memory address using HAL_I2C_Mem_Write_IT()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with Interrupt from a specific memory address using HAL_I2C_Mem_Read_IT()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

DMA mode IO operation

- Transmit in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()

- Receive in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Receive_DMA()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Receive_DMA()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

DMA mode IO MEM operation

- Write an amount of data in non-blocking mode with DMA to a specific memory address using HAL_I2C_Mem_Write_DMA()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with DMA from a specific memory address using HAL_I2C_Mem_Read_DMA()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

I2C HAL driver macros list

Below the list of most used macros in I2C HAL driver.

- __HAL_I2C_ENABLE: Enable the I2C peripheral
- __HAL_I2C_DISABLE: Disable the I2C peripheral
- __HAL_I2C_GENERATE_NACK: Generate a Non-Acknowledge I2C peripheral in Slave mode
- __HAL_I2C_GET_FLAG: Check whether the specified I2C flag is set or not
- __HAL_I2C_CLEAR_FLAG: Clear the specified I2C pending flag
- __HAL_I2C_ENABLE_IT: Enable the specified I2C interrupt
- __HAL_I2C_DISABLE_IT: Disable the specified I2C interrupt

Callback registration

The compilation flag USE_HAL_I2C_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2C_RegisterCallback() or HAL_I2C_RegisterAddrCallback() to register an interrupt callback.

Function HAL_I2C_RegisterCallback() allows to register following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.

- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback AddrCallback use dedicated register callbacks : HAL_I2C_RegisterAddrCallback().

Use function HAL_I2C_UnRegisterCallback to reset a callback to the default weak function. HAL_I2C_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.
- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

For callback AddrCallback use dedicated register callbacks : HAL_I2C_UnRegisterAddrCallback().

By default, after the HAL_I2C_Init() and when the state is HAL_I2C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2C_MasterTxCpltCallback(), HAL_I2C_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2C_Init()/ HAL_I2C_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2C_Init()/ HAL_I2C_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I2C_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I2C_STATE_READY or HAL_I2C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2C_RegisterCallback() before calling HAL_I2C_DeInit() or HAL_I2C_Init() function.

When the compilation flag USE_HAL_I2C_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the I2C HAL driver header file for more useful macros

36.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the I2Cx peripheral:

- User must Implement HAL_I2C_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_I2C_Init() to configure the selected device with the selected configuration:
  - Clock Timing
  - Own Address 1
  - Addressing mode (Master, Slave)
  - Dual Addressing mode
  - Own Address 2
  - Own Address 2 Mask
  - General call mode
  - Nostretch mode
- Call the function HAL_I2C_DeInit() to restore the default configuration of the selected I2Cx peripheral.

This section contains the following APIs:

- *HAL_I2C_Init()*
- *HAL_I2C_DeInit()*
- *HAL_I2C_MspInit()*
- *HAL_I2C_MspDeInit()*
- *HAL_I2C_RegisterCallback()*
- *HAL_I2C_UnRegisterCallback()*
- *HAL_I2C_RegisterAddrCallback()*
- *HAL_I2C_UnRegisterAddrCallback()*

36.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2C data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2C IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
   - HAL_I2C_Master_Transmit()
   - HAL_I2C_Master_Receive()
   - HAL_I2C_Slave_Transmit()
   - HAL_I2C_Slave_Receive()
   - HAL_I2C_Mem_Write()
   - HAL_I2C_Mem_Read()
   - HAL_I2C_IsDeviceReady()
3. No-Blocking mode functions with Interrupt are :
   - HAL_I2C_Master_Transmit_IT()
   - HAL_I2C_Master_Receive_IT()
   - HAL_I2C_Slave_Transmit_IT()
   - HAL_I2C_Slave_Receive_IT()
   - HAL_I2C_Mem_Write_IT()
   - HAL_I2C_Mem_Read_IT()
   - HAL_I2C_Master_Seq_Transmit_IT()
   - HAL_I2C_Master_Seq_Receive_IT()
   - HAL_I2C_Slave_Seq_Transmit_IT()
   - HAL_I2C_Slave_Seq_Receive_IT()
   - HAL_I2C_EnableListen_IT()
   - HAL_I2C_DisableListen_IT()
   - HAL_I2C_Master_Abort_IT()
4. No-Blocking mode functions with DMA are :
   - HAL_I2C_Master_Transmit_DMA()
   - HAL_I2C_Master_Receive_DMA()
   - HAL_I2C_Slave_Transmit_DMA()
   - HAL_I2C_Slave_Receive_DMA()
   - HAL_I2C_Mem_Write_DMA()
   - HAL_I2C_Mem_Read_DMA()
   - HAL_I2C_Master_Seq_Transmit_DMA()
   - HAL_I2C_Master_Seq_Receive_DMA()
   - HAL_I2C_Slave_Seq_Transmit_DMA()
   - HAL_I2C_Slave_Seq_Receive_DMA()

5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   - HAL_I2C_MasterTxCpltCallback()
   - HAL_I2C_MasterRxCpltCallback()
   - HAL_I2C_SlaveTxCpltCallback()
   - HAL_I2C_SlaveRxCpltCallback()
   - HAL_I2C_MemTxCpltCallback()
   - HAL_I2C_MemRxCpltCallback()
   - HAL_I2C_AddrCallback()
   - HAL_I2C_ListenCpltCallback()
   - HAL_I2C_ErrorCallback()
   - HAL_I2C_AbortCpltCallback()

This section contains the following APIs:

- ***HAL_I2C_Master_Transmit()***
- ***HAL_I2C_Master_Receive()***
- ***HAL_I2C_Slave_Transmit()***
- ***HAL_I2C_Slave_Receive()***
- ***HAL_I2C_Master_Transmit_IT()***
- ***HAL_I2C_Master_Receive_IT()***
- ***HAL_I2C_Slave_Transmit_IT()***
- ***HAL_I2C_Slave_Receive_IT()***
- ***HAL_I2C_Master_Transmit_DMA()***
- ***HAL_I2C_Master_Receive_DMA()***
- ***HAL_I2C_Slave_Transmit_DMA()***
- ***HAL_I2C_Slave_Receive_DMA()***
- ***HAL_I2C_Mem_Write()***
- ***HAL_I2C_Mem_Read()***
- ***HAL_I2C_Mem_Write_IT()***
- ***HAL_I2C_Mem_Read_IT()***
- ***HAL_I2C_Mem_Write_DMA()***
- ***HAL_I2C_Mem_Read_DMA()***
- ***HAL_I2C_IsDeviceReady()***
- ***HAL_I2C_Master_Seq_Transmit_IT()***
- ***HAL_I2C_Master_Seq_Transmit_DMA()***
- ***HAL_I2C_Master_Seq_Receive_IT()***
- ***HAL_I2C_Master_Seq_Receive_DMA()***
- ***HAL_I2C_Slave_Seq_Transmit_IT()***
- ***HAL_I2C_Slave_Seq_Transmit_DMA()***
- ***HAL_I2C_Slave_Seq_Receive_IT()***
- ***HAL_I2C_Slave_Seq_Receive_DMA()***
- ***HAL_I2C_EnableListen_IT()***
- ***HAL_I2C_DisableListen_IT()***
- ***HAL_I2C_Master_Abort_IT()***

36.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- ***HAL_I2C_GetState()***
- ***HAL_I2C_GetMode()***
- ***HAL_I2C_GetError()***

36.2.5 Detailed description of functions

HAL_I2C_Init

Function name

HAL_StatusTypeDef HAL_I2C_Init (I2C_HandleTypeDef * hi2c)

Function description

Initializes the I2C according to the specified parameters in the I2C_InitTypeDef and initialize the associated handle.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_DeInit

Function name

HAL_StatusTypeDef HAL_I2C_DeInit (I2C_HandleTypeDef * hi2c)

Function description

DeInitialize the I2C peripheral.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_MspInit

Function name

void HAL_I2C_MspInit (I2C_HandleTypeDef * hi2c)

Function description

Initialize the I2C MSP.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MspDeInit

Function name

void HAL_I2C_MspDeInit (I2C_HandleTypeDef * hi2c)

Function description

DeInitialize the I2C MSP.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I2C_RegisterCallback (I2C_HandleTypeDef * hi2c, HAL_I2C_CallbackIDTypeDef CallbackID, pI2C_CallbackTypeDef pCallback)

Function description

Register a User I2C Callback To be used instead of the weak predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_I2C_MASTER_TX_COMPLETE_CB_ID Master Tx Transfer completed callback ID
  - HAL_I2C_MASTER_RX_COMPLETE_CB_ID Master Rx Transfer completed callback ID
  - HAL_I2C_SLAVE_TX_COMPLETE_CB_ID Slave Tx Transfer completed callback ID
  - HAL_I2C_SLAVE_RX_COMPLETE_CB_ID Slave Rx Transfer completed callback ID
  - HAL_I2C_LISTEN_COMPLETE_CB_ID Listen Complete callback ID
  - HAL_I2C_MEM_TX_COMPLETE_CB_ID Memory Tx Transfer callback ID
  - HAL_I2C_MEM_RX_COMPLETE_CB_ID Memory Rx Transfer completed callback ID
  - HAL_I2C_ERROR_CB_ID Error callback ID
  - HAL_I2C_ABORT_CB_ID Abort callback ID
  - HAL_I2C_MSPINIT_CB_ID MspInit callback ID
  - HAL_I2C_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_I2C_RegisterCallback() may be called before HAL_I2C_Init() in HAL_I2C_STATE_RESET to register callbacks for HAL_I2C_MSPINIT_CB_ID and HAL_I2C_MSPDEINIT_CB_ID.

HAL_I2C_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I2C_UnRegisterCallback (I2C_HandleTypeDef * hi2c, HAL_I2C_CallbackIDTypeDef CallbackID)

Function description

Unregister an I2C Callback I2C callback is redirected to the weak predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values: This parameter can be one of the following values:
  - HAL_I2C_MASTER_TX_COMPLETE_CB_ID Master Tx Transfer completed callback ID
  - HAL_I2C_MASTER_RX_COMPLETE_CB_ID Master Rx Transfer completed callback ID
  - HAL_I2C_SLAVE_TX_COMPLETE_CB_ID Slave Tx Transfer completed callback ID
  - HAL_I2C_SLAVE_RX_COMPLETE_CB_ID Slave Rx Transfer completed callback ID
  - HAL_I2C_LISTEN_COMPLETE_CB_ID Listen Complete callback ID
  - HAL_I2C_MEM_TX_COMPLETE_CB_ID Memory Tx Transfer callback ID
  - HAL_I2C_MEM_RX_COMPLETE_CB_ID Memory Rx Transfer completed callback ID
  - HAL_I2C_ERROR_CB_ID Error callback ID
  - HAL_I2C_ABORT_CB_ID Abort callback ID
  - HAL_I2C_MSPINIT_CB_ID MspInit callback ID
  - HAL_I2C_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

Notes

- The HAL_I2C_UnRegisterCallback() may be called before HAL_I2C_Init() in HAL_I2C_STATE_RESET to un-register callbacks for HAL_I2C_MSPINIT_CB_ID and HAL_I2C_MSPDEINIT_CB_ID.

HAL_I2C_RegisterAddrCallback

Function name

HAL_StatusTypeDef HAL_I2C_RegisterAddrCallback (I2C_HandleTypeDef * hi2c, pI2C_AddrCallbackTypeDef pCallback)

Function description

Register the Slave Address Match I2C Callback To be used instead of the weak HAL_I2C_AddrCallback() predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pCallback:** pointer to the Address Match Callback function

Return values

- **HAL:** status

HAL_I2C_UnRegisterAddrCallback

Function name

HAL_StatusTypeDef HAL_I2C_UnRegisterAddrCallback (I2C_HandleTypeDef * hi2c)

Function description

UnRegister the Slave Address Match I2C Callback Info Ready I2C Callback is redirected to the weak HAL_I2C_AddrCallback() predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_Master_Transmit

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmits in master mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Master_Receive

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receives in master mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmits in slave mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Slave_Receive

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive in slave mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Mem_Write

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Write an amount of data in blocking mode to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Mem_Read

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Read an amount of data in blocking mode from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_IsDeviceReady

Function name

HAL_StatusTypeDef HAL_I2C_IsDeviceReady (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint32_t Trials, uint32_t Timeout)

Function description

Checks if target device is ready for communication.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **Trials:** Number of trials
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- This function is used with Memory devices

HAL_I2C_Master_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Transmit in master mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Receive in master mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Transmit in slave mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Receive in slave mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Write_IT

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Write an amount of data in non-blocking mode with Interrupt to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Read_IT

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Read an amount of data in non-blocking mode with Interrupt from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Seq_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Transmit_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in master I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Master_Seq_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Receive_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in master I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Transmit_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in slave/device I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Receive_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in slave/device I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_EnableListen_IT

Function name

HAL_StatusTypeDef HAL_I2C_EnableListen_IT (I2C_HandleTypeDef * hi2c)

Function description

Enable the Address listen mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_DisableListen_IT

Function name

HAL_StatusTypeDef HAL_I2C_DisableListen_IT (I2C_HandleTypeDef * hi2c)

Function description

Disable the Address listen mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C

Return values

- **HAL:** status

HAL_I2C_Master_Abort_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Abort_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress)

Function description

Abort a master I2C IT or DMA process communication with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface

Return values

- **HAL:** status

HAL_I2C_Master_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Transmit in master mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Receive in master mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Transmit in slave mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Receive in slave mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Write_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Write an amount of data in non-blocking mode with DMA to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Read_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Reads an amount of data in non-blocking mode with DMA from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be read

Return values

- **HAL:** status

HAL_I2C_Master_Seq_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in master I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Master_Seq_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Receive_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in master I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in slave/device I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Receive_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in slave/device I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_EV_IRQHandler

Function name

void HAL_I2C_EV_IRQHandler (I2C_HandleTypeDef * hi2c)

Function description

This function handles I2C event interrupt request.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_ER_IRQHandler

Function name

void HAL_I2C_ER_IRQHandler (I2C_HandleTypeDef * hi2c)

Function description

This function handles I2C error interrupt request.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MasterTxCpltCallback

Function name

void HAL_I2C_MasterTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Master Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MasterRxCpltCallback

Function name

void HAL_I2C_MasterRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Master Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_SlaveTxCpltCallback

Function name

void HAL_I2C_SlaveTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Slave Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_SlaveRxCpltCallback

Function name

void HAL_I2C_SlaveRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Slave Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_AddrCallback

Function name

void HAL_I2C_AddrCallback (I2C_HandleTypeDef * hi2c, uint8_t TransferDirection, uint16_t AddrMatchCode)

Function description

Slave Address Match callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **TransferDirection:** Master request Transfer Direction (Write/Read), value of I2C Transfer Direction Master Point of View
- **AddrMatchCode:** Address Match Code

Return values

- **None:**

HAL_I2C_ListenCpltCallback

Function name

void HAL_I2C_ListenCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Listen Complete callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MemTxCpltCallback

Function name

void HAL_I2C_MemTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Memory Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MemRxCpltCallback

Function name

void HAL_I2C_MemRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Memory Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_ErrorCallback

Function name

void HAL_I2C_ErrorCallback (I2C_HandleTypeDef * hi2c)

Function description

I2C error callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_AbortCpltCallback

Function name

void HAL_I2C_AbortCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

I2C abort callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_GetState

Function name

HAL_I2C_StateTypeDef HAL_I2C_GetState (const I2C_HandleTypeDef * hi2c)

Function description

Return the I2C handle state.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** state

HAL_I2C_GetMode

Function name

HAL_I2C_ModeTypeDef HAL_I2C_GetMode (const I2C_HandleTypeDef * hi2c)

Function description

Returns the I2C Master, Slave, Memory or no mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for I2C module

Return values

- **HAL:** mode

HAL_I2C_GetError

Function name

uint32_t HAL_I2C_GetError (const I2C_HandleTypeDef * hi2c)

Function description

Return the I2C error code.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **I2C:** Error Code

36.3 I2C Firmware driver defines

The following section lists the various define and macros of the module.

36.3.1 I2C

I2C

I2C Addressing Mode

I2C_ADDRESSINGMODE_7BIT

I2C_ADDRESSINGMODE_10BIT

I2C Dual Addressing Mode

I2C_DUALADDRESS_DISABLE

I2C_DUALADDRESS_ENABLE

I2C Error Code definition

HAL_I2C_ERROR_NONE

No error

HAL_I2C_ERROR_BERR

BERR error

HAL_I2C_ERROR_ARLO

ARLO error

HAL_I2C_ERROR_AF

ACKF error

HAL_I2C_ERROR_OVR

OVR error

HAL_I2C_ERROR_DMA

DMA transfer error

HAL_I2C_ERROR_TIMEOUT

Timeout error

HAL_I2C_ERROR_SIZE

Size Management error

HAL_I2C_ERROR_DMA_PARAM

DMA Parameter Error

HAL_I2C_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_I2C_ERROR_INVALID_PARAM

Invalid Parameters error

I2C Exported Macros

__HAL_I2C_RESET_HANDLE_STATE

Description:

- Reset I2C handle state.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_ENABLE_IT

Description:

- Enable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_DISABLE_IT

Description:

- Disable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_GET_IT_SOURCE

Description:

- Check whether the specified I2C interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the I2C interrupt source to check. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

I2C_FLAG_MASK

Description:

- Check whether the specified I2C flag is set or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_TXIS Transmit interrupt status
  - I2C_FLAG_RXNE Receive data register not empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_TC Transfer complete (master mode)
  - I2C_FLAG_TCR Transfer complete reload
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert
  - I2C_FLAG_BUSY Bus busy
  - I2C_FLAG_DIR Transfer direction (slave mode)

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_I2C_GET_FLAG

__HAL_I2C_CLEAR_FLAG

Description:

- Clear the I2C pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert

Return value:

- None

__HAL_I2C_ENABLE

Description:

- Enable the specified I2C peripheral.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_DISABLE

Description:

- Disable the specified I2C peripheral.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_GENERATE_NACK

Description:

- Generate a Non-Acknowledge I2C peripheral in Slave mode.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

37 HAL I2C Extension Driver

37.1 I2CEx Firmware driver API description

The following section lists the various functions of the I2CEx library.

37.1.1 I2C peripheral Extended features

Comparing to other previous devices, the I2C interface for STM32H5xx devices contains the following additional features

- Possibility to disable or enable Analog Noise Filter
- Use of a configured Digital Noise Filter
- Disable or enable wakeup from Stop mode(s)
- Disable or enable Fast Mode Plus

37.1.2 How to use this driver

This driver provides functions to configure Noise Filter and Wake Up Feature

1. Configure I2C Analog noise filter using the function HAL_I2CEx_ConfigAnalogFilter()
2. Configure I2C Digital noise filter using the function HAL_I2CEx_ConfigDigitalFilter()
3. Configure the enable or disable of I2C Wake Up Mode using the functions :
   - HAL_I2CEx_EnableWakeUp()
   - HAL_I2CEx_DisableWakeUp()
4. Configure the enable or disable of fast mode plus driving capability using the functions :
   - HAL_I2CEx_ConfigFastModePlus()

37.1.3 Filter Mode Functions

This section provides functions allowing to:

- Configure Noise Filters

This section contains the following APIs:

- ***HAL_I2CEx_ConfigAnalogFilter()***
- ***HAL_I2CEx_ConfigDigitalFilter()***

37.1.4 WakeUp Mode Functions

This section provides functions allowing to:

- Configure Wake Up Feature

This section contains the following APIs:

- ***HAL_I2CEx_EnableWakeUp()***
- ***HAL_I2CEx_DisableWakeUp()***

37.1.5 Fast Mode Plus Functions

This section provides functions allowing to:

- Configure Fast Mode Plus

This section contains the following APIs:

- ***HAL_I2CEx_ConfigFastModePlus()***

37.1.6 Detailed description of functions

HAL_I2CEx_ConfigAnalogFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigAnalogFilter (I2C_HandleTypeDef * hi2c, uint32_t AnalogFilter)

Function description

Configure I2C Analog noise filter.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **AnalogFilter:** New state of the Analog filter.

Return values

- **HAL:** status

HAL_I2CEx_ConfigDigitalFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigDigitalFilter (I2C_HandleTypeDef * hi2c, uint32_t DigitalFilter)

Function description

Configure I2C Digital noise filter.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **DigitalFilter:** Coefficient of digital noise filter between Min_Data=0x00 and Max_Data=0x0F.

Return values

- **HAL:** status

HAL_I2CEx_EnableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_EnableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

Enable I2C wakeup from Stop mode(s).

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_DisableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_DisableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

Disable I2C wakeup from Stop mode(s).

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_ConfigFastModePlus

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigFastModePlus (I2C_HandleTypeDef * hi2c, uint32_t FastModePlus)

Function description

Configure I2C Fast Mode Plus.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **FastModePlus:** New state of the Fast Mode Plus.

Return values

- **HAL:** status

37.2 I2CEx Firmware driver defines

The following section lists the various define and macros of the module.

37.2.1 I2CEx

I2CEx

I2C Extended Analog Filter

I2C_ANALOGFILTER_ENABLE

I2C_ANALOGFILTER_DISABLE

I2C Extended Fast Mode Plus

I2C_FASTMODEPLUS_ENABLE

Enable Fast Mode Plus

I2C_FASTMODEPLUS_DISABLE

Disable Fast Mode Plus

38 HAL I2S Generic Driver

38.1 I2S Firmware driver registers structures

38.1.1 I2S_InitTypeDef

I2S_InitTypeDef is defined in the stm32h5xx_hal_i2s.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t Standard***
- ***uint32_t DataFormat***
- ***uint32_t MCLKOutput***
- ***uint32_t AudioFreq***
- ***uint32_t CPOL***
- ***uint32_t FirstBit***
- ***uint32_t WSInversion***
- ***uint32_t Data24BitAlignment***
- ***uint32_t MasterKeepIOState***

Field Documentation

- ***uint32_t I2S_InitTypeDef::Mode***
  Specifies the I2S operating mode. This parameter can be a value of ***I2S_Mode***
- ***uint32_t I2S_InitTypeDef::Standard***
  Specifies the standard used for the I2S communication. This parameter can be a value of ***I2S_Standard***
- ***uint32_t I2S_InitTypeDef::DataFormat***
  Specifies the data format for the I2S communication. This parameter can be a value of ***I2S_Data_Format***
- ***uint32_t I2S_InitTypeDef::MCLKOutput***
  Specifies whether the I2S MCLK output is enabled or not. This parameter can be a value of ***I2S_MCLK_Output***
- ***uint32_t I2S_InitTypeDef::AudioFreq***
  Specifies the frequency selected for the I2S communication. This parameter can be a value of ***I2S_Audio_Frequency***
- ***uint32_t I2S_InitTypeDef::CPOL***
  Specifies the idle state of the I2S clock. This parameter can be a value of ***I2S_Clock_Polarity***
- ***uint32_t I2S_InitTypeDef::FirstBit***
  Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of ***I2S_MSB_LSB_Transmission***
- ***uint32_t I2S_InitTypeDef::WSInversion***
  Control the Word Select Inversion. This parameter can be a value of ***I2S_WSInversion***
- ***uint32_t I2S_InitTypeDef::Data24BitAlignment***
  Specifies the Data Padding for 24 bits data length This parameter can be a value of ***I2S_Data_24Bit_Alignment***
- ***uint32_t I2S_InitTypeDef::MasterKeepIOState***
  Control of Alternate function GPIOs state This parameter can be a value of ***I2S_Master_Keep_IO_State***

38.1.2 __I2S_HandleTypeDef

__I2S_HandleTypeDef is defined in the stm32h5xx_hal_i2s.h

Data Fields

  I2S Msp Init callback
- ***void(* __I2S_HandleTypeDef::MspDeInitCallback)(struct __I2S_HandleTypeDef *hi2s)***
  I2S Msp DeInit callback

38.2 I2S Firmware driver API description

The following section lists the various functions of the I2S library.

38.2.1 How to use this driver

The I2S HAL driver can be used as follow:

1. Declare a I2S_HandleTypeDef handle structure.
2. Initialize the I2S low level resources by implement the HAL_I2S_MspInit() API:
   a. Enable the SPIx interface clock.
   b. I2S pins configuration:
      - Enable the clock for the I2S GPIOs.
      - Configure these I2S pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_I2S_Transmit_IT() and HAL_I2S_Receive_IT() APIs).
      - Configure the I2Sx interrupt priority.
      - Enable the NVIC I2S IRQ handle.
   d. DMA Configuration if you need to use DMA process (HAL_I2S_Transmit_DMA() and HAL_I2S_Receive_DMA() APIs:
      - Declare a DMA handle structure for the Tx/Rx Stream/Channel.
      - Enable the DMAx interface clock.
      - Configure the declared DMA handle structure with the required Tx/Rx parameters.
      - Configure the DMA Tx/Rx Stream/Channel.
      - Associate the initialized DMA handle to the I2S DMA Tx/Rx handle.
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx Stream/Channel.
3. Program the Mode, Standard, Data Format, MCLK Output, Audio frequency and Polarity using HAL_I2S_Init() function.

Note: The specific I2S interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_I2S_ENABLE_IT() and __HAL_I2S_DISABLE_IT() inside the transmit and receive process.

– *External clock source is configured after setting correctly the define constant EXTERNAL_CLOCK_VALUE in the stm32h5xx_hal_conf.h file.*

4. Three mode of operations are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_I2S_Transmit()

- Receive an amount of data in blocking mode using HAL_I2S_Receive()

Interrupt mode IO operation

- Send an amount of data in non blocking mode using HAL_I2S_Transmit_IT()
- At transmission end of half transfer HAL_I2S_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxHalfCpltCallback
- At transmission end of transfer HAL_I2S_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxCpltCallback
- Receive an amount of data in non blocking mode using HAL_I2S_Receive_IT()
- At reception end of half transfer HAL_I2S_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxHalfCpltCallback
- At reception end of transfer HAL_I2S_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxCpltCallback
- In case of transfer Error, HAL_I2S_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2S_ErrorCallback

DMA mode IO operation

- Send an amount of data in non blocking mode (DMA) using HAL_I2S_Transmit_DMA()
- At transmission end of half transfer HAL_I2S_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxHalfCpltCallback
- At transmission end of transfer HAL_I2S_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxCpltCallback
- Receive an amount of data in non blocking mode (DMA) using HAL_I2S_Receive_DMA()
- At reception end of half transfer HAL_I2S_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxHalfCpltCallback
- At reception end of transfer HAL_I2S_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxCpltCallback
- In case of transfer Error, HAL_I2S_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2S_ErrorCallback
- Pause the DMA Transfer using HAL_I2S_DMAPause()
- Resume the DMA Transfer using HAL_I2S_DMAResume()
- Stop the DMA Transfer using HAL_I2S_DMAStop()

I2S HAL driver macros list

Below the list of most used macros in I2S HAL driver.

- __HAL_I2S_ENABLE: Enable the specified SPI peripheral (in I2S mode)
- __HAL_I2S_DISABLE: Disable the specified SPI peripheral (in I2S mode)
- __HAL_I2S_ENABLE_IT : Enable the specified I2S interrupts
- __HAL_I2S_DISABLE_IT : Disable the specified I2S interrupts
- __HAL_I2S_GET_FLAG: Check whether the specified I2S flag is set or not

Note: You can refer to the I2S HAL driver header file for more useful macros

I2S HAL driver macros list

Callback registration:

1. The compilation flag USE_HAL_I2S_REGISTER_CALLBACKS when set to 1UL allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2S_RegisterCallback() to register an interrupt callback. Function HAL_I2S_RegisterCallback() allows to register following callbacks: (+) TxCpltCallback : I2S Tx Completed callback (+) RxCpltCallback : I2S Rx Completed callback (+) TxRxCpltCallback : I2S TxRx Completed callback (+) TxHalfCpltCallback : I2S Tx Half Completed callback (+) RxHalfCpltCallback : I2S Rx Half Completed callback (+) TxRxHalfCpltCallback : I2S TxRx Half Completed callback (+) ErrorCallback : I2S Error callback (+) MspInitCallback : I2S Msp Init callback (+) MspDeInitCallback : I2S Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

2. Use function HAL_I2S_UnRegisterCallback to reset a callback to the default weak function. HAL_I2S_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) TxCpltCallback : I2S Tx Completed callback (+) RxCpltCallback : I2S Rx Completed callback (+) TxRxCpltCallback : I2S TxRx Completed callback (+) TxHalfCpltCallback : I2S Tx Half Completed callback (+) RxHalfCpltCallback : I2S Rx Half Completed callback (+) TxRxHalfCpltCallback : I2S TxRx Half Completed callback (+) ErrorCallback : I2S Error callback (+) MspInitCallback : I2S Msp Init callback (+) MspDeInitCallback : I2S Msp DeInit callback By default, after the HAL_I2S_Init() and when the state is HAL_I2S_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2S_MasterTxCpltCallback(), HAL_I2S_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2S_Init()/ HAL_I2S_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2S_Init()/ HAL_I2S_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state. Callbacks can be registered/unregistered in HAL_I2S_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_I2S_STATE_READY or HAL_I2S_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2S_RegisterCallback() before calling HAL_I2S_DeInit() or HAL_I2S_Init() function. When The compilation define USE_HAL_I2S_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

Callback registration: (#) The compilation flag USE_HAL_I2S_REGISTER_CALLBACKS when set to 1UL allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2S_RegisterCallback() to register an interrupt callback. Function HAL_I2S_RegisterCallback() allows to register following callbacks:

- TxCpltCallback : I2S Tx Completed callback
- RxCpltCallback : I2S Rx Completed callback
- TxRxCpltCallback : I2S TxRx Completed callback
- TxHalfCpltCallback : I2S Tx Half Completed callback
- RxHalfCpltCallback : I2S Rx Half Completed callback
- TxRxHalfCpltCallback : I2S TxRx Half Completed callback
- ErrorCallback : I2S Error callback
- MspInitCallback : I2S Msp Init callback
- MspDeInitCallback : I2S Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function HAL_I2S_UnRegisterCallback to reset a callback to the default weak function. HAL_I2S_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- TxCpltCallback : I2S Tx Completed callback
- RxCpltCallback : I2S Rx Completed callback
- TxRxCpltCallback : I2S TxRx Completed callback
- TxHalfCpltCallback : I2S Tx Half Completed callback
- RxHalfCpltCallback : I2S Rx Half Completed callback
- TxRxHalfCpltCallback : I2S TxRx Half Completed callback
- ErrorCallback : I2S Error callback
- MspInitCallback : I2S Msp Init callback
- MspDeInitCallback : I2S Msp DeInit callback By default, after the HAL_I2S_Init() and when the state is HAL_I2S_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2S_MasterTxCpltCallback(), HAL_I2S_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2S_Init()/ HAL_I2S_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2S_Init()/ HAL_I2S_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state. Callbacks can be registered/unregistered in HAL_I2S_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in HAL_I2S_STATE_READY or HAL_I2S_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2S_RegisterCallback() before calling HAL_I2S_DeInit() or HAL_I2S_Init() function. When The compilation define USE_HAL_I2S_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

38.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and de-initialize the I2Sx peripheral in simplex mode:

- User must Implement HAL_I2S_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_I2S_Init() to configure the selected device with the selected configuration:
  - Mode
  - Standard
  - Data Format
  - MCLK Output
  - Audio frequency
  - Polarity
- Call the function HAL_I2S_DeInit() to restore the default configuration of the selected I2Sx peripheral.

This section contains the following APIs:

- ***HAL_I2S_Init()***
- ***HAL_I2S_DeInit()***
- ***HAL_I2S_MspInit()***
- ***HAL_I2S_MspDeInit()***
- ***HAL_I2S_RegisterCallback()***
- ***HAL_I2S_UnRegisterCallback()***

38.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2S data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2S IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
   - HAL_I2S_Transmit()
   - HAL_I2S_Receive()
   - HAL_I2SEx_TransmitReceive()
3. No-Blocking mode functions with Interrupt are :
   - HAL_I2S_Transmit_IT()
   - HAL_I2S_Receive_IT()
   - HAL_I2SEx_TransmitReceive_IT()
4. No-Blocking mode functions with DMA are :
   - HAL_I2S_Transmit_DMA()
   - HAL_I2S_Receive_DMA()
   - HAL_I2SEx_TransmitReceive_DMA()
5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   - HAL_I2S_TxCpltCallback()
   - HAL_I2S_RxCpltCallback()
   - HAL_I2SEx_TxRxCpltCallback()
   - HAL_I2S_ErrorCallback()

This section contains the following APIs:

- ***HAL_I2S_Transmit()***
- ***HAL_I2S_Receive()***
- ***HAL_I2SEx_TransmitReceive()***

38.2.4 Peripheral State and Errors functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_I2S_GetState()*
- *HAL_I2S_GetError()*

38.2.5 Detailed description of functions

HAL_I2S_Init

Function name

HAL_StatusTypeDef HAL_I2S_Init (I2S_HandleTypeDef * hi2s)

Function description

Initializes the I2S according to the specified parameters in the I2S_InitTypeDef and create the associated handle.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_DeInit

Function name

HAL_StatusTypeDef HAL_I2S_DeInit (I2S_HandleTypeDef * hi2s)

Function description

DeInitializes the I2S peripheral.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_MspInit

Function name

void HAL_I2S_MspInit (I2S_HandleTypeDef * hi2s)

Function description

I2S MSP Init.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_MspDeInit

Function name

void HAL_I2S_MspDeInit (I2S_HandleTypeDef * hi2s)

Function description

I2S MSP DeInit.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I2S_RegisterCallback (I2S_HandleTypeDef * hi2s, HAL_I2S_CallbackIDTypeDef CallbackID, pI2S_CallbackTypeDef pCallback)

Function description

Register a User I2S Callback To be used instead of the weak predefined callback.

Parameters

- **hi2s:** Pointer to a I2S_HandleTypeDef structure that contains the configuration information for the specified I2S.
- **CallbackID:** ID of the callback to be registered
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_I2S_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I2S_UnRegisterCallback (I2S_HandleTypeDef * hi2s, HAL_I2S_CallbackIDTypeDef CallbackID)

Function description

Unregister an I2S Callback I2S callback is redirected to the weak predefined callback.

Parameters

- **hi2s:** Pointer to a I2S_HandleTypeDef structure that contains the configuration information for the specified I2S.
- **CallbackID:** ID of the callback to be unregistered

Return values

- **HAL:** status

HAL_I2S_Transmit

Function name

HAL_StatusTypeDef HAL_I2S_Transmit (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmit an amount of data in blocking mode.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to data buffer.
- **Size:** number of data sample to be sent:
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Receive

Function name

HAL_StatusTypeDef HAL_I2S_Receive (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to data buffer.
- **Size:** number of data sample to be sent:
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).
- In I2S Master Receiver mode, just after enabling the peripheral the clock will be generate in continuous way and as the I2S is not disabled at the end of the I2S transaction.

HAL_I2SEx_TransmitReceive

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size, uint32_t Timeout)

Function description

Full-Duplex Transmit/Receive data in blocking mode.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pTxData:** a 16-bit pointer to the Transmit data buffer.
- **pRxData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2S_Transmit_IT (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size)

Function description

Transmit an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2S_Receive_IT (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)

Function description

Receive an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).
- It is recommended to use DMA for the I2S receiver to avoid de-synchronization between Master and Slave otherwise the I2S interrupt should be optimized.

HAL_I2SEx_TransmitReceive_IT

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive_IT (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)

Function description

Full-Duplex Transmit/Receive data in non-blocking mode using Interrupt.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pTxData:** a 16-bit pointer to the Transmit data buffer.
- **pRxData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_IRQHandler

Function name

void HAL_I2S_IRQHandler (I2S_HandleTypeDef * hi2s)

Function description

This function handles I2S interrupt request.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2S_Transmit_DMA (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size)

Function description

Transmit an amount of data in non-blocking mode with DMA.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to the Transmit data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2S_Receive_DMA (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2SEx_TransmitReceive_DMA

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive_DMA (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)

Function description

Full-Duplex Transmit/Receive data in non-blocking mode using DMA.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module
- **pTxData:** a 16-bit pointer to the Transmit data buffer.
- **pRxData:** a 16-bit pointer to the Receive data buffer.
- **Size:** number of data sample to be sent:

Return values

- **HAL:** status

Notes

- When a 16-bit data frame or a 16-bit data frame extended is selected during the I2S configuration phase, the Size parameter means the number of 16-bit data length in the transaction and when a 24-bit data frame or a 32-bit data frame is selected the Size parameter means the number of 16-bit data length.
- The I2S is kept enabled at the end of transaction to avoid the clock de-synchronization between Master and Slave(example: audio streaming).

HAL_I2S_DMAPause

Function name

HAL_StatusTypeDef HAL_I2S_DMAPause (I2S_HandleTypeDef * hi2s)

Function description

Pauses the audio DMA Stream/Channel playing from the Media.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_DMAResume

Function name

HAL_StatusTypeDef HAL_I2S_DMAResume (I2S_HandleTypeDef * hi2s)

Function description

Resumes the audio DMA Stream/Channel playing from the Media.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_DMAStop

Function name

HAL_StatusTypeDef HAL_I2S_DMAStop (I2S_HandleTypeDef * hi2s)

Function description

Stops the audio DMA Stream/Channel playing from the Media.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** status

HAL_I2S_TxHalfCpltCallback

Function name

void HAL_I2S_TxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Tx Transfer Half completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_TxCpltCallback

Function name

void HAL_I2S_TxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Tx Transfer completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_RxHalfCpltCallback

Function name

void HAL_I2S_RxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer half completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_RxCpltCallback

Function name

void HAL_I2S_RxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2SEx_TxRxHalfCpltCallback

Function name

void HAL_I2SEx_TxRxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer half completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2SEx_TxRxCpltCallback

Function name

void HAL_I2SEx_TxRxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

Rx Transfer completed callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_ErrorCallback

Function name

void HAL_I2S_ErrorCallback (I2S_HandleTypeDef * hi2s)

Function description

I2S error callbacks.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **None:**

HAL_I2S_GetState

Function name

HAL_I2S_StateTypeDef HAL_I2S_GetState (const I2S_HandleTypeDef * hi2s)

Function description

Return the I2S state.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **HAL:** state

HAL_I2S_GetError

Function name

uint32_t HAL_I2S_GetError (const I2S_HandleTypeDef * hi2s)

Function description

Return the I2S error code.

Parameters

- **hi2s:** pointer to a I2S_HandleTypeDef structure that contains the configuration information for I2S module

Return values

- **I2S:** Error Code

38.3 I2S Firmware driver defines

The following section lists the various define and macros of the module.

38.3.1 I2S

I2S

I2S Audio Frequency

I2S_AUDIOFREQ_192K

I2S_AUDIOFREQ_96K

I2S_AUDIOFREQ_48K

I2S_AUDIOFREQ_44K

I2S_AUDIOFREQ_32K

I2S_AUDIOFREQ_22K

I2S_AUDIOFREQ_16K

I2S_AUDIOFREQ_11K

I2S_AUDIOFREQ_8K

I2S_AUDIOFREQ_DEFAULT

I2S FullDuplex Mode

I2S_CPOL_LOW

I2S_CPOL_HIGH

Data Padding 24Bit

I2S_DATA_24BIT_ALIGNMENT_RIGHT

I2S_DATA_24BIT_ALIGNMENT_LEFT

I2S Data Format

I2S_DATAFORMAT_16B

I2S_DATAFORMAT_16B_EXTENDED

I2S_DATAFORMAT_24B

I2S_DATAFORMAT_32B

I2S Error

HAL_I2S_ERROR_NONE
No error

HAL_I2S_ERROR_TIMEOUT
Timeout error

HAL_I2S_ERROR_OVR
OVR error

HAL_I2S_ERROR_UDR
UDR error

HAL_I2S_ERROR_DMA
DMA transfer error

HAL_I2S_ERROR_PRESCALER
Prescaler Calculation error

HAL_I2S_ERROR_FRE
FRE error

HAL_I2S_ERROR_NO_OGT
No On Going Transfer error

HAL_I2S_ERROR_NOT_SUPPORTED
Requested operation not supported

HAL_I2S_ERROR_INVALID_CALLBACK
Invalid Callback error

I2S Exported Macros

__HAL_I2S_RESET_HANDLE_STATE

Description:

- Reset I2S handle state.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_ENABLE

Description:

- Enable the specified SPI peripheral (in I2S mode).

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_DISABLE

Description:

- Disable the specified SPI peripheral (in I2S mode).

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_ENABLE_IT

Description:

- Enable the specified I2S interrupts.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- None

__HAL_I2S_DISABLE_IT

Description:

- Disable the specified I2S interrupts.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- None

__HAL_I2S_GET_IT_SOURCE

Description:

- Check if the specified I2S interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the I2S interrupt source to check. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_DXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- The: new state of __IT__ (TRUE or FALSE).

__HAL_I2S_GET_FLAG

Description:

- Check whether the specified I2S flag is set or not.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2S_FLAG_RXP : Rx-Packet available flag
  - I2S_FLAG_TXP : Tx-Packet space available flag
  - I2S_FLAG_UDR : Underrun flag
  - I2S_FLAG_OVR : Overrun flag
  - I2S_FLAG_FRE : TI mode frame format error flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_I2S_CLEAR_OVRFLAG

Description:

- Clear the I2S OVR pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_CLEAR_UDRFLAG

Description:

- Clear the I2S UDR pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_CLEAR_TIFREFLAG

Description:

- Clear the I2S FRE pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

39 HAL I3C Generic Driver

39.1 I3C Firmware driver registers structures

39.1.1 I3C_InitTypeDef

I3C_InitTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***LL_I3C_CtrlBusConfTypeDef CtrlBusCharacteristic***
- ***LL_I3C_TgtBusConfTypeDef TgtBusCharacteristic***

Field Documentation

- ***LL_I3C_CtrlBusConfTypeDef I3C_InitTypeDef::CtrlBusCharacteristic***
  Specifies the I3C controller bus characteristic configuration when Controller mode
- ***LL_I3C_TgtBusConfTypeDef I3C_InitTypeDef::TgtBusCharacteristic***
  Specifies the I3C target bus characteristic configuration when Target mode

39.1.2 I3C_FifoConfTypeDef

I3C_FifoConfTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint32_t RxFifoThreshold***
- ***uint32_t TxFifoThreshold***
- ***uint32_t ControlFifo***
- ***uint32_t StatusFifo***

Field Documentation

- ***uint32_t I3C_FifoConfTypeDef::RxFifoThreshold***
  Specifies the I3C Rx FIFO threshold level. This parameter must be a value of ***I3C_RX_FIFO_THRESHOLD***
- ***uint32_t I3C_FifoConfTypeDef::TxFifoThreshold***
  Specifies the I3C Tx FIFO threshold level. This parameter must be a value of ***I3C_TX_FIFO_THRESHOLD***
- ***uint32_t I3C_FifoConfTypeDef::ControlFifo***
  Specifies the I3C control FIFO enable/disable state. This parameter is configured only with controller mode and it must be a value of ***I3C_CONTROL_FIFO_STATE***
- ***uint32_t I3C_FifoConfTypeDef::StatusFifo***
  Specifies the I3C status FIFO enable/disable state. This parameter is configured only with controller mode and it must be a value of ***I3C_STATUS_FIFO_STATE***

39.1.3 I3C_CtrlConfTypeDef

I3C_CtrlConfTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint8_t DynamicAddr***
- ***uint8_t StallTime***
- ***FunctionalState HotJoinAllowed***
- ***FunctionalState ACKStallState***
- ***FunctionalState CCCStallState***
- ***FunctionalState TxStallState***
- ***FunctionalState RxStallState***
- ***FunctionalState HighKeeperSDA***

Field Documentation

- ***uint8_t I3C_CtrlConfTypeDef::DynamicAddr***
  Specifies the dynamic address of the controller when goes in target mode. This parameter must be a number between Min_Data=0x00 and Max_Data=0x7F

- ***uint8_t I3C_CtrlConfTypeDef::StallTime***
  Specifies the controller clock stall time in number of kernel clock cycles. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF
- ***FunctionalState I3C_CtrlConfTypeDef::HotJoinAllowed***
  Specifies the Enable/Disable state of the controller Hot Join acknowledgement when receiving a hot join request from target. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::ACKStallState***
  Specifies the Enable/Disable state of the controller clock stall on the ACK phase. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::CCCStallState***
  Specifies the Enable/Disable state of the controller clock stall on the T bit phase of a CCC communication to allow the target to decode command. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::TxStallState***
  Specifies the Enable/Disable state of the controller clock stall on parity phase of data to allow the target to read received data. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::RxStallState***
  Specifies the Enable/Disable state of the controller clock stall on the T bit phase of data enable to allow the target to prepare data to be sent. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::HighKeeperSDA***
  Specifies the Enable/Disable state of the controller SDA high keeper. This parameter can be set to ENABLE or DISABLE

39.1.4 I3C_TgtConfTypeDef

I3C_TgtConfTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint8_t Identifier***
- ***uint8_t MIPIIdentifier***
- ***FunctionalState CtrlRoleRequest***
- ***FunctionalState HotJoinRequest***
- ***FunctionalState IBIRequest***
- ***FunctionalState IBIPayload***
- ***uint32_t IBIPayloadSize***
- ***uint16_t MaxReadDataSize***
- ***uint16_t MaxWriteDataSize***
- ***FunctionalState CtrlCapability***
- ***FunctionalState GroupAddrCapability***
- ***uint32_t DataTurnAroundDuration***
- ***uint8_t MaxReadTurnAround***
- ***uint32_t MaxDataSpeed***
- ***FunctionalState MaxSpeedLimitation***
- ***uint32_t HandOffActivityState***
- ***FunctionalState HandOffDelay***
- ***FunctionalState PendingReadMDB***

Field Documentation

- ***uint8_t I3C_TgtConfTypeDef::Identifier***
  Specifies the target characteristic ID (MIPI named reference DCR). This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF
- ***uint8_t I3C_TgtConfTypeDef::MIPIIdentifier***
  Specifies the bits [12-15] of the 48-provisioned ID (MIPI named reference PID), other 48-provisioned ID are hardcoded. This parameter must be a number between Min_Data=0x00 and Max_Data=0x0F
- ***FunctionalState I3C_TgtConfTypeDef::CtrlRoleRequest***
  Specifies the Enable/Disable state of the target authorization request for a second master Chip. This parameter can be set to ENABLE or DISABLE

- ***FunctionalState I3C_TgtConfTypeDef::HotJoinRequest***
  Specifies the Enable/Disable state of the target hot join authorization request. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::IBIRequest***
  Specifies the Enable/Disable state of the target in Band Interrupt authorization request. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::IBIPayload***
  Specifies the Enable/Disable state of sending data payload after an accepted IBI. This parameter can be set to ENABLE or DISABLE
- ***uint32_t I3C_TgtConfTypeDef::IBIPayloadSize***
  Specifies the I3C target payload data size. This parameter must be a value of ***I3C_PAYLOAD_SIZE***
- ***uint16_t I3C_TgtConfTypeDef::MaxReadDataSize***
  Specifies the numbers of data bytes that the target can read at maximum. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFFFF
- ***uint16_t I3C_TgtConfTypeDef::MaxWriteDataSize***
  Specifies the numbers of data bytes that the target can write at maximum. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFFFF
- ***FunctionalState I3C_TgtConfTypeDef::CtrlCapability***
  Specifies the Enable/Disable state of the target controller capability. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::GroupAddrCapability***
  Specifies the Enable/Disable state of the target support of group address after a controller role hand-off. This parameter can be set to ENABLE or DISABLE
- ***uint32_t I3C_TgtConfTypeDef::DataTurnAroundDuration***
  Specifies the I3C target clock-to-data turnaround time. This parameter must be a value of ***I3C_TURNAROUND_TIME_TSCO***
- ***uint8_t I3C_TgtConfTypeDef::MaxReadTurnAround***
  Specifies the target maximum read turnaround byte. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF
- ***uint32_t I3C_TgtConfTypeDef::MaxDataSpeed***
  Specifies the I3C target returned GETMXDS CCC format. This parameter must be a value of ***I3C_GETMXDS_FORMAT***
- ***FunctionalState I3C_TgtConfTypeDef::MaxSpeedLimitation***
  Specifies the Enable/Disable state of the target max data speed limitation. This parameter can be set to ENABLE or DISABLE
- ***uint32_t I3C_TgtConfTypeDef::HandOffActivityState***
  Specifies the I3C target activity state when becoming controller. This parameter must be a value of ***I3C_HANDOFF_ACTIVITY_STATE***
- ***FunctionalState I3C_TgtConfTypeDef::HandOffDelay***
  Specifies the Enable/Disable state of the target need of delay to process the controller role hand-off. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::PendingReadMDB***
  Specifies the Enable/Disable state of the transmission of a mandatory data bytes indicating a pending read notification for GETCAPR CCC command. This parameter can be set to ENABLE or DISABLE

39.1.5 I3C_DeviceConfTypeDef

I3C_DeviceConfTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint8_t DeviceIndex***
- ***uint8_t TargetDynamicAddr***
- ***FunctionalState IBIAck***
- ***FunctionalState IBIPayload***
- ***FunctionalState CtrlRoleReqAck***
- ***FunctionalState CtrlStopTransfer***

Field Documentation

- ***uint8_t I3C_DeviceConfTypeDef::DeviceIndex***
  Specifies the index value of the device in the DEVRx register. This parameter must be a number between Min_Data=1 and Max_Data=4
- ***uint8_t I3C_DeviceConfTypeDef::TargetDynamicAddr***
  Specifies the dynamic address of the target x (1 to 4) connected on the bus. This parameter must be a number between Min_Data=0x00 and Max_Data=0x7F
- ***FunctionalState I3C_DeviceConfTypeDef::IBIAck***
  Specifies the Enable/Disable state of the controller's ACK when receiving an IBI from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_DeviceConfTypeDef::IBIPayload***
  Specifies the Enable/Disable state of the controller's receiving IBI payload after acknowledging an IBI requested from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_DeviceConfTypeDef::CtrlRoleReqAck***
  Specifies the Enable/Disable state of the controller's ACK when receiving a control request from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_DeviceConfTypeDef::CtrlStopTransfer***
  Specifies the Enable/Disable state of the controller's stop transfer after receiving an IBI request from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE

39.1.6 I3C_CCCInfoTypeDef

I3C_CCCInfoTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint32_t DynamicAddrValid***
- ***uint32_t DynamicAddr***
- ***uint32_t MaxWriteLength***
- ***uint32_t MaxReadLength***
- ***uint32_t ResetAction***
- ***uint32_t ActivityState***
- ***uint32_t HotJoinAllowed***
- ***uint32_t InBandAllowed***
- ***uint32_t CtrlRoleAllowed***
- ***uint32_t IBICRTgtAddr***
- ***uint32_t IBITgtNbPayload***
- ***uint32_t IBITgtPayload***

Field Documentation

- ***uint32_t I3C_CCCInfoTypeDef::DynamicAddrValid***
  I3C target Dynamic Address Valid (updated during ENTDAA/RSTDAA/SETNEWDA CCC) This parameter can be Valid=1U or Not Valid=0U
- ***uint32_t I3C_CCCInfoTypeDef::DynamicAddr***
  I3C target Dynamic Address (updated during ENTDAA/RSTDAA/SETNEWDA CCC)
- ***uint32_t I3C_CCCInfoTypeDef::MaxWriteLength***
  I3C target Maximum Write Length (updated during SETMWL CCC)
- ***uint32_t I3C_CCCInfoTypeDef::MaxReadLength***
  I3C target Maximum Read Length (updated during SETMRL CCC)
- ***uint32_t I3C_CCCInfoTypeDef::ResetAction***
  I3C target Reset Action level (updated during RSTACT CCC)
- ***uint32_t I3C_CCCInfoTypeDef::ActivityState***
  I3C target Activity State (updated during ENTASx CCC)
- ***uint32_t I3C_CCCInfoTypeDef::HotJoinAllowed***
  I3C target Hot Join (updated during ENEC/DISEC CCC) This parameter can be Allowed=1U or Not Allowed=0U
- ***uint32_t I3C_CCCInfoTypeDef::InBandAllowed***
  I3C target In Band Interrupt (updated during ENEC/DISEC CCC) This parameter can be Allowed=1U or Not Allowed=0U

- ***uint32_t I3C_CCCInfoTypeDef::CtrlRoleAllowed***
  I3C target Controller Role Request (updated during ENEC/DISEC CCC) This parameter can be Allowed=1U or Not Allowed=0U
- ***uint32_t I3C_CCCInfoTypeDef::IBICRTgtAddr***
  I3C controller receive Target Address during IBI or Controller Role Request event
- ***uint32_t I3C_CCCInfoTypeDef::IBITgtNbPayload***
  I3C controller get Number of Data Payload after an IBI event
- ***uint32_t I3C_CCCInfoTypeDef::IBITgtPayload***
  I3C controller receive IBI Payload after an IBI event

39.1.7 I3C_ControlTypeDef

I3C_ControlTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint32_t * pBuffer***
- ***uint32_t Size***

Field Documentation

- ***uint32_t* I3C_ControlTypeDef::pBuffer***
  Pointer to the buffer containing the control or status register values
- ***uint32_t I3C_ControlTypeDef::Size***
  The size of pBuffer in words

39.1.8 I3C_DataTypeDef

I3C_DataTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint8_t * pBuffer***
- ***uint32_t Size***

Field Documentation

- ***uint8_t* I3C_DataTypeDef::pBuffer***
  Pointer to the buffer containing all data values to transfer
- ***uint32_t I3C_DataTypeDef::Size***
  The size of pBuffer in bytes

39.1.9 I3C_CCCTypeDef

I3C_CCCTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint8_t TargetAddr***
- ***uint8_t CCC***
- ***I3C_DataTypeDef CCCBuf***
- ***uint32_t Direction***

Field Documentation

- ***uint8_t I3C_CCCTypeDef::TargetAddr***
  Dynamic or Static target Address
- ***uint8_t I3C_CCCTypeDef::CCC***
  CCC value code
- ***I3C_DataTypeDef I3C_CCCTypeDef::CCCBuf***
  Contain size of associated data and size of defining byte if any. Contain pointer to CCC associated data
- ***uint32_t I3C_CCCTypeDef::Direction***
  CCC read and/or write direction message

39.1.10 I3C_PrivateTypeDef

I3C_PrivateTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***uint8_t TargetAddr***
- ***I3C_DataTypeDef TxBuf***
- ***I3C_DataTypeDef RxBuf***
- ***uint32_t Direction***

Field Documentation

- ***uint8_t I3C_PrivateTypeDef::TargetAddr***
  Dynamic or Static target Address
- ***I3C_DataTypeDef I3C_PrivateTypeDef::TxBuf***
  Buffer structure containing the data to transmit (little endian)
- ***I3C_DataTypeDef I3C_PrivateTypeDef::RxBuf***
  Buffer structure containing the data to receive (little endian)
- ***uint32_t I3C_PrivateTypeDef::Direction***
  Read and/or write message

39.1.11 I3C_XferTypeDef

I3C_XferTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***I3C_ControlTypeDef CtrlBuf***
- ***I3C_ControlTypeDef StatusBuf***
- ***I3C_DataTypeDef TxBuf***
- ***I3C_DataTypeDef RxBuf***

Field Documentation

- ***I3C_ControlTypeDef I3C_XferTypeDef::CtrlBuf***
  Buffer structure containing the control register values
- ***I3C_ControlTypeDef I3C_XferTypeDef::StatusBuf***
  Buffer structure containing the status register values
- ***I3C_DataTypeDef I3C_XferTypeDef::TxBuf***
  Buffer structure containing the data to transmit
- ***I3C_DataTypeDef I3C_XferTypeDef::RxBuf***
  Buffer structure containing the data to receive

39.1.12 __I3C_HandleTypeDef

__I3C_HandleTypeDef is defined in the stm32h5xx_hal_i3c.h

Data Fields

- ***I3C_TypeDef * Instance***
- ***I3C_InitTypeDef Init***
- ***HAL_I3C_ModeTypeDef Mode***
- ***I3C_XferTypeDef * pXferData***
- ***const I3C_CCCTypeDef * pCCCDesc***
- ***const I3C_PrivateTypeDef * pPrivateDesc***
- ***uint32_t ControlXferCount***
- ***uint32_t RxXferCount***
- ***uint32_t TxXferCount***
- ***DMA_HandleTypeDef * hdmacr***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***DMA_HandleTypeDef * hdmasr***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_I3C_StateTypeDef State***
- ***__IO HAL_I3C_StateTypeDef PreviousState***
- ***__IO uint32_t ErrorCode***

- ***HAL_StatusTypeDef(* XferISR***
- ***void(* ptrTxFunc***
- ***void(* ptrRxFunc***
- ***void(* CtrlTxCpltCallback***
- ***void(* CtrlRxCpltCallback***
- ***void(* CtrlMultipleXferCpltCallback***
- ***void(* CtrlDAACpltCallback***
- ***void(* TgtReqDynamicAddrCallback***
- ***void(* TgtTxCpltCallback***
- ***void(* TgtRxCpltCallback***
- ***void(* TgtHotJoinCallback***
- ***void(* NotifyCallback***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***I3C_TypeDef* __I3C_HandleTypeDef::Instance***
  I3C registers base address
- ***I3C_InitTypeDef __I3C_HandleTypeDef::Init***
  I3C communication parameters
- ***HAL_I3C_ModeTypeDef __I3C_HandleTypeDef::Mode***
  I3C communication mode. This parameter must be a value of
  Section 39.3.1 I3C_mode_structure_definition
- ***I3C_XferTypeDef* __I3C_HandleTypeDef::pXferData***
  I3C transfer buffers pointer
- ***const I3C_CCCTypeDef* __I3C_HandleTypeDef::pCCCDesc***
  I3C CCC descriptor pointer
- ***const I3C_PrivateTypeDef* __I3C_HandleTypeDef::pPrivateDesc***
  I3C private transfer descriptor pointer
- ***uint32_t __I3C_HandleTypeDef::ControlXferCount***
  I3C counter indicating the remaining control data bytes to write in the control register
- ***uint32_t __I3C_HandleTypeDef::RxXferCount***
  I3C counter indicating the remaining data bytes to receive
- ***uint32_t __I3C_HandleTypeDef::TxXferCount***
  I3C counter indicating the remaining data bytes to transmit
- ***DMA_HandleTypeDef* __I3C_HandleTypeDef::hdmacr***
  I3C control DMA handle parameters
- ***DMA_HandleTypeDef* __I3C_HandleTypeDef::hdmatx***
  I3C Tx DMA handle parameters
- ***DMA_HandleTypeDef* __I3C_HandleTypeDef::hdmarx***
  I3C Rx DMA handle parameters
- ***DMA_HandleTypeDef* __I3C_HandleTypeDef::hdmasr***
  I3C status DMA handle parameters
- ***HAL_LockTypeDef __I3C_HandleTypeDef::Lock***
  I3C locking object
- ***__IO HAL_I3C_StateTypeDef __I3C_HandleTypeDef::State***
  I3C communication state
- ***__IO HAL_I3C_StateTypeDef __I3C_HandleTypeDef::PreviousState***
  I3C communication previous state
- ***__IO uint32_t __I3C_HandleTypeDef::ErrorCode***
  I3C Error code

- ***HAL_StatusTypeDef(* __I3C_HandleTypeDef::XferISR)(struct __I3C_HandleTypeDef *hi3c, uint32_t itFlags, uint32_t itSources)***
  I3C transfer IRQ handler function pointer
- ***void(* __I3C_HandleTypeDef::ptrTxFunc)(struct __I3C_HandleTypeDef *hi3c)***
  I3C transmit function pointer
- ***void(* __I3C_HandleTypeDef::ptrRxFunc)(struct __I3C_HandleTypeDef *hi3c)***
  I3C receive function pointer
- ***void(* __I3C_HandleTypeDef::CtrlTxCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Controller private data and CCC Tx Transfer complete callback
- ***void(* __I3C_HandleTypeDef::CtrlRxCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Controller private data and CCC Rx Transfer completed callback
- ***void(* __I3C_HandleTypeDef::CtrlMultipleXferCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Controller multiple Direct CCC, I3C private or I2C Transfer completed callback
- ***void(* __I3C_HandleTypeDef::CtrlDAACpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Controller Dynamic Address Assignment completed callback
- ***void(* __I3C_HandleTypeDef::TgtReqDynamicAddrCallback)(struct __I3C_HandleTypeDef *hi3c, uint64_t targetPayload)***
  I3C Controller request dynamic address callback during Dynamic Address Assignment processus
- ***void(* __I3C_HandleTypeDef::TgtTxCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Target private data Tx Transfer completed callback
- ***void(* __I3C_HandleTypeDef::TgtRxCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Target private data Rx Transfer completed callback
- ***void(* __I3C_HandleTypeDef::TgtHotJoinCallback)(struct __I3C_HandleTypeDef *hi3c, uint8_t dynamicAddress)***
  I3C Target Hot-Join callback
- ***void(* __I3C_HandleTypeDef::NotifyCallback)(struct __I3C_HandleTypeDef *hi3c, uint32_t eventId)***
  I3C Target or Controller asynchronous events callback
- ***void(* __I3C_HandleTypeDef::ErrorCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Error callback
- ***void(* __I3C_HandleTypeDef::AbortCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Abort complete callback
- ***void(* __I3C_HandleTypeDef::MspInitCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Msp Init callback
- ***void(* __I3C_HandleTypeDef::MspDeInitCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Msp DeInit callback

39.2 I3C Firmware driver API description

The following section lists the various functions of the I3C library.

39.2.1 How to use this driver

The I3C HAL driver can be used as follows:

1. Declare a I3C_HandleTypeDef handle structure, for example: I3C_HandleTypeDef hi3c;
2. Declare a I3C_XferTypeDef transfer descriptor structure, for example: I3C_XferTypeDef ContextBuffers;

3. Initialize the I3C low level resources by implementing the HAL_I3C_MspInit() API:
   a. Enable the I3Cx interface clock
   b. I3C pins configuration
      - Enable the clock for the I3C GPIOs
      - Configure I3C pins as alternate function push-pull with no-pull
   c. NVIC configuration if you need to use interrupt process
      - Configure the I3Cx interrupt priority
      - Enable the NVIC I3C IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the Command Common Code (CCC) management channel
      - Declare a DMA_HandleTypeDef handle structure for the transmit channel
      - Declare a DMA_HandleTypeDef handle structure for the receive channel
      - Declare a DMA_HandleTypeDef handle structure for the status channel
      - Enable the DMAx interface clock
      - Configure the DMA handle parameters
      - Configure the DMA Command Common Code (CCC) channel
      - Configure the DMA Tx channel
      - Configure the DMA Rx channel
      - Configure the DMA Status channel
      - Associate the initialized DMA handle to the hi3c DMA CCC, Tx, Rx or Status handle as necessary
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA CCC, Tx, Rx or Status instance
4. Configure the HAL I3C Communication Mode as Controller or Target in the hi3c Init structure.
5. Configure the Controller Communication Bus characterics for Controller mode. This mean, configure the parameters SDAHoldTime, WaitTime, SCLPPLowDuration, SCLI3CHighDuration, SCLODLowDuration, SCLI2CHighDuration, BusFreeDuration, BusIdleDuration in the LL_I3C_CtrlBusConfTypeDef structure through h3c Init structure.
6. Configure the Target Communication Bus characterics for Target mode. This mean, configure the parameter BusAvailableDuration in the LL_I3C_TgtBusConfTypeDef structure through h3c Init structure. All these parameters for Controller or Target can be configured directly in user code or by using CubeMx generation. To help the computation of the different parameters, the recommendation is to use CubeMx. Those parameters can be modified after the hi3c initialization by using HAL_I3C_Ctrl_BusCharacteristicConfig() for controller and HAL_I3C_Tgt_BusCharacteristicConfig() for target.
7. Initialize the I3C registers by calling the HAL_I3C_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_I3C_MspInit(&hi3c) API.
8. Configure the different FIFO parameters in I3C_FifoConfTypeDef structure as RxFifoThreshold, TxFifoThreshold for Controller or Target mode. And enable/disable the Control or Status FIFO only for Controller Mode. Use HAL_I3C_SetConfigFifo() function to finalize the configuration, and HAL_I3C_GetConfigFifo() to retrieve FIFO configuration. Possibility to clear the FIFO configuration by using HAL_I3C_ClearConfigFifo() which reset the configuration FIFO to their default hardware value
9. Configure the different additional Controller configuration in I3C_CtrlConfTypeDef structure as DynamicAddr, StallTime, HotJoinAllowed, ACKStallState, CCCStallState, TxStallState, RxStallState, HighKeeperSDA. Use HAL_I3C_Ctrl_Config() function to finalize the Controller configuration.
10. Configure the different additional Target configuration in I3C_TgtConfTypeDef structure as Identifier, MIPIIdentifier, CtrlRoleRequest, HotJoinRequest, IBIRequest, IBIPayload, IBIPayloadSize, MaxReadDataSize, MaxWriteDataSize, CtrlCapability, GroupAddrCapability, DataTurnAroundDuration, MaxReadTurnAround, MaxDataSpeed, MaxSpeedLimitation, HandOffActivityState, HandOffDelay, PendingReadMDB. Use HAL_I3C_Tgt_Config() function to finalize the Target configuration.

11. Before initiate any IO operation, the application must launch an assignment of the different Target dynamic address by using HAL_I3C_Ctrl_DynAddrAssign() in polling mode or HAL_I3C_Ctrl_DynAddrAssign_IT() in interrupt mode. This procedure is named Enter Dynamic Address Assignment (ENTDAA CCC command). For the initiation of ENTDAA procedure from the controller, each target connected and powered on the I3C bus must repond to this particular Command Common Code by sending its proper Payload (a amount of 48bits which contain the target characteristics) Each time a target responds to ENTDAA sequence, the application is informed through HAL_I3C_TgtReqDynamicAddrCallback() of the reception of the target paylaod. And then application must send a associated dynamic address through HAL_I3C_Ctrl_SetDynAddr(). This procedure in loop automatically in hardware side until a target respond to repeated ENTDAA sequence. The application is informed of the end of the procedure at reception of HAL_I3C_CtrlDAACpltCallback(). At the end of procedure, the function HAL_I3C_Ctrl_ConfigBusDevices() must be called to store in hardware register part the target capabilities as Dynamic address, IBI support with or without additional data byte, Controller role request support, Controller stop transfer after IBI through I3C_DeviceConfTypeDef structure.
12. Other action to be done, before initiate any IO operation, the application must prepare the different frame descriptor with its associated buffer allocation in their side. Configure the different information related to CCC transfer through I3C_CCCTypeDef structure Configure the different information related to Private or I2C transfer through I3C_PrivateTypeDef structure Configure the different buffer pointers and associated size needed for the driver communication through I3C_XferTypeDef structure The I3C_XferTypeDef structure contains different parameters about Control, Status buffer, and Transmit and Receive buffer. Use HAL_I3C_AddDescToFrame() function each time application add a descriptor in the frame before call an IO operation interface One element of the frame descriptor correspond to one frame to manage through IO operation.
13. To check if I3C target device is ready for communication, use the function HAL_I3C_Ctrl_IsDeviceI3C_Ready()
14. To check if I2C target device is ready for communication, use the function HAL_I3C_Ctrl_IsDeviceI2C_Ready()
15. For I3C IO operations, three operation modes are available within this driver :

Polling mode IO operation

- Activate asynchronous event in controller or target mode a Common Command Code in a broadcast or a direct communication in blocking mode using HAL_I3C_Ctrl_TransmitCCC()
- Transmit in controller mode a Common Command Code in a broadcast or a direct communication in blocking mode using HAL_I3C_Ctrl_TransmitCCC()
- Receive in controller mode a Common Command Code in a direct communication in blocking mode using HAL_I3C_Ctrl_ReceiveCCC()
- Transmit in controller mode an amount of private data in an I3C or an I2C communication in blocking mode using HAL_I3C_Ctrl_Transmit()
- Receive in controller mode an amount of private data in an I3C or an I2C communication in blocking mode using HAL_I3C_Ctrl_Receive()
- Transmit in target mode an amount of private data in an I3C communication in blocking mode using HAL_I3C_Tgt_Transmit()
- Receive in target mode an amount of private data in an I3C communication in blocking mode using HAL_I3C_Tgt_Receive()
- At the end of a transfer, the different FIFO can be flushed if necessary by using HAL_I3C_FlushAllFifo() for flush all the FIFO, or flush individually y using HAL_I3C_FlushTxFifo(), HAL_I3C_FlushRxFifo(), HAL_I3C_FlushControlFifo(), HAL_I3C_FlushStatusFifo().
- Request a HotJoin in target mode in blocking mode using HAL_I3C_Tgt_HotJoinReq()
- Request a In Band Interrupt in target mode in blocking mode using HAL_I3C_Tgt_IBIReq()
- Request a Controller Role in target mode in blocking mode using HAL_I3C_Tgt_ControlRoleReq()

DMA and Interrupt mode IO operation

- Transmit in controller mode a Common Command Code in a broadcast or a direct communication in non-blocking mode using HAL_I3C_Ctrl_TransmitCCC_IT() or HAL_I3C_Ctrl_TransmitCCC_DMA()
- At transmission end of transfer, HAL_I3C_CtrlTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlTxCpltCallback()

- Receive in controller mode a Common Command Code in a direct communication in non-blocking mode using HAL_I3C_Ctrl_ReceiveCCC_IT() or HAL_I3C_Ctrl_ReceiveCCC_DMA()
- At reception end of transfer, HAL_I3C_CtrlRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlRxCpltCallback()
- Transmit in controller mode an amount of private data in an I3C or an I2C communication in non-blocking mode using HAL_I3C_Ctrl_Transmit_IT() or HAL_I3C_Ctrl_Transmit_DMA()
- At transmission end of transfer, HAL_I3C_CtrlTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlTxCpltCallback()
- Receive in controller mode an amount of private data in an I3C or an I2C communication in non-blocking mode using HAL_I3C_Ctrl_Receive_IT() or HAL_I3C_Ctrl_Receive_DMA()
- At reception end of transfer, HAL_I3C_CtrlRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlRxCpltCallback()
- Transfer in multiple direction (transmit/receive) in controller mode a Common Command Code in a direct communication or an amount of private data in an I2C or I3C communication in non-blocking mode using HAL_I3C_Ctrl_MultipleTransfer_IT() or HAL_I3C_Ctrl_MultipleTransfer_DMA()
- At the end of transfer, HAL_I3C_CtrlMultipleXferCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlMultipleXferCpltCallback()
- Transmit in target mode an amount of private data in an I3C communication in non-blocking mode using HAL_I3C_Tgt_Transmit_IT() or HAL_I3C_Tgt_Transmit_DMA()
- At transmission end of transfer, HAL_I3C_TgtTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_TgtTxCpltCallback()
- Receive in target mode an amount of private data in an I3C communication in non-blocking mode using HAL_I3C_Tgt_Receive_IT() or HAL_I3C_Tgt_Receive_DMA()
- At reception end of transfer, HAL_I3C_TgtRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_TgtRxCpltCallback()
- To treat asynchronous event, HAL_I3C_ActivateNotification() or HAL_I3C_DeactivateNotification() function is used for enable or disable one or more notification related to specific asynchronous event. Each time one or more event detected by hardware the associated HAL_I3C_NotifyCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_NotifyCallback(). Then application can easily retrieve some specific associated event data through HAL_I3C_GetCCCInfo() function
- At the end of a transfer, the different FIFO can be flushed if necessary by using HAL_I3C_FlushAllFifo() for flush all the FIFO, or flush individually y using HAL_I3C_FlushTxFifo(), HAL_I3C_FlushRxFifo(), HAL_I3C_FlushControlFifo(), HAL_I3C_FlushStatusFifo().
- Request a HotJoin in target mode in non-blocking mode using HAL_I3C_Tgt_HotJoinReq_IT
- At completion, HAL_I3C_TgtHotJoinCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_TgtHotJoinCallback()
- Request an In Band Interrupt in target mode in non-blocking mode using HAL_I3C_Tgt_IBIReq_IT()
- At completion, HAL_I3C_NotifyCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_NotifyCallback()
- Request a Controller Role in target mode in non-blocking mode using HAL_I3C_Tgt_ControlRoleReq_IT()
- At completion, HAL_I3C_NotifyCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_NotifyCallback()
- To manage the wakeup capability, HAL_I3C_ActivateNotification() or HAL_I3C_DeactivateNotification() function is used for enable or disable Wake Up interrupt. At wakeup detection the associated HAL_I3C_NotifyCallback() is executed.
- In case of transfer Error, HAL_I3C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I3C_ErrorCallback()
- Abort an I3C process communication with Interrupt using HAL_I3C_Abort_IT()
- End of abort process, HAL_I3C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_AbortCpltCallback()

I3C HAL driver macros list

Below the list of most used macros in I3C HAL driver.

- __HAL_I3C_ENABLE: Enable the I3C peripheral
- __HAL_I3C_DISABLE: Disable the I3C peripheral

- __HAL_I3C_RESET_HANDLE_STATE: Reset the I3C handle state
- __HAL_I3C_GET_FLAG: Check whether the specified I3C flag is set or not

Callback registration

The compilation flag USE_HAL_I3C_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_I3C_RegisterCallback() or HAL_I3C_RegisterNotifyCallback() or HAL_I3C_RegisterTgtReqDynamicAddrCallback() or HAL_I3C_RegisterTgtHotJoinCallback() to register an interrupt callback.

Function HAL_I3C_RegisterCallback() allows to register following callbacks:

- CtrlTxCpltCallback : callback for Controller transmission CCC, I3C private or I2C end of transfer.
- CtrlRxCpltCallback : callback for Controller reception CCC, I3C private or I2C end of transfer.
- CtrlMultipleXferCpltCallback : callback for Controller multiple Direct CCC, I3C private or I2C end of transfer.
- CtrlDAACpltCallback : callback for Controller Enter Dynamic Address Assignment end of transfer.
- TgtTxCpltCallback : callback for Target transmission I3C private end of transfer.
- TgtRxCpltCallback : callback for Target reception I3C private end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback NotifyCallback use dedicated register callbacks : HAL_I3C_RegisterNotifyCallback().

For specific callback TgtReqDynamicAddrCallback use dedicated register callbacks : HAL_I3C_RegisterTgtReqDynamicAddrCallback().

For specific callback TgtHotJoinCallback use dedicated register callbacks : HAL_I3C_RegisterTgtHotJoinCallback().

Use function HAL_I3C_UnRegisterCallback to reset a callback to the default weak function. HAL_I3C_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- CtrlTxCpltCallback : callback for Controller transmission CCC, I3C private or I2C end of transfer.
- CtrlRxCpltCallback : callback for Controller reception CCC, I3C private or I2C end of transfer.
- CtrlMultipleXferCpltCallback : callback for Controller multiple Direct CCC, I3C private or I2C end of transfer.
- CtrlDAACpltCallback : callback for Controller Enter Dynamic Address Assignment end of transfer.
- TgtTxCpltCallback : callback for Target transmission I3C private end of transfer.
- TgtRxCpltCallback : callback for Target reception I3C private end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.
- NotifyCallback : callback for Controller and Target notification process.
- TgtReqDynamicAddrCallback : callback for controller application when a target sent its payload to the controller during Dynamic Address Assignment process.
- TgtHotJoinCallback : callback for Target Hotjoin completion process.

By default, after the HAL_I3C_Init() and when the state is HAL_I3C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I3C_CtrlTxCpltCallback(), HAL_I3C_CtrlRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I3C_Init()/ HAL_I3C_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I3C_Init()/ HAL_I3C_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I3C_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I3C_STATE_READY or HAL_I3C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I3C_RegisterCallback() before calling HAL_I3C_DeInit() or HAL_I3C_Init() function.

When the compilation flag USE_HAL_I3C_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the I3C HAL driver header file for more useful macros

39.2.2 Detailed description of functions

HAL_I3C_Init

Function name

HAL_StatusTypeDef HAL_I3C_Init (I3C_HandleTypeDef * hi3c)

Function description

Initializes the I3C instance by activating the low-level hardware and configuring the bus characteristic according to the specified parameters in the I3C_InitTypeDef.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_DeInit

Function name

HAL_StatusTypeDef HAL_I3C_DeInit (I3C_HandleTypeDef * hi3c)

Function description

DeInitialize the I3C peripheral.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_MspInit

Function name

void HAL_I3C_MspInit (I3C_HandleTypeDef * hi3c)

Function description

Initialize the I3C MSP.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_MspDeInit

Function name

void HAL_I3C_MspDeInit (I3C_HandleTypeDef * hi3c)

Function description

DeInitialize the I3C MSP.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterCallback (I3C_HandleTypeDef * hi3c, HAL_I3C_CallbackIDTypeDef callbackID, pI3C_CallbackTypeDef pCallback)

Function description

Register a User I3C Callback to be used instead of the weak predefined callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **callbackID:** : [IN] ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_I3C_CTRL_TX_COMPLETE_CB_ID
  - HAL_I3C_CTRL_RX_COMPLETE_CB_ID
  - HAL_I3C_CTRL_MULTIPLE_XFER_COMPLETE_CB_ID
  - HAL_I3C_CTRL_DAA_COMPLETE_CB_ID
  - HAL_I3C_TGT_TX_COMPLETE_CB_ID
  - HAL_I3C_TGT_RX_COMPLETE_CB_ID
  - HAL_I3C_ERROR_CB_ID
  - HAL_I3C_ABORT_CB_ID
  - HAL_I3C_MSPINIT_CB_ID
  - HAL_I3C_MSPDEINIT_CB_ID
- **pCallback:** : [IN] Pointer to the Callback function.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The HAL_I3C_RegisterCallback() may be called before HAL_I3C_Init() in HAL_I3C_STATE_RESET to register callbacks for HAL_I3C_MSPINIT_CB_ID and HAL_I3C_MSPDEINIT_CB_ID

HAL_I3C_RegisterNotifyCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterNotifyCallback (I3C_HandleTypeDef * hi3c, pI3C_NotifyCallbackTypeDef pNotifyCallback)

Function description

Register a User I3C Notify Callback to be used instead of the weak predefined callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pNotifyCallback:** : [IN] Pointer to the Callback function.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_RegisterTgtReqDynamicAddrCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterTgtReqDynamicAddrCallback (I3C_HandleTypeDef * hi3c, pI3C_TgtReqDynamicAddrCallbackTypeDef pTgtReqAddrCallback)

Function description

Register a User I3C dynamic address Callback to be used instead of the weak predefined callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pTgtReqAddrCallback:** : [IN] Pointer to the Callback function.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_RegisterTgtHotJoinCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterTgtHotJoinCallback (I3C_HandleTypeDef * hi3c, pI3C_TgtHotJoinCallbackTypeDef pTgtHotJoinCallback)

Function description

Register a User I3C hot join Callback to be used instead of the weak predefined callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pTgtHotJoinCallback:** : [IN] Pointer to the Callback function.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I3C_UnRegisterCallback (I3C_HandleTypeDef * hi3c, HAL_I3C_CallbackIDTypeDef callbackID)

Function description

Unregister a user I3C Callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **callbackID:** : [IN] ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_I3C_CTRL_TX_COMPLETE_CB_ID
  - HAL_I3C_CTRL_RX_COMPLETE_CB_ID
  - HAL_I3C_CTRL_MULTIPLE_XFER_COMPLETE_CB_ID
  - HAL_I3C_CTRL_DAA_COMPLETE_CB_ID
  - HAL_I3C_TGT_REQ_DYNAMIC_ADDR_CB_ID
  - HAL_I3C_TGT_TX_COMPLETE_CB_ID
  - HAL_I3C_TGT_RX_COMPLETE_CB_ID
  - HAL_I3C_TGT_HOTJOIN_CB_ID
  - HAL_I3C_NOTIFY_CB_ID
  - HAL_I3C_ERROR_CB_ID
  - HAL_I3C_ABORT_CB_ID
  - HAL_I3C_MSPINIT_CB_ID
  - HAL_I3C_MSPDEINIT_CB_ID

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The HAL_I3C_UnRegisterCallback() may be called before HAL_I3C_Init() in HAL_I3C_STATE_RESET to un-register callbacks for HAL_I3C_MSPINIT_CB_ID and HAL_I3C_MSPDEINIT_CB_ID

HAL_I3C_ActivateNotification

Function name

HAL_StatusTypeDef HAL_I3C_ActivateNotification (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t interruptMask)

Function description

This function permits to activate the I3C notifications.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN/OUT] Pointer to an I3C_XferTypeDef structure that contains the reception buffer to retrieve data during broadcast CCC DEFTGTS and DEFGRPA when Target mode only.
- **interruptMask:** : [IN] Parameter indicates which interrupts will be enabled. This parameter can be any combination of
  - I3C_TARGET_INTERRUPT when the I3C is in target mode or a combination of
  - I3C_CONTROLLER_INTERRUPT when it is in controller mode.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_I3C_DeactivateNotification (I3C_HandleTypeDef * hi3c, uint32_t interruptMask)

Function description

This function permits to deactivate the I3C notifications.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **interruptMask:** : [IN] Parameter indicates which interrupts will be disabled. This parameter can be any combination of
  - I3C_TARGET_INTERRUPT when the I3C is in target mode or a combination of
  - I3C_CONTROLLER_INTERRUPT when it is in controller mode.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_CtrlTxCpltCallback

Function name

void HAL_I3C_CtrlTxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Controller Transmission Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_CtrlRxCpltCallback

Function name

void HAL_I3C_CtrlRxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Controller Reception Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_CtrlMultipleXferCpltCallback

Function name

void HAL_I3C_CtrlMultipleXferCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Controller multiple Direct CCC Command, I3C private or I2C transfer Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_CtrlDAACpltCallback

Function name

void HAL_I3C_CtrlDAACpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Controller dynamic address assignment Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_TgtReqDynamicAddrCallback

Function name

void HAL_I3C_TgtReqDynamicAddrCallback (I3C_HandleTypeDef * hi3c, uint64_t targetPayload)

Function description

Target Request Dynamic Address callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **targetPayload:** : [IN] Parameter indicates the target payload.

Return values

- **None:**

HAL_I3C_TgtTxCpltCallback

Function name

void HAL_I3C_TgtTxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Target Transmission Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_TgtRxCpltCallback

Function name

void HAL_I3C_TgtRxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Target Reception Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_TgtHotJoinCallback

Function name

void HAL_I3C_TgtHotJoinCallback (I3C_HandleTypeDef * hi3c, uint8_t dynamicAddress)

Function description

Target Hot join process Complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **dynamicAddress:** : [IN] The returned dynamic address value after the hot join process.

Return values

- **None:**

HAL_I3C_NotifyCallback

Function name

void HAL_I3C_NotifyCallback (I3C_HandleTypeDef * hi3c, uint32_t eventId)

Function description

Target/Controller Notification event callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **eventId:** : [IN] Parameter indicates which notification is signaled. It can be a combination value of I3C Notification ID definition.

Return values

- **None:**

HAL_I3C_AbortCpltCallback

Function name

void HAL_I3C_AbortCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

Abort complete callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_ErrorCallback

Function name

void HAL_I3C_ErrorCallback (I3C_HandleTypeDef * hi3c)

Function description

Error callback.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_ER_IRQHandler

Function name

void HAL_I3C_ER_IRQHandler (I3C_HandleTypeDef * hi3c)

Function description

This function handles I3C error interrupt request.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_EV_IRQHandler

Function name

void HAL_I3C_EV_IRQHandler (I3C_HandleTypeDef * hi3c)

Function description

This function handles I3C event interrupt request.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **None:**

HAL_I3C_Ctrl_BusCharacteristicConfig

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_BusCharacteristicConfig (I3C_HandleTypeDef * hi3c, const LL_I3C_CtrlBusConfTypeDef * pConfig)

Function description

Configure the Controller Bus characterics.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pConfig:** : [IN] Pointer to an LL_I3C_CtrlBusConfTypeDef structure contains controller bus configuration.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_BusCharacteristicConfig

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_BusCharacteristicConfig (I3C_HandleTypeDef * hi3c, const LL_I3C_TgtBusConfTypeDef * pConfig)

Function description

Configure the target Bus characterics.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pConfig:** : [IN] Pointer to an LL_I3C_TgtBusConfTypeDef structure contains target bus configuration.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_SetConfigFifo

Function name

HAL_StatusTypeDef HAL_I3C_SetConfigFifo (I3C_HandleTypeDef * hi3c, const I3C_FifoConfTypeDef * pConfig)

Function description

Set I3C FIFOs configuration.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pConfig:** : [IN] Pointer to an I3C_FifoConfTypeDef structure contains FIFOs configuration.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Ctrl_Config

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Config (I3C_HandleTypeDef * hi3c, const I3C_CtrlConfTypeDef * pConfig)

Function description

Set I3C controller configuration.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pConfig:** : [IN] Pointer to an I3C_CtrlConfTypeDef structure that contains controller configuration.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- This function is called only when the I3C instance is initialized as controller.

HAL_I3C_Tgt_Config

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Config (I3C_HandleTypeDef * hi3c, const I3C_TgtConfTypeDef * pConfig)

Function description

Set I3C target configuration.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pConfig:** : [IN] Pointer to an I3C_TgtConfTypeDef structure that contains target configuration.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- This function is called only when the I3C instance is initialized as target.

HAL_I3C_Ctrl_ConfigBusDevices

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ConfigBusDevices (I3C_HandleTypeDef * hi3c, const I3C_DeviceConfTypeDef * pDesc, uint8_t nbDevice)

Function description

Set I3C bus devices configuration.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pDesc:** : [IN] Pointer to an I3C_DeviceConfTypeDef descriptor that contains the bus devices configurations.
- **nbDevice:** : [IN] Value specifies the number of devices to be treated. This parameter must be a number between Min_Data=1U and Max_Data=4U.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- This function is called only when the I3C instance is initialized as controller. This function can be called by the controller application to help the automatic treatment when target have capability of IBI and/or Control-Role.

HAL_I3C_AddDescToFrame

Function name

HAL_StatusTypeDef HAL_I3C_AddDescToFrame (I3C_HandleTypeDef * hi3c, const I3C_CCCTypeDef * pCCCDesc, const I3C_PrivateTypeDef * pPrivateDesc, I3C_XferTypeDef * pXferData, uint8_t nbFrame, uint32_t option)

Function description

Add Private or CCC descriptor in the user data transfer descriptor.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pCCCDesc:** : [IN] Pointer to an I3C_CCCTypeDef structure that contains the CCC descriptor information.
- **pPrivateDesc:** : [IN] Pointer to an I3C_PrivateTypeDef structure that contains the transfer descriptor.
- **pXferData:** : [IN/OUT] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer).
- **nbFrame:** : [IN] The number of CCC commands or the number of device to treat.
- **option:** : [IN] Value indicates the transfer option. It can be one value of OPTION DEFINITION

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- This function must be called before initiate any communication transfer. This function help the preparation of the full transfer usecase in a transfer descriptor which contained different buffer pointers and their associated size through I3C_XferTypeDef.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.

HAL_I3C_FlushAllFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushAllFifo (I3C_HandleTypeDef * hi3c)

Function description

Flush all I3C FIFOs content.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_FlushTxFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushTxFifo (I3C_HandleTypeDef * hi3c)

Function description

Flush I3C Tx FIFO content.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_FlushRxFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushRxFifo (I3C_HandleTypeDef * hi3c)

Function description

Flush I3C Rx FIFO content.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_FlushControlFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushControlFifo (I3C_HandleTypeDef * hi3c)

Function description

Flush I3C control FIFO content.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_FlushStatusFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushStatusFifo (I3C_HandleTypeDef * hi3c)

Function description

Flush I3C status FIFO content.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_ClearConfigFifo

Function name

HAL_StatusTypeDef HAL_I3C_ClearConfigFifo (I3C_HandleTypeDef * hi3c)

Function description

Clear I3C FIFOs configuration and set it to default values.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_GetConfigFifo

Function name

HAL_StatusTypeDef HAL_I3C_GetConfigFifo (I3C_HandleTypeDef * hi3c, I3C_FifoConfTypeDef * pConfig)

Function description

Get I3C FIFOs current configuration.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pConfig:** : [IN/OUT] Pointer to an I3C_FifoConfTypeDef structure that returns current FIFOs configuration.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Ctrl_TransmitCCC

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_TransmitCCC (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

Controller transmit direct write or a broadcast CCC command in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.

HAL_I3C_Ctrl_TransmitCCC_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_TransmitCCC_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller transmit direct write or a broadcast CCC command in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.

HAL_I3C_Ctrl_TransmitCCC_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_TransmitCCC_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller transmit direct write or a broadcast CCC command in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.

HAL_I3C_Ctrl_ReceiveCCC

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ReceiveCCC (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

Controller transmit direct read CCC command in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_ReceiveCCC_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ReceiveCCC_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller transmit direct read CCC command in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_ReceiveCCC_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ReceiveCCC_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller transmit direct read CCC command in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.

HAL_I3C_Ctrl_Transmit

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Transmit (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

Controller private write in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.
- The TxBuf.Size must be equal to the sum of all TxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Transmit_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller private write in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.
- The TxBuf.Size must be equal to the sum of all TxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Transmit_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller private write in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.
- The TxBuf.Size must be equal to the sum of all TxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_Receive

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Receive (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

Controller private read in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required reception buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_Receive_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Receive_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller private read in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required reception buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Receive_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller private read in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required reception buffers (control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_MultipleTransfer_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_MultipleTransfer_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller multiple Direct CCC Command, I3C private or I2C transfer in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmit and receive buffers (control buffer, data buffers and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.
- This function must be called to transfer read/write I3C or I2C private data or a direct read/write CCC.
- The TxBuf.Size must be equal to the sum of all TxBuf.Size exist in the descriptor.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.

HAL_I3C_Ctrl_MultipleTransfer_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_MultipleTransfer_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Controller multiple Direct CCC Command, I3C private or I2C transfer in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmit and receive buffers(control buffer, data buffer and status buffer). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- The function HAL_I3C_AddDescToFrame() must be called before initiate a transfer.
- The Tx FIFO threshold HAL_I3C_TXFIFO_THRESHOLD_4_4 is not allowed when the transfer descriptor contains multiple transmission frames.
- The TxBuf.Size must be equal to the sum of all TxBuf.Size exist in the descriptor.
- The RxBuf.Size must be equal to the sum of all RxBuf.Size exist in the descriptor.
- This function must be called to transfer read/write private data or a direct read/write CCC command.

HAL_I3C_Ctrl_SetDynAddr

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_SetDynAddr (I3C_HandleTypeDef * hi3c, uint8_t devAddress)

Function description

Controller set dynamic address.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **devAddress:** : [IN] Value of the dynamic address to be assigned.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Ctrl_DynAddrAssign_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_DynAddrAssign_IT (I3C_HandleTypeDef * hi3c, uint32_t dynOption)

Function description

Controller assign dynamic address (send a broadcast ENTDAA CCC command) in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **dynOption:** : [IN] Parameter indicates the Dynamic address assignment option. It can be one value of I3C DYNAMIC ADDRESS OPTION DEFINITION.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Ctrl_DynAddrAssign

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_DynAddrAssign (I3C_HandleTypeDef * hi3c, uint64_t * target_payload, uint32_t dynOption, uint32_t timeout)

Function description

Controller assign dynamic address (send a broadcast ENTDAA CCC command) in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **target_payload:** : [IN/OUT] Pointer to the returned target payload value.
- **dynOption:** : [IN] Parameter indicates the Dynamic address assignment option. It can be one value of I3C DYNAMIC ADDRESS OPTION DEFINITION.
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Ctrl_IsDeviceI3C_Ready

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_IsDeviceI3C_Ready (I3C_HandleTypeDef * hi3c, uint8_t devAddress, uint32_t trials, uint32_t timeout)

Function description

Check if I3C target device is ready for communication.

Parameters

- **hi3c:** : [IN] Pointer to a I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **devAddress:** : [IN] Value of the device dynamic address.
- **trials:** : [IN] Number of trials
- **timeout:** : [IN] Timeout duration

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Ctrl_IsDeviceI2C_Ready

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_IsDeviceI2C_Ready (I3C_HandleTypeDef * hi3c, uint8_t devAddress, uint32_t trials, uint32_t timeout)

Function description

Check if I2C target device is ready for communication.

Parameters

- **hi3c:** : [IN] Pointer to a I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **devAddress:** : [IN] Value of the device dynamic address.
- **trials:** : [IN] Number of trials
- **timeout:** : [IN] Timeout duration

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_Transmit

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Transmit (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

Target transmit private data in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers information (Pointer to the Tx buffer (TxBuf.pBuffer) and size of data to transmit in bytes (TxBuf.Size)). This value contain transfer data after called HAL_I3C_AddDescToFrame().
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

Notes

- Target FIFO preload data is forced within this API for timing purpose.

HAL_I3C_Tgt_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Transmit_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Target transmit private data in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers information (Pointer to the Tx buffer (TxBuf.pBuffer) and size of data to transmit in bytes (TxBuf.Size)). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Transmit_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Target transmit private data in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required transmission buffers information (Pointer to the Tx buffer (TxBuf.pBuffer) and size of data to transmit in bytes (TxBuf.Size)). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_Receive

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Receive (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

Target receive private data in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required reception buffers information (Pointer to the Rx buffer (RxBuf.pBuffer) and size of data to be received in bytes (RxBuf.Size)). This value contain transfer data after called HAL_I3C_AddDescToFrame().
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_Receive_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Receive_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Target receive private data in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required reception buffers information (Pointer to the Rx buffer (RxBuf.pBuffer) and size of data to be received in bytes (RxBuf.Size)). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Receive_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

Target receive private data in DMA mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pXferData:** : [IN] Pointer to an I3C_XferTypeDef structure that contains required reception buffers information (Pointer to the Rx buffer (RxBuf.pBuffer) and size of data to be received in bytes (RxBuf.Size)). This value contain transfer data after called HAL_I3C_AddDescToFrame().

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_ControlRoleReq

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_ControlRoleReq (I3C_HandleTypeDef * hi3c, uint32_t timeout)

Function description

Target send control role request in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_ControlRoleReq_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_ControlRoleReq_IT (I3C_HandleTypeDef * hi3c)

Function description

Target send control role request in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_HotJoinReq

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_HotJoinReq (I3C_HandleTypeDef * hi3c, uint8_t * pAddress, uint32_t timeout)

Function description

Target send hot join request in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pAddress:** : [IN/OUT] Pointer to the target own dynamic address assigned by the controller.
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_HotJoinReq_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_HotJoinReq_IT (I3C_HandleTypeDef * hi3c)

Function description

Target send hot join request in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_IBIReq

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_IBIReq (I3C_HandleTypeDef * hi3c, const uint8_t * pPayload, uint8_t payloadSize, uint32_t timeout)

Function description

Target send IBI request in polling mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pPayload:** : [IN] Pointer to the buffer contains the payload data.
- **payloadSize:** : [IN] Payload buffer size in bytes.
- **timeout:** : [IN] Timeout duration in millisecond.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Tgt_IBIReq_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_IBIReq_IT (I3C_HandleTypeDef * hi3c, const uint8_t * pPayload, uint8_t payloadSize)

Function description

Target send IBI request in interrupt mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **pPayload:** : [IN] Pointer to the buffer contains the payload data.
- **payloadSize:** : [IN] Payload buffer size in bytes.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_Abort_IT

Function name

HAL_StatusTypeDef HAL_I3C_Abort_IT (I3C_HandleTypeDef * hi3c)

Function description

Abort an I3C IT or DMA process communication with Interrupt.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Status : Value from HAL_StatusTypeDef enumeration.

HAL_I3C_GetState

Function name

HAL_I3C_StateTypeDef HAL_I3C_GetState (const I3C_HandleTypeDef * hi3c)

Function description

Return the I3C handle state.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** State : [OUT] Value from HAL_I3C_StateTypeDef enumeration.

HAL_I3C_GetMode

Function name

HAL_I3C_ModeTypeDef HAL_I3C_GetMode (const I3C_HandleTypeDef * hi3c)

Function description

Returns the I3C handle mode.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **HAL:** Mode : [OUT] Value from HAL_I3C_ModeTypeDef enumeration.

HAL_I3C_GetError

Function name

uint32_t HAL_I3C_GetError (const I3C_HandleTypeDef * hi3c)

Function description

Return the I3C error code.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.

Return values

- **I3C:** Error Code : [OUT] Value from ERROR CODE DEFINITION.

HAL_I3C_GetCCCInfo

Function name

HAL_StatusTypeDef HAL_I3C_GetCCCInfo (I3C_HandleTypeDef * hi3c, uint32_t notifyId, I3C_CCCInfoTypeDef * pCCCInfo)

Function description

Target/Controller Get Common Command Code Information updated after event.

Parameters

- **hi3c:** : [IN] Pointer to an I3C_HandleTypeDef structure that contains the configuration information for the specified I3C.
- **notifyId:** : [IN] Parameter indicates which notification is signaled. It can be a combination of value of I3C Notification ID definition.
- **pCCCInfo:** : [IN/OUT] Pointer to an I3C_CCCInfoTypeDef structure that contains the CCC information updated after CCC event.

Return values

- **None:**

39.3 I3C Firmware driver defines

The following section lists the various define and macros of the module.

39.3.1 I3C

I3C

I3C BCR IN PAYLOAD

HAL_I3C_BCR_IN_PAYLOAD_SHIFT

BCR field in target payload

LL_I3C_BCR_IN_PAYLOAD_SHIFT

BCR field in target payload

I3C COMMON INTERRUPT

HAL_I3C_IT_TXFNFIE

Tx FIFO not full interrupt enable

HAL_I3C_IT_RXFNEIE

Rx FIFO not empty interrupt enable

HAL_I3C_IT_FCIE

Frame complete interrupt enable

HAL_I3C_IT_ERRIE

Error interrupt enable

HAL_I3C_ALL_COMMON_ITS

I3C CONTROLLER INTERRUPT

HAL_I3C_IT_CFNFIE

Control FIFO not full interrupt enable

HAL_I3C_IT_SFNEIE

Status FIFO not empty interrupt enable

HAL_I3C_IT_HJIE

Hot-join interrupt enable

HAL_I3C_IT_CRIE

Controller-role request interrupt enable

HAL_I3C_IT_IBIIE

IBI request interrupt enable

HAL_I3C_IT_RXTGTENDIE

Target-initiated read end interrupt enable

HAL_I3C_ALL_CTRL_ITS

CONTROL FIFO STATE

HAL_I3C_CONTROLFIFO_DISABLE

Control FIFO mode disable

HAL_I3C_CONTROLFIFO_ENABLE

Control FIFO mode enable

DIRECTION

HAL_I3C_DIRECTION_WRITE

Write transfer

HAL_I3C_DIRECTION_READ

Read transfer

HAL_I3C_DIRECTION_BOTH

Read and Write transfer

I3C DYNAMIC ADDRESS OPTION DEFINITION

I3C_RSTDAA_THEN_ENTDAA

Initiate a RSTDAA before a ENTDAA procedure

I3C_ONLY_ENTDAA

Initiate a ENTDAA without RSTDAA

ERROR CODE DEFINITION

HAL_I3C_ERROR_NONE

No error

HAL_I3C_ERROR_CE0

Controller detected an illegally formatted CCC

HAL_I3C_ERROR_CE1

Controller detected that transmitted data on the bus is different than expected

HAL_I3C_ERROR_CE2

Controller detected that broadcast address 7'h7E has been nacked

HAL_I3C_ERROR_CE3

Controller detected that new Controller did not drive the bus after Controller-role handoff

HAL_I3C_ERROR_TE0

Target detected an invalid broadcast address

HAL_I3C_ERROR_TE1

Target detected an invalid CCC Code

HAL_I3C_ERROR_TE2

Target detected a parity error during a write data

HAL_I3C_ERROR_TE3

Target detected a parity error on assigned address during dynamic address arbitration

HAL_I3C_ERROR_TE4

Target detected 7'h7E missing after Restart during Dynamic Address Assignment procedure

HAL_I3C_ERROR_TE5

Target detected an illegally formatted CCC

HAL_I3C_ERROR_TE6

Target detected that transmitted data on the bus is different than expected

HAL_I3C_ERROR_DATA_HAND_OFF

I3C data error during controller-role hand-off process

HAL_I3C_ERROR_DATA_NACK

I3C data not acknowledged error

HAL_I3C_ERROR_ADDRESS_NACK

I3C address not acknowledged error

HAL_I3C_ERROR_COVR

I3C S FIFO Over-Run or C FIFO Under-Run error

HAL_I3C_ERROR_DOVR

I3C Rx FIFO Over-Run or Tx FIFO Under-Run error

HAL_I3C_ERROR_DYNAMIC_ADDR

I3C dynamic address error

HAL_I3C_ERROR_INVALID_CALLBACK

Invalid Callback error

I3C Exported Macros

__HAL_I3C_RESET_HANDLE_STATE

Description:

- Reset I3C handle state.

Parameters:

- __HANDLE__: specifies the I3C Handle.

Return value:

- None

__HAL_I3C_ENABLE_IT

Description:

- Enable the specified I3C interrupt.

Parameters:

- __HANDLE__: specifies the I3C Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one value or a combination of the following group's values:
  - I3C CONTROLLER INTERRUPT
  - I3C TARGET INTERRUPT
  - I3C COMMON INTERRUPT

Return value:

- None

__HAL_I3C_DISABLE_IT

Description:

- Disable the specified I3C interrupt.

Parameters:

- __HANDLE__: specifies the I3C Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one value or a combination of the following group's values:
  - I3C CONTROLLER INTERRUPT
  - I3C TARGET INTERRUPT
  - I3C COMMON INTERRUPT

Return value:

- None

__HAL_I3C_GET_FLAG

Description:

- Check whether the specified I3C flag is set or not.

Parameters:

- __HANDLE__: specifies the I3C Handle.
- __FLAG__: specifies the flag to check. This parameter can be one value of the group
  - I3C FLAGS values.

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_I3C_GET_BCR

Description:

- Get Bus Characterics in payload (64bits) receive during ENTDAA procedure.

Parameters:

- __PAYLOAD__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00(uint64_t) and Max_Data=0xFFFFFFFFFFFFFFFF.

Return value:

- The: value of BCR Return value between Min_Data=0x00 and Max_Data=0xFF.

__HAL_I3C_GET_IBI_CAPABLE

Description:

- Check IBI request capabilities.

Parameters:

- __BCR__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF.

Return value:

- The: state of IBI request capabilities (ENABLE or DISABLE).

__HAL_I3C_GET_IBI_PAYLOAD

Description:

- Check IBI additional data byte capabilities.

Parameters:

- __BCR__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF.

Return value:

- The: state of IBI additional data byte capabilities (ENABLE or DISABLE).

__HAL_I3C_GET_CR_CAPABLE

Description:

- Check Controller role request capabilities.

Parameters:

- __BCR__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF.

Return value:

- The: state of Controller role request capabilities (ENABLE or DISABLE).

OPTION DEFINITION

I3C_DIRECT_WITH_DEFBYTE_RESTART

Restart between each Direct Command then Stop request for last command. Each Command have an associated defining byte

I3C_DIRECT_WITH_DEFBYTE_STOP

Stop between each Direct Command. Each Command have an associated defining byte

I3C_DIRECT_WITHOUT_DEFBYTE_RESTART

Restart between each Direct Command then Stop request for last command. Each Command have not an associated defining byte

I3C_DIRECT_WITHOUT_DEFBYTE_STOP

Stop between each Direct Command. Each Command have not an associated defining byte

I3C_BROADCAST_WITH_DEFBYTE_RESTART

Restart between each Broadcast Command then Stop request for last command. Each Command have an associated defining byte

I3C_BROADCAST_WITH_DEFBYTE_STOP

Stop between each Broadcast Command. Each Command have an associated defining byte

I3C_BROADCAST_WITHOUT_DEFBYTE_RESTART

Restart between each Broadcast Command then Stop request for last command. Each Command have not an associated defining byte

I3C_BROADCAST_WITHOUT_DEFBYTE_STOP

Stop between each Broadcast Command. Each Command have not an associated defining byte

I3C_PRIVATE_WITH_ARB_RESTART

Restart between each I3C Private message then Stop request for last message. Each Message start with an arbitration header after start bit condition

I3C_PRIVATE_WITH_ARB_STOP

Stop between each I3C Private message. Each Message start with an arbitration header after start bit condition

I3C_PRIVATE_WITHOUT_ARB_RESTART

Restart between each I3C message then Stop request for last message. Each Message start with Target address after start bit condition

I3C_PRIVATE_WITHOUT_ARB_STOP

Stop between each I3C Private message. Each Message start with Target address after start bit condition

I2C_PRIVATE_WITH_ARB_RESTART

Restart between each I2C Private message then Stop request for last message. Each Message start with an arbitration header after start bit condition

I2C_PRIVATE_WITH_ARB_STOP

Stop between each I2C Private message. Each Message start with an arbitration header after start bit condition

I2C_PRIVATE_WITHOUT_ARB_RESTART

Restart between each I2C message then Stop request for last message. Each Message start with Target address after start bit condition

I2C_PRIVATE_WITHOUT_ARB_STOP

Stop between each I2C Private message. Each Message start with Target address after start bit condition

OWN ACTIVITY STATE

HAL_I3C_OWN_ACTIVITY_STATE_0

Own Controller Activity state 0

HAL_I3C_OWN_ACTIVITY_STATE_1

Own Controller Activity state 1

HAL_I3C_OWN_ACTIVITY_STATE_2

Own Controller Activity state 2

HAL_I3C_OWN_ACTIVITY_STATE_3

Own Controller Activity state 3

PAYLOAD SIZE

HAL_I3C_PAYLOAD_EMPTY

Empty payload, no additional data after IBI acknowledge

HAL_I3C_PAYLOAD_1_BYTE

One additional data byte after IBI acknowledge

HAL_I3C_PAYLOAD_2_BYTES

Two additional data bytes after IBI acknowledge

HAL_I3C_PAYLOAD_3_BYTES

Three additional data bytes after IBI acknowledge

HAL_I3C_PAYLOAD_4_BYTES

Four additional data bytes after IBI acknowledge

RX FIFO THRESHOLD

HAL_I3C_RXFIFO_THRESHOLD_1_4

Rx Fifo Threshold is 1 byte

HAL_I3C_RXFIFO_THRESHOLD_4_4

Rx Fifo Threshold is 4 bytes

SDA HOLD TIME

HAL_I3C_SDA_HOLD_TIME_0_5

SDA hold time equal to 0.5 x ti3cclk

HAL_I3C_SDA_HOLD_TIME_1_5

SDA hold time equal to 1.5 x ti3cclk

STATUS FIFO STATE

HAL_I3C_STATUSFIFO_DISABLE

Status FIFO mode disable

HAL_I3C_STATUSFIFO_ENABLE

Status FIFO mode enable

I3C TARGET INTERRUPT

HAL_I3C_IT_IBIENDIE

IBI end interrupt enable

HAL_I3C_IT_CRUPDIE

controller-role update interrupt enable

HAL_I3C_IT_WKPIE

DEFGRPA CCC interrupt enable

HAL_I3C_ALL_TGT_ITS

TURNAROUND TIME TSCO

HAL_I3C_TURNAROUND_TIME_TSCO_LESS_12NS

clock-to-data turnaround time tSCO <= 12ns

HAL_I3C_TURNAROUND_TIME_TSCO_GREATER_12NS

clock-to-data turnaround time tSCO > 12ns

TX FIFO THRESHOLD

HAL_I3C_TXFIFO_THRESHOLD_1_4

Tx Fifo Threshold is 1 byte

HAL_I3C_TXFIFO_THRESHOLD_4_4

Tx Fifo Threshold is 4 bytes

I3C Utility Bus Type

I3C_PURE_I3C_BUS

Pure I3C bus, no I2C

I3C_MIXED_BUS

Mixed bus I3C and I2C

40 HAL ICACHE Generic Driver

40.1 ICACHE Firmware driver registers structures

40.1.1 ICACHE_RegionConfigTypeDef

ICACHE_RegionConfigTypeDef is defined in the stm32h5xx_hal_icache.h

Data Fields

- ***uint32_t BaseAddress***
- ***uint32_t RemapAddress***
- ***uint32_t Size***
- ***uint32_t TrafficRoute***
- ***uint32_t OutputBurstType***

Field Documentation

- ***uint32_t ICACHE_RegionConfigTypeDef::BaseAddress***
  Configures the Base address of Region i to be remapped
- ***uint32_t ICACHE_RegionConfigTypeDef::RemapAddress***
  Configures the Remap address of Region i to be remapped
- ***uint32_t ICACHE_RegionConfigTypeDef::Size***
  Configures the Region size. This parameter can be a value of ***ICACHE_Region_Size***
- ***uint32_t ICACHE_RegionConfigTypeDef::TrafficRoute***
  Selects the traffic route. This parameter can be a value of ***ICACHE_Traffic_Route***
- ***uint32_t ICACHE_RegionConfigTypeDef::OutputBurstType***
  Selects the output burst type. This parameter can be a value of ***ICACHE_Output_Burst_Type***

40.2 ICACHE Firmware driver API description

The following section lists the various functions of the ICACHE library.

40.2.1 ICACHE main features

The Instruction Cache (ICACHE) is introduced on C-AHB code bus of Cortex-M33 processor to improve performance when fetching instruction and data from both internal and external memories. It allows close to zero wait states performance.

- The ICACHE provides two performance counters (Hit and Miss), cache invalidate maintenance operation, error management and TrustZone security support.
- The ICACHE provides additionally the possibility to remap input address falling into up to four memory regions (used to remap aliased code in external memories to the internal Code region, for execution)
  ==========

40.2.2 How to use this driver

The ICACHE HAL driver can be used as follows:

1. Optionally configure the Instruction Cache mode with HAL_ICACHE_ConfigAssociativityMode() if the default configuration does not suit the application requirements.
2. Enable and disable the Instruction Cache with respectively HAL_ICACHE_Enable() and HAL_ICACHE_Disable(). Use HAL_ICACHE_IsEnabled() to get the Instruction Cache status.
3. Initiate the cache maintenance invalidation procedure with either HAL_ICACHE_Invalidate() (blocking mode) or HAL_ICACHE_Invalidate_IT() (interrupt mode). When interrupt mode is used, the callback function HAL_ICACHE_InvalidateCompleteCallback() is called when the invalidate procedure is complete. The function HAL_ICACHE_WaitForInvalidateComplete() may be called to wait for the end of the invalidate procedure automatically initiated when disabling the Instruction Cache with HAL_ICACHE_Disable(). The cache operation is bypassed during the invalidation procedure.

4. Use the performance monitoring counters for Hit and Miss with the following functions: HAL_ICACHE_Monitor_Start(), HAL_ICACHE_Monitor_Stop(), HAL_ICACHE_Monitor_Reset(), HAL_ICACHE_Monitor_GetHitValue() and HAL_ICACHE_Monitor_GetMissValue()
5. Enable and disable up to four regions to remap input address from external memories to the internal Code region for execution with HAL_ICACHE_EnableRemapRegion() and HAL_ICACHE_DisableRemapRegion()

40.2.3 Initialization and control functions

This section provides functions allowing to initialize and control the Instruction Cache (mode, invalidate procedure, performance counters).

This section contains the following APIs:

- ***HAL_ICACHE_ConfigAssociativityMode()***
- ***HAL_ICACHE_DeInit()***
- ***HAL_ICACHE_Enable()***
- ***HAL_ICACHE_Disable()***
- ***HAL_ICACHE_IsEnabled()***
- ***HAL_ICACHE_Invalidate()***
- ***HAL_ICACHE_Invalidate_IT()***
- ***HAL_ICACHE_WaitForInvalidateComplete()***
- ***HAL_ICACHE_Monitor_Start()***
- ***HAL_ICACHE_Monitor_Stop()***
- ***HAL_ICACHE_Monitor_Reset()***
- ***HAL_ICACHE_Monitor_GetHitValue()***
- ***HAL_ICACHE_Monitor_GetMissValue()***

40.2.4 IRQ and callback functions

This section provides functions allowing to handle ICACHE global interrupt and the associated callback functions.

This section contains the following APIs:

- ***HAL_ICACHE_IRQHandler()***
- ***HAL_ICACHE_InvalidateCompleteCallback()***
- ***HAL_ICACHE_ErrorCallback()***

40.2.5 Memory remapped regions functions

This section provides functions allowing to manage the remapping of external memories to internal Code for execution.

This section contains the following APIs:

- ***HAL_ICACHE_EnableRemapRegion()***
- ***HAL_ICACHE_DisableRemapRegion()***

40.2.6 Detailed description of functions

HAL_ICACHE_Enable

Function name

HAL_StatusTypeDef HAL_ICACHE_Enable (void)

Function description

Enable the Instruction Cache.

Return values

- **HAL:** status (HAL_OK)

Notes

- This function always returns HAL_OK even if there is any ongoing cache operation. The Instruction Cache is bypassed until the cache operation completes.

HAL_ICACHE_Disable

Function name

HAL_StatusTypeDef HAL_ICACHE_Disable (void)

Function description

Disable the Instruction Cache.

Return values

- **HAL:** status (HAL_OK/HAL_TIMEOUT)

Notes

- This function waits for the cache being disabled but not for the end of the automatic cache invalidation procedure.

HAL_ICACHE_IsEnabled

Function name

uint32_t HAL_ICACHE_IsEnabled (void)

Function description

Check whether the Instruction Cache is enabled or not.

Return values

- **Status:** (0: disabled, 1: enabled)

HAL_ICACHE_ConfigAssociativityMode

Function name

HAL_StatusTypeDef HAL_ICACHE_ConfigAssociativityMode (uint32_t AssociativityMode)

Function description

Configure the Instruction Cache cache associativity mode selection.

Parameters

- **AssociativityMode:** Associativity mode selection This parameter can be one of the following values:
  - ICACHE_1WAY 1-way cache (direct mapped cache)
  - ICACHE_2WAYS 2-ways set associative cache (default)

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

HAL_ICACHE_DeInit

Function name

HAL_StatusTypeDef HAL_ICACHE_DeInit (void)

Function description

DeInitialize the Instruction Cache.

Return values

- **HAL:** status (HAL_OK/HAL_TIMEOUT)

HAL_ICACHE_Invalidate

Function name

HAL_StatusTypeDef HAL_ICACHE_Invalidate (void)

Function description

Invalidate the Instruction Cache.

Return values

- **HAL:** status (HAL_OK/HAL_ERROR/HAL_TIMEOUT)

Notes

- This function waits for the end of cache invalidation procedure and clears the associated BSYENDF flag.

HAL_ICACHE_Invalidate_IT

Function name

HAL_StatusTypeDef HAL_ICACHE_Invalidate_IT (void)

Function description

Invalidate the Instruction Cache with interrupt.

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

Notes

- This function launches cache invalidation and returns. User application shall resort to interrupt generation to check the end of the cache invalidation with the BSYENDF flag and the HAL_ICACHE_InvalidateCompleteCallback() callback.

HAL_ICACHE_WaitForInvalidateComplete

Function name

HAL_StatusTypeDef HAL_ICACHE_WaitForInvalidateComplete (void)

Function description

Wait for the end of the Instruction Cache invalidate procedure.

Return values

- **HAL:** status (HAL_OK/HAL_TIMEOUT)

Notes

- This function checks and clears the BSYENDF flag when set.

HAL_ICACHE_Monitor_Start

Function name

HAL_StatusTypeDef HAL_ICACHE_Monitor_Start (uint32_t MonitorType)

Function description

Start the Instruction Cache performance monitoring.

Parameters

- **MonitorType:** Monitoring type This parameter can be one of the following values:
  - ICACHE_MONITOR_HIT_MISS Hit & Miss monitoring
  - ICACHE_MONITOR_HIT Hit monitoring
  - ICACHE_MONITOR_MISS Miss monitoring

Return values

- **HAL:** status (HAL_OK)

HAL_ICACHE_Monitor_Stop

Function name

HAL_StatusTypeDef HAL_ICACHE_Monitor_Stop (uint32_t MonitorType)

Function description

Stop the Instruction Cache performance monitoring.

Parameters

- **MonitorType:** Monitoring type This parameter can be one of the following values:
  - ICACHE_MONITOR_HIT_MISS Hit & Miss monitoring
  - ICACHE_MONITOR_HIT Hit monitoring
  - ICACHE_MONITOR_MISS Miss monitoring

Return values

- **HAL:** status (HAL_OK)

Notes

- Stopping the monitoring does not reset the values.

HAL_ICACHE_Monitor_Reset

Function name

HAL_StatusTypeDef HAL_ICACHE_Monitor_Reset (uint32_t MonitorType)

Function description

Reset the Instruction Cache performance monitoring values.

Parameters

- **MonitorType:** Monitoring type This parameter can be one of the following values:
  - ICACHE_MONITOR_HIT_MISS Hit & Miss monitoring
  - ICACHE_MONITOR_HIT Hit monitoring
  - ICACHE_MONITOR_MISS Miss monitoring

Return values

- **HAL:** status (HAL_OK)

HAL_ICACHE_Monitor_GetHitValue

Function name

uint32_t HAL_ICACHE_Monitor_GetHitValue (void)

Function description

Get the Instruction Cache performance Hit monitoring value.

Return values

- **Hit:** monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_ICACHE_Monitor_GetMissValue

Function name

uint32_t HAL_ICACHE_Monitor_GetMissValue (void)

Function description

Get the Instruction Cache performance Miss monitoring value.

Return values

- **Miss:** monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_ICACHE_IRQHandler

Function name

void HAL_ICACHE_IRQHandler (void)

Function description

Handle the Instruction Cache interrupt request.

Return values

- **None:**

Notes

- This function should be called under the ICACHE_IRQHandler().
- This function respectively disables the interrupt and clears the flag of any pending flag before calling the associated user callback.

HAL_ICACHE_InvalidateCompleteCallback

Function name

void HAL_ICACHE_InvalidateCompleteCallback (void)

Function description

Cache invalidation complete callback.

HAL_ICACHE_ErrorCallback

Function name

void HAL_ICACHE_ErrorCallback (void)

Function description

Error callback.

HAL_ICACHE_EnableRemapRegion

Function name

HAL_StatusTypeDef HAL_ICACHE_EnableRemapRegion (uint32_t Region, const ICACHE_RegionConfigTypeDef *const pRegionConfig)

Function description

Configure and enable a region for memory remapping.

Parameters

- **Region:** Region number This parameter can be a value of
  - Remapped Region number
- **pRegionConfig:** Pointer to structure of ICACHE region configuration parameters

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

Notes

- The Instruction Cache and the region must be disabled.

HAL_ICACHE_DisableRemapRegion

Function name

HAL_StatusTypeDef HAL_ICACHE_DisableRemapRegion (uint32_t Region)

Function description

Disable the memory remapping for a predefined region.

Parameters

- **Region:** Region number This parameter can be a value of
  - Remapped Region number

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

40.3 ICACHE Firmware driver defines

The following section lists the various define and macros of the module.

40.3.1 ICACHE

ICACHE

Flags

ICACHE_FLAG_BUSY

Busy flag

ICACHE_FLAG_BUSYEND

Busy end flag

ICACHE_FLAG_ERROR

Cache error flag

Flags and Interrupts Management

__HAL_ICACHE_ENABLE_IT

Description:

- Enable ICACHE interrupts.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt sources to be enabled. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

__HAL_ICACHE_DISABLE_IT

Description:

- Disable ICACHE interrupts.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt sources to be disabled. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

__HAL_ICACHE_GET_IT_SOURCE

Description:

- Check whether the specified ICACHE interrupt source is enabled or not.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt source to check. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

Return value:

- The: state of __INTERRUPT__ (0 or 1).

__HAL_ICACHE_GET_FLAG

Description:

- Check whether the selected ICACHE flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - ICACHE_FLAG_BUSY Busy flag
  - ICACHE_FLAG_BUSYEND Busy end flag
  - ICACHE_FLAG_ERROR Cache error flag

Return value:

- The: state of __FLAG__ (0 or 1).

__HAL_ICACHE_CLEAR_FLAG

Description:

- Clear the selected ICACHE flags.

Parameters:

- __FLAG__: specifies the ICACHE flags to clear. This parameter can be any combination of the following values:
  - ICACHE_FLAG_BUSYEND Busy end flag
  - ICACHE_FLAG_ERROR Cache error flag

Interrupts

ICACHE_IT_BUSYEND

Busy end interrupt

ICACHE_IT_ERROR

Cache error interrupt

Monitor type

ICACHE_MONITOR_HIT_MISS

Hit & Miss monitoring

ICACHE_MONITOR_HIT

Hit monitoring

ICACHE_MONITOR_MISS

Miss monitoring

Remapped Output burst type

ICACHE_OUTPUT_BURST_WRAP

WRAP

ICACHE_OUTPUT_BURST_INCR

INCR

Remapped Region number

ICACHE_REGION_0

Region 0

ICACHE_REGION_1

Region 1

ICACHE_REGION_2

Region 2

ICACHE_REGION_3

ICACHE_REGIONSIZE_2MB

Region size 2MB

ICACHE_REGIONSIZE_4MB

Region size 4MB

ICACHE_REGIONSIZE_8MB

Region size 8MB

ICACHE_REGIONSIZE_16MB

Region size 16MB

ICACHE_REGIONSIZE_32MB

Region size 32MB

ICACHE_REGIONSIZE_64MB

Region size 64MB

ICACHE_REGIONSIZE_128MB

Region size 128MB

Remapped Traffic route

ICACHE_MASTER1_PORT

Master1 port

ICACHE_MASTER2_PORT

Master2 port

Ways selection

ICACHE_1WAY

1-way cache (direct mapped cache)

ICACHE_2WAYS

2-ways set associative cache (default)

41 HAL IRDA Generic Driver

41.1 IRDA Firmware driver registers structures

41.1.1 IRDA_InitTypeDef

IRDA_InitTypeDef is defined in the stm32h5xx_hal_irda.h

Data Fields

- ***uint32_t BaudRate***
- ***uint32_t WordLength***
- ***uint32_t Parity***
- ***uint32_t Mode***
- ***uint8_t Prescaler***
- ***uint16_t PowerMode***
- ***uint32_t ClockPrescaler***

Field Documentation

- ***uint32_t IRDA_InitTypeDef::BaudRate***
  This member configures the IRDA communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((usart_ker_ckpres) / ((hirda->Init.BaudRate))) where usart_ker_ckpres is the IRDA input clock divided by a prescaler
- ***uint32_t IRDA_InitTypeDef::WordLength***
  Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of ***IRDAEx_Word_Length***
- ***uint32_t IRDA_InitTypeDef::Parity***
  Specifies the parity mode. This parameter can be a value of ***IRDA_Parity***
  Note:
  – When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).
- ***uint32_t IRDA_InitTypeDef::Mode***
  Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of ***IRDA_Transfer_Mode***
- ***uint8_t IRDA_InitTypeDef::Prescaler***
  Specifies the Prescaler value for dividing the UART/USART source clock to achieve low-power frequency.
  Note:
  – Prescaler value 0 is forbidden
- ***uint16_t IRDA_InitTypeDef::PowerMode***
  Specifies the IRDA power mode. This parameter can be a value of ***IRDA_Low_Power***
- ***uint32_t IRDA_InitTypeDef::ClockPrescaler***
  Specifies the prescaler value used to divide the IRDA clock source. This parameter can be a value of ***IRDA_ClockPrescaler***.

41.1.2 __IRDA_HandleTypeDef

__IRDA_HandleTypeDef is defined in the stm32h5xx_hal_irda.h

Data Fields

- ***USART_TypeDef * Instance***
- ***IRDA_InitTypeDef Init***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferSize***
- ***__IO uint16_t TxXferCount***
- ***uint8_t * pRxBuffPtr***
- ***uint16_t RxXferSize***
- ***__IO uint16_t RxXferCount***

- ***uint16_t Mask***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_IRDA_StateTypeDef gState***
- ***__IO HAL_IRDA_StateTypeDef RxState***
- ***__IO uint32_t ErrorCode***
- ***void(* TxHalfCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* AbortTransmitCpltCallback***
- ***void(* AbortReceiveCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***USART_TypeDef* __IRDA_HandleTypeDef::Instance***
  USART registers base address
- ***IRDA_InitTypeDef __IRDA_HandleTypeDef::Init***
  IRDA communication parameters
- ***const uint8_t* __IRDA_HandleTypeDef::pTxBuffPtr***
  Pointer to IRDA Tx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::TxXferSize***
  IRDA Tx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::TxXferCount***
  IRDA Tx Transfer Counter
- ***uint8_t* __IRDA_HandleTypeDef::pRxBuffPtr***
  Pointer to IRDA Rx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::RxXferSize***
  IRDA Rx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::RxXferCount***
  IRDA Rx Transfer Counter
- ***uint16_t __IRDA_HandleTypeDef::Mask***
  USART RX RDR register mask
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmatx***

  IRDA Abort Transmit Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortReceiveCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Receive Complete Callback
- ***void(* __IRDA_HandleTypeDef::MspInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp Init callback
- ***void(* __IRDA_HandleTypeDef::MspDeInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp DeInit callback

41.2 IRDA Firmware driver API description

The following section lists the various functions of the IRDA library.

41.2.1 How to use this driver

The IRDA HAL driver can be used as follows:

1. Declare a IRDA_HandleTypeDef handle structure (eg. IRDA_HandleTypeDef hirda).
2. Initialize the IRDA low level resources by implementing the HAL_IRDA_MspInit() API in setting the associated USART or UART in IRDA mode:
   - Enable the USARTx/UARTx interface clock.
   - USARTx/UARTx pins configuration:
     - Enable the clock for the USARTx/UARTx GPIOs.
     - Configure these USARTx/UARTx pins (TX as alternate function pull-up, RX as alternate function Input).
   - NVIC configuration if you need to use interrupt process (HAL_IRDA_Transmit_IT() and HAL_IRDA_Receive_IT() APIs):
     - Configure the USARTx/UARTx interrupt priority.
     - Enable the NVIC USARTx/UARTx IRQ handle.
     - The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.
   - DMA Configuration if you need to use DMA process (HAL_IRDA_Transmit_DMA() and HAL_IRDA_Receive_DMA() APIs):
     - Declare a DMA handle structure for the Tx/Rx channel.
     - Enable the DMAx interface clock.
     - Configure the declared DMA handle structure with the required Tx/Rx parameters.
     - Configure the DMA Tx/Rx channel.
     - Associate the initialized DMA handle to the IRDA DMA Tx/Rx handle.
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length and Parity and Mode(Receiver/Transmitter), the normal or low power mode and the clock prescaler in the hirda handle Init structure.

4. Initialize the IRDA registers by calling the HAL_IRDA_Init() API:
   – This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_IRDA_MspInit() API.

Note: The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.

5. Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_IRDA_Transmit()
- Receive an amount of data in blocking mode using HAL_IRDA_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_IRDA_Transmit_IT()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_IRDA_Receive_IT()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_IRDA_Transmit_DMA()
- At transmission half of transfer HAL_IRDA_TxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxHalfCpltCallback()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_IRDA_Receive_DMA()
- At reception half of transfer HAL_IRDA_RxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxHalfCpltCallback()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

IRDA HAL driver macros list

Below the list of most used macros in IRDA HAL driver.

- __HAL_IRDA_ENABLE: Enable the IRDA peripheral
- __HAL_IRDA_DISABLE: Disable the IRDA peripheral
- __HAL_IRDA_GET_FLAG : Check whether the specified IRDA flag is set or not
- __HAL_IRDA_CLEAR_FLAG : Clear the specified IRDA pending flag
- __HAL_IRDA_ENABLE_IT: Enable the specified IRDA interrupt
- __HAL_IRDA_DISABLE_IT: Disable the specified IRDA interrupt
- __HAL_IRDA_GET_IT_SOURCE: Check whether or not the specified IRDA interrupt is enabled

Note: You can refer to the IRDA HAL driver header file for more useful macros

41.2.2 Callback registration

The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_IRDA_RegisterCallback() to register a user callback. Function HAL_IRDA_RegisterCallback() allows to register following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_IRDA_UnRegisterCallback() to reset a callback to the default weak function. HAL_IRDA_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit.

By default, after the HAL_IRDA_Init() and when the state is HAL_IRDA_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxHalfCpltCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak functions in the HAL_IRDA_Init() and HAL_IRDA_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_IRDA_Init() and HAL_IRDA_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_IRDA_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_IRDA_STATE_READY or HAL_IRDA_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_IRDA_RegisterCallback() before calling HAL_IRDA_DeInit() or HAL_IRDA_Init() function.

When The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak callbacks are used.

41.2.3 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx in asynchronous IRDA mode.

- For the asynchronous mode only these parameters can be configured:
  - Baud Rate
  - Word Length
  - Parity: If the parity is enabled, then the MSB bit of the data written in the data register is transmitted but is changed by the parity bit.
  - Power mode
  - Prescaler setting
  - Receiver/transmitter modes

The HAL_IRDA_Init() API follows the USART asynchronous configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- ***HAL_IRDA_Init()***

- *HAL_IRDA_DeInit()*
- *HAL_IRDA_MspInit()*
- *HAL_IRDA_MspDeInit()*
- *HAL_IRDA_RegisterCallback()*
- *HAL_IRDA_UnRegisterCallback()*

41.2.4 IO operation functions

This subsection provides a set of functions allowing to manage the IRDA data transfers.

IrDA is a half duplex communication protocol. If the Transmitter is busy, any data on the IrDA receive line will be ignored by the IrDA decoder and if the Receiver is busy, data on the TX from the USART to IrDA will not be encoded by IrDA. While receiving data, transmission should be avoided as the data to be transmitted could be corrupted.

1. There are two modes of transfer:
   - Blocking mode: the communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
   - Non-Blocking mode: the communication is performed using Interrupts or DMA, these API's return the HAL status. The end of the data processing will be indicated through the dedicated IRDA IRQ when using Interrupt mode or the DMA IRQ when using DMA mode. The HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxCpltCallback() user callbacks will be executed respectively at the end of the Transmit or Receive process The HAL_IRDA_ErrorCallback() user callback will be executed when a communication error is detected
2. Blocking mode APIs are :
   - HAL_IRDA_Transmit()
   - HAL_IRDA_Receive()
3. Non Blocking mode APIs with Interrupt are :
   - HAL_IRDA_Transmit_IT()
   - HAL_IRDA_Receive_IT()
   - HAL_IRDA_IRQHandler()
4. Non Blocking mode functions with DMA are :
   - HAL_IRDA_Transmit_DMA()
   - HAL_IRDA_Receive_DMA()
   - HAL_IRDA_DMAPause()
   - HAL_IRDA_DMAResume()
   - HAL_IRDA_DMAStop()
5. A set of Transfer Complete Callbacks are provided in Non Blocking mode:
   - HAL_IRDA_TxHalfCpltCallback()
   - HAL_IRDA_TxCpltCallback()
   - HAL_IRDA_RxHalfCpltCallback()
   - HAL_IRDA_RxCpltCallback()
   - HAL_IRDA_ErrorCallback()
6. Non-Blocking mode transfers could be aborted using Abort API's :
   - HAL_IRDA_Abort()
   - HAL_IRDA_AbortTransmit()
   - HAL_IRDA_AbortReceive()
   - HAL_IRDA_Abort_IT()
   - HAL_IRDA_AbortTransmit_IT()
   - HAL_IRDA_AbortReceive_IT()
7. For Abort services based on interrupts (HAL_IRDA_Abortxxx_IT), a set of Abort Complete Callbacks are provided:
   - HAL_IRDA_AbortCpltCallback()
   - HAL_IRDA_AbortTransmitCpltCallback()
   - HAL_IRDA_AbortReceiveCpltCallback()

8. In Non-Blocking mode transfers, possible errors are split into 2 categories. Errors are handled as follows :
   – Error is considered as Recoverable and non blocking : Transfer could go till end, but error severity is to be evaluated by user : this concerns Frame Error, Parity Error or Noise Error in Interrupt mode reception . Received character is then retrieved and stored in Rx buffer, Error code is set to allow user to identify error type, and HAL_IRDA_ErrorCallback() user callback is executed. Transfer is kept ongoing on IRDA side. If user wants to abort it, Abort services should be called by user.
   – Error is considered as Blocking : Transfer could not be completed properly and is aborted. This concerns Overrun Error In Interrupt mode reception and all errors in DMA mode. Error code is set to allow user to identify error type, and HAL_IRDA_ErrorCallback() user callback is executed.

This section contains the following APIs:

- *HAL_IRDA_Transmit()*
- *HAL_IRDA_Receive()*
- *HAL_IRDA_Transmit_IT()*
- *HAL_IRDA_Receive_IT()*
- *HAL_IRDA_Transmit_DMA()*
- *HAL_IRDA_Receive_DMA()*
- *HAL_IRDA_DMAPause()*
- *HAL_IRDA_DMAResume()*
- *HAL_IRDA_DMAStop()*
- *HAL_IRDA_Abort()*
- *HAL_IRDA_AbortTransmit()*
- *HAL_IRDA_AbortReceive()*
- *HAL_IRDA_Abort_IT()*
- *HAL_IRDA_AbortTransmit_IT()*
- *HAL_IRDA_AbortReceive_IT()*
- *HAL_IRDA_IRQHandler()*
- *HAL_IRDA_TxCpltCallback()*
- *HAL_IRDA_TxHalfCpltCallback()*
- *HAL_IRDA_RxCpltCallback()*
- *HAL_IRDA_RxHalfCpltCallback()*
- *HAL_IRDA_ErrorCallback()*
- *HAL_IRDA_AbortCpltCallback()*
- *HAL_IRDA_AbortTransmitCpltCallback()*
- *HAL_IRDA_AbortReceiveCpltCallback()*

41.2.5 Peripheral State and Error functions

This subsection provides a set of functions allowing to return the State of IrDA communication process and also return Peripheral Errors occurred during communication process

- HAL_IRDA_GetState() API can be helpful to check in run-time the state of the IRDA peripheral handle.
- HAL_IRDA_GetError() checks in run-time errors that could occur during communication.

This section contains the following APIs:

- *HAL_IRDA_GetState()*
- *HAL_IRDA_GetError()*

41.2.6 Detailed description of functions

HAL_IRDA_Init

Function name

HAL_StatusTypeDef HAL_IRDA_Init (IRDA_HandleTypeDef * hirda)

Function description

Initialize the IRDA mode according to the specified parameters in the IRDA_InitTypeDef and initialize the associated handle.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_DeInit

Function name

HAL_StatusTypeDef HAL_IRDA_DeInit (IRDA_HandleTypeDef * hirda)

Function description

DeInitialize the IRDA peripheral.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_MspInit

Function name

void HAL_IRDA_MspInit (IRDA_HandleTypeDef * hirda)

Function description

Initialize the IRDA MSP.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_MspDeInit

Function name

void HAL_IRDA_MspDeInit (IRDA_HandleTypeDef * hirda)

Function description

DeInitialize the IRDA MSP.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_IRDA_RegisterCallback (IRDA_HandleTypeDef * hirda, HAL_IRDA_CallbackIDTypeDef CallbackID, pIRDA_CallbackTypeDef pCallback)

Function description

Register a User IRDA Callback To be used to override the weak predefined callback.

Parameters

- **hirda:** irda handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_IRDA_TX_HALFCOMPLETE_CB_ID Tx Half Complete Callback ID
  - HAL_IRDA_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_IRDA_RX_HALFCOMPLETE_CB_ID Rx Half Complete Callback ID
  - HAL_IRDA_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_IRDA_ERROR_CB_ID Error Callback ID
  - HAL_IRDA_ABORT_COMPLETE_CB_ID Abort Complete Callback ID
  - HAL_IRDA_ABORT_TRANSMIT_COMPLETE_CB_ID Abort Transmit Complete Callback ID
  - HAL_IRDA_ABORT_RECEIVE_COMPLETE_CB_ID Abort Receive Complete Callback ID
  - HAL_IRDA_MSPINIT_CB_ID MspInit Callback ID
  - HAL_IRDA_MSPDEINIT_CB_ID MspDeInit Callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_IRDA_RegisterCallback() may be called before HAL_IRDA_Init() in HAL_IRDA_STATE_RESET to register callbacks for HAL_IRDA_MSPINIT_CB_ID and HAL_IRDA_MSPDEINIT_CB_ID

HAL_IRDA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_IRDA_UnRegisterCallback (IRDA_HandleTypeDef * hirda, HAL_IRDA_CallbackIDTypeDef CallbackID)

Function description

Unregister an IRDA callback IRDA callback is redirected to the weak predefined callback.

Parameters

- **hirda:** irda handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_IRDA_TX_HALFCOMPLETE_CB_ID Tx Half Complete Callback ID
  - HAL_IRDA_TX_COMPLETE_CB_ID Tx Complete Callback ID
  - HAL_IRDA_RX_HALFCOMPLETE_CB_ID Rx Half Complete Callback ID
  - HAL_IRDA_RX_COMPLETE_CB_ID Rx Complete Callback ID
  - HAL_IRDA_ERROR_CB_ID Error Callback ID
  - HAL_IRDA_ABORT_COMPLETE_CB_ID Abort Complete Callback ID
  - HAL_IRDA_ABORT_TRANSMIT_COMPLETE_CB_ID Abort Transmit Complete Callback ID
  - HAL_IRDA_ABORT_RECEIVE_COMPLETE_CB_ID Abort Receive Complete Callback ID
  - HAL_IRDA_MSPINIT_CB_ID MspInit Callback ID
  - HAL_IRDA_MSPDEINIT_CB_ID MspDeInit Callback ID

Return values

- **HAL:** status

Notes

- The HAL_IRDA_UnRegisterCallback() may be called before HAL_IRDA_Init() in HAL_IRDA_STATE_RESET to un-register callbacks for HAL_IRDA_MSPINIT_CB_ID and HAL_IRDA_MSPDEINIT_CB_ID

HAL_IRDA_Transmit

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Send an amount of data in blocking mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.
- **Timeout:** Specify timeout value.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive

Function name

HAL_StatusTypeDef HAL_IRDA_Receive (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.
- **Timeout:** Specify timeout value.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Transmit_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit_IT (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size)

Function description

Send an amount of data in interrupt mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Receive_IT (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size)

Function description

Receive an amount of data in interrupt mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit_DMA (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size)

Function description

Send an amount of data in DMA mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive_DMA

Function name

HAL_StatusTypeDef HAL_IRDA_Receive_DMA (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size)

Function description

Receive an amount of data in DMA mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.
- When the IRDA parity is enabled (PCE = 1), the received data contains the parity bit (MSB position).

HAL_IRDA_DMAPause

Function name

HAL_StatusTypeDef HAL_IRDA_DMAPause (IRDA_HandleTypeDef * hirda)

Function description

Pause the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_DMAResume

Function name

HAL_StatusTypeDef HAL_IRDA_DMAResume (IRDA_HandleTypeDef * hirda)

Function description

Resume the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

HAL_IRDA_DMAStop

Function name

HAL_StatusTypeDef HAL_IRDA_DMAStop (IRDA_HandleTypeDef * hirda)

Function description

Stop the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

HAL_IRDA_Abort

Function name

HAL_StatusTypeDef HAL_IRDA_Abort (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing transfers (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_AbortTransmit

Function name

HAL_StatusTypeDef HAL_IRDA_AbortTransmit (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Transmit transfer (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Tx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_AbortReceive

Function name

HAL_StatusTypeDef HAL_IRDA_AbortReceive (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Receive transfer (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_Abort_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Abort_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing transfers (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_AbortTransmit_IT

Function name

HAL_StatusTypeDef HAL_IRDA_AbortTransmit_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Transmit transfer (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Tx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_AbortReceive_IT

Function name

HAL_StatusTypeDef HAL_IRDA_AbortReceive_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Receive transfer (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_IRQHandler

Function name

void HAL_IRDA_IRQHandler (IRDA_HandleTypeDef * hirda)

Function description

Handle IRDA interrupt request.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_TxCpltCallback

Function name

void HAL_IRDA_TxCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Tx Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_RxCpltCallback

Function name

void HAL_IRDA_RxCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Rx Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_TxHalfCpltCallback

Function name

void HAL_IRDA_TxHalfCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Tx Half Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified USART module.

Return values

- **None:**

HAL_IRDA_RxHalfCpltCallback

Function name

void HAL_IRDA_RxHalfCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Rx Half Transfer complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_ErrorCallback

Function name

void HAL_IRDA_ErrorCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA error callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortCpltCallback

Function name

void HAL_IRDA_AbortCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortTransmitCpltCallback

Function name

void HAL_IRDA_AbortTransmitCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortReceiveCpltCallback

Function name

void HAL_IRDA_AbortReceiveCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Receive Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_GetState

Function name

HAL_IRDA_StateTypeDef HAL_IRDA_GetState (const IRDA_HandleTypeDef * hirda)

Function description

Return the IRDA handle state.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** state

HAL_IRDA_GetError

Function name

uint32_t HAL_IRDA_GetError (const IRDA_HandleTypeDef * hirda)

Function description

Return the IRDA handle error code.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **IRDA:** Error Code

41.3 IRDA Firmware driver defines

The following section lists the various define and macros of the module.

41.3.1 IRDA

IRDA Exported Macros

__HAL_IRDA_RESET_HANDLE_STATE

Description:

- Reset IRDA handle state.

Parameters:

- __HANDLE__: IRDA handle.

Return value:

- None

__HAL_IRDA_FLUSH_DRREGISTER

Description:

- Flush the IRDA DR register.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FLAG

Description:

- Clear the specified IRDA pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - IRDA_CLEAR_PEF
  - IRDA_CLEAR_FEF
  - IRDA_CLEAR_NEF
  - IRDA_CLEAR_OREF
  - IRDA_CLEAR_TCF
  - IRDA_CLEAR_IDLEF

Return value:

- None

__HAL_IRDA_CLEAR_PEFLAG

Description:

- Clear the IRDA PE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FEFLAG

Description:

- Clear the IRDA FE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_NEFLAG

Description:

- Clear the IRDA NE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_OREFLAG

Description:

- Clear the IRDA ORE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_IDLEFLAG

Description:

- Clear the IRDA IDLE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_GET_FLAG

Description:

- Check whether the specified IRDA flag is set or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - IRDA_FLAG_REACK Receive enable acknowledge flag
  - IRDA_FLAG_TEACK Transmit enable acknowledge flag
  - IRDA_FLAG_BUSY Busy flag
  - IRDA_FLAG_ABRF Auto Baud rate detection flag
  - IRDA_FLAG_ABRE Auto Baud rate detection error flag
  - IRDA_FLAG_TXE Transmit data register empty flag
  - IRDA_FLAG_TC Transmission Complete flag
  - IRDA_FLAG_RXNE Receive data register not empty flag
  - IRDA_FLAG_ORE OverRun Error flag
  - IRDA_FLAG_NE Noise Error flag
  - IRDA_FLAG_FE Framing Error flag
  - IRDA_FLAG_PE Parity Error flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_IRDA_ENABLE_IT

Description:

- Enable the specified IRDA interrupt.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to enable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:

- None

__HAL_IRDA_DISABLE_IT

Description:

- Disable the specified IRDA interrupt.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to disable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:

- None

__HAL_IRDA_GET_IT

Description:

- Check whether the specified IRDA interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ORE OverRun Error interrupt
  - IRDA_IT_NE Noise Error interrupt
  - IRDA_IT_FE Framing Error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:

- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_GET_IT_SOURCE

Description:

- Check whether the specified IRDA interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ERR Framing, overrun or noise error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:

- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_CLEAR_IT

Description:

- Clear the specified IRDA ISR flag, in setting the proper ICR register flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __IT_CLEAR__: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt This parameter can be one of the following values:
  - IRDA_CLEAR_PEF Parity Error Clear Flag
  - IRDA_CLEAR_FEF Framing Error Clear Flag
  - IRDA_CLEAR_NEF Noise detected Clear Flag
  - IRDA_CLEAR_OREF OverRun Error Clear Flag
  - IRDA_CLEAR_TCF Transmission Complete Clear Flag

Return value:

- None

__HAL_IRDA_SEND_REQ

Description:

- Set a specific IRDA request flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __REQ__: specifies the request flag to set This parameter can be one of the following values:
  - IRDA_AUTOBAUD_REQUEST Auto-Baud Rate Request
  - IRDA_RXDATA_FLUSH_REQUEST Receive Data flush Request
  - IRDA_TXDATA_FLUSH_REQUEST Transmit data flush Request

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_ENABLE

Description:

- Enable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_DISABLE

Description:

- Disable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ENABLE

Description:

- Enable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_DISABLE

Description:

- Disable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

42 HAL IRDA Extension Driver

42.1 IRDAEx Firmware driver defines

The following section lists the various define and macros of the module.

42.1.1 IRDAEx

IRDAEx

IRDAEx Word Length

IRDA_WORDLENGTH_7B

7-bit long frame

IRDA_WORDLENGTH_8B

8-bit long frame

IRDA_WORDLENGTH_9B

9-bit long frame

43 HAL IWDG Generic Driver

43.1 IWDG Firmware driver registers structures

43.1.1 IWDG_InitTypeDef

IWDG_InitTypeDef is defined in the stm32h5xx_hal_iwdg.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t Reload***
- ***uint32_t Window***
- ***uint32_t EWI***

Field Documentation

- ***uint32_t IWDG_InitTypeDef::Prescaler***
  Select the prescaler of the IWDG. This parameter can be a value of ***IWDG_Prescaler***
- ***uint32_t IWDG_InitTypeDef::Reload***
  Specifies the IWDG down-counter reload value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::Window***
  Specifies the window value to be compared to the down-counter. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::EWI***
  Specifies if IWDG Early Wakeup Interrupt is enable or not and the comparator value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF value 0 means that EWI is disabled

43.1.2 __IWDG_HandleTypeDef

__IWDG_HandleTypeDef is defined in the stm32h5xx_hal_iwdg.h

Data Fields

- ***IWDG_TypeDef * Instance***
- ***IWDG_InitTypeDef Init***
- ***void(* EwiCallback***
- ***void(* MspInitCallback***

Field Documentation

- ***IWDG_TypeDef* __IWDG_HandleTypeDef::Instance***
  Register base address
- ***IWDG_InitTypeDef __IWDG_HandleTypeDef::Init***
  IWDG required parameters
- ***void(* __IWDG_HandleTypeDef::EwiCallback)(struct __IWDG_HandleTypeDef *hiwdg)***
  IWDG Early WakeUp Interrupt callback
- ***void(* __IWDG_HandleTypeDef::MspInitCallback)(struct __IWDG_HandleTypeDef *hiwdg)***
  IWDG Msp Init callback

43.2 IWDG Firmware driver API description

The following section lists the various functions of the IWDG library.

43.2.1 IWDG Generic features

- The IWDG can be started by either software or hardware (configurable through option byte).
- The IWDG is clocked by the Low-Speed Internal clock (LSI) and thus stays active even if the main clock fails.

- Once the IWDG is started, the LSI is forced ON and both cannot be disabled. The counter starts counting down from the reset value (0xFFF). When it reaches the end of count value (0x000) a reset signal is generated (IWDG reset).
- Whenever the key value 0x0000 AAAA is written in the IWDG_KR register, the IWDG_RLR value is reloaded into the counter and the watchdog reset is prevented.
- The IWDG is implemented in the VDD voltage domain that is still functional in STOP and STANDBY mode (IWDG reset can wake up the CPU from STANDBY). IWDGRST flag in RCC_CSR register can be used to inform when an IWDG reset occurs.
- Debug mode: When the microcontroller enters debug mode (core halted), the IWDG counter either continues to work normally or stops, depending on DBG_IWDG_STOP configuration bit in DBG module, accessible through __HAL_DBGMCU_FREEZE_IWDG() and __HAL_DBGMCU_UNFREEZE_IWDG() macros.

Min-max timeout value @32KHz (LSI): ~125us / ~131.04s The IWDG timeout may vary due to LSI clock frequency dispersion. STM32H5xx devices provide the capability to measure the LSI clock frequency (LSI clock is internally connected to TIM16 CH1 input capture). The measured value can be used to have an IWDG timeout with an acceptable accuracy.

Default timeout value (necessary for IWDG_SR status register update): Constant LSI_VALUE is defined based on the nominal LSI clock frequency. This frequency being subject to variations as mentioned above, the default timeout value (defined through constant HAL_IWDG_DEFAULT_TIMEOUT below) may become too short or too long. In such cases, this default timeout value can be tuned by redefining the constant LSI_VALUE at user-application level (based, for instance, on the measured LSI clock frequency as explained above).

43.2.2 How to use this driver

1. Register callback to treat Iwdg interrupt and MspInit using HAL_IWDG_RegisterCallback().
   - Provide exiting handle as first parameter.
   - Provide which callback will be registered using one value from HAL_IWDG_CallbackIDTypeDef.
   - Provide callback function pointer.
2. Use IWDG using HAL_IWDG_Init() function to :
   - Enable instance by writing Start keyword in IWDG_KEY register. LSI clock is forced ON and IWDG counter starts counting down.
   - Enable write access to configuration registers: IWDG_PR, IWDG_RLR, IWDG_WINR and EWCR.
   - Configure the IWDG prescaler and counter reload value. This reload value will be loaded in the IWDG counter each time the watchdog is reloaded, then the IWDG will start counting down from this value.
   - Depending on window parameter:
     - If Window Init parameter is same as Window register value, nothing more is done but reload counter value in order to exit function with exact time base.
     - Else modify Window register. This will automatically reload watchdog counter.
   - Depending on Early Wakeup Interrupt parameter:
     - If EWI is set to disable, comparator is set to 0, interrupt is disable & flag is clear.
     - Else modify EWCR register, setting comparator value, enable interrupt & clear flag.
   - Wait for status flags to be reset.
3. Then the application program must refresh the IWDG counter at regular intervals during normal operation to prevent an MCU reset, using HAL_IWDG_Refresh() function.

IWDG HAL driver macros list

Below the list of most used macros in IWDG HAL driver:

- __HAL_IWDG_START: Enable the IWDG peripheral
- __HAL_IWDG_RELOAD_COUNTER: Reloads IWDG counter with value defined in the reload register

43.2.3 Initialization and Start functions

This section provides functions allowing to:

- Initialize the IWDG according to the specified parameters in the IWDG_InitTypeDef of associated handle.
- Manage Window option.

- Once initialization is performed in HAL_IWDG_Init function, Watchdog is reloaded in order to exit function with correct time base.

This section contains the following APIs:

- ***HAL_IWDG_Init()***
- ***HAL_IWDG_MspInit()***
- ***HAL_IWDG_RegisterCallback()***
- ***HAL_IWDG_UnRegisterCallback()***

43.2.4 IO operation functions

This section provides functions allowing to:

- Refresh the IWDG.

This section contains the following APIs:

- ***HAL_IWDG_Refresh()***
- ***HAL_IWDG_GetActiveStatus()***
- ***HAL_IWDG_IRQHandler()***
- ***HAL_IWDG_EarlyWakeupCallback()***

43.2.5 Detailed description of functions

HAL_IWDG_Init

Function name

HAL_StatusTypeDef HAL_IWDG_Init (IWDG_HandleTypeDef * hiwdg)

Function description

Initialize the IWDG according to the specified parameters in the IWDG_InitTypeDef and start watchdog.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **HAL:** status

HAL_IWDG_MspInit

Function name

void HAL_IWDG_MspInit (IWDG_HandleTypeDef * hiwdg)

Function description

Initialize the IWDG MSP.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **None:**

Notes

- When rewriting this function in user file, mechanism may be added to avoid multiple initialize when HAL_IWDG_Init function is called again to change parameters.

HAL_IWDG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_IWDG_RegisterCallback (IWDG_HandleTypeDef * hiwdg, HAL_IWDG_CallbackIDTypeDef CallbackID, pIWDG_CallbackTypeDef pCallback)

Function description

Register a User IWDG Callback To be used instead of the weak predefined callback.

Parameters

- **hiwdg:** IWDG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_IWDG_EWI_CB_ID Early WakeUp Interrupt Callback ID
  - HAL_IWDG_MSPINIT_CB_ID MspInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_IWDG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_IWDG_UnRegisterCallback (IWDG_HandleTypeDef * hiwdg, HAL_IWDG_CallbackIDTypeDef CallbackID)

Function description

Unregister a IWDG Callback IWDG Callback is redirected to the weak predefined callback.

Parameters

- **hiwdg:** IWDG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_IWDG_EWI_CB_ID Early WakeUp Interrupt Callback ID
  - HAL_IWDG_MSPINIT_CB_ID MspInit callback ID

Return values

- **status:**

HAL_IWDG_Refresh

Function name

HAL_StatusTypeDef HAL_IWDG_Refresh (IWDG_HandleTypeDef * hiwdg)

Function description

Refresh the IWDG.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **HAL:** status

HAL_IWDG_GetActiveStatus

Function name

uint32_t HAL_IWDG_GetActiveStatus (const IWDG_HandleTypeDef * hiwdg)

Function description

Get back IWDG running status.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **can:** be one of following value :
  - IWDG_STATUS_DISABLE
  - IWDG_STATUS_ENABLE

Notes

- This API allows to know if IWDG has been started by other master, thread or by hardware.

HAL_IWDG_IRQHandler

Function name

void HAL_IWDG_IRQHandler (IWDG_HandleTypeDef * hiwdg)

Function description

Handle IWDG interrupt request.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **None:**

Notes

- The Early Wakeup Interrupt (EWI) can be used if specific safety operations or data logging must be performed before the actual reset is generated. The EWI interrupt is enabled by calling HAL_IWDG_Init function with EWIMode set to IWDG_EWI_ENABLE. When the downcounter reaches the value 0x40, and EWI interrupt is generated and the corresponding Interrupt Service Routine (ISR) can be used to trigger specific actions (such as communications or data logging), before resetting the device.

HAL_IWDG_EarlyWakeupCallback

Function name

void HAL_IWDG_EarlyWakeupCallback (IWDG_HandleTypeDef * hiwdg)

Function description

IWDG Early Wakeup callback.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **None:**

43.3 IWDG Firmware driver defines

The following section lists the various define and macros of the module.

43.3.1 IWDG

IWDG

IWDG Active Status

IWDG_STATUS_DISABLE

IWDG_STATUS_ENABLE

IWDG Early Wakeup Interrupt Mode

IWDG_EWI_DISABLE

EWI Disable

IWDG Exported Macros

__HAL_IWDG_START

Description:

- Enable the IWDG peripheral.

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

__HAL_IWDG_RELOAD_COUNTER

Description:

- Reload IWDG counter with value defined in the reload register (write access to IWDG_PR, IWDG_RLR, IWDG_WINR and EWCR registers disabled).

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

IWDG Prescaler

IWDG_PRESCALER_4

IWDG prescaler set to 4

IWDG_PRESCALER_8

IWDG prescaler set to 8

IWDG_PRESCALER_16

IWDG prescaler set to 16

IWDG_PRESCALER_32

IWDG prescaler set to 32

IWDG_PRESCALER_64

IWDG prescaler set to 64

IWDG_PRESCALER_128

IWDG prescaler set to 128

IWDG_PRESCALER_256

IWDG prescaler set to 256

IWDG_PRESCALER_512

IWDG prescaler set to 512

IWDG_PRESCALER_1024

IWDG prescaler set to 1024

IWDG Window option

IWDG_WINDOW_DISABLE

44 HAL LPTIM Generic Driver

44.1 LPTIM Firmware driver registers structures

44.1.1 LPTIM_ClockConfigTypeDef

LPTIM_ClockConfigTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Prescaler***

Field Documentation

- ***uint32_t LPTIM_ClockConfigTypeDef::Source***
  Selects the clock source. This parameter can be a value of ***LPTIM_Clock_Source***
- ***uint32_t LPTIM_ClockConfigTypeDef::Prescaler***
  Specifies the counter clock Prescaler. This parameter can be a value of ***LPTIM_Clock_Prescaler***

44.1.2 LPTIM_ULPClockConfigTypeDef

LPTIM_ULPClockConfigTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***uint32_t Polarity***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_ULPClockConfigTypeDef::Polarity***
  Selects the polarity of the active edge for the counter unit if the ULPTIM input is selected. Note: This parameter is used only when Ultra low power clock source is used. Note: If the polarity is configured on 'both edges', an auxiliary clock (one of the Low power oscillator) must be active. This parameter can be a value of ***LPTIM_Clock_Polarity***
- ***uint32_t LPTIM_ULPClockConfigTypeDef::SampleTime***
  Selects the clock sampling time to configure the clock glitch filter. Note: This parameter is used only when Ultra low power clock source is used. This parameter can be a value of ***LPTIM_Clock_Sample_Time***

44.1.3 LPTIM_TriggerConfigTypeDef

LPTIM_TriggerConfigTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t ActiveEdge***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_TriggerConfigTypeDef::Source***
  Selects the Trigger source. This parameter can be a value of ***LPTIM_Trigger_Source***
- ***uint32_t LPTIM_TriggerConfigTypeDef::ActiveEdge***
  Selects the Trigger active edge. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_External_Trigger_Polarity***
- ***uint32_t LPTIM_TriggerConfigTypeDef::SampleTime***
  Selects the trigger sampling time to configure the clock glitch filter. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_Trigger_Sample_Time***

44.1.4 LPTIM_InitTypeDef

LPTIM_InitTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***LPTIM_ClockConfigTypeDef Clock***
- ***LPTIM_ULPClockConfigTypeDef UltraLowPowerClock***

- ***LPTIM_TriggerConfigTypeDef Trigger***
- ***uint32_t Period***
- ***uint32_t UpdateMode***
- ***uint32_t CounterSource***
- ***uint32_t Input1Source***
- ***uint32_t Input2Source***
- ***uint32_t RepetitionCounter***

Field Documentation

- ***LPTIM_ClockConfigTypeDef LPTIM_InitTypeDef::Clock***
  Specifies the clock parameters
- ***LPTIM_ULPClockConfigTypeDef LPTIM_InitTypeDef::UltraLowPowerClock***
  Specifies the Ultra Low Power clock parameters
- ***LPTIM_TriggerConfigTypeDef LPTIM_InitTypeDef::Trigger***
  Specifies the Trigger parameters
- ***uint32_t LPTIM_InitTypeDef::Period***
  Specifies the period value to be loaded into the active Auto-Reload Register at the next update event. This parameter can be a number between Min_Data = 0x0001 and Max_Data = 0xFFFF.
- ***uint32_t LPTIM_InitTypeDef::UpdateMode***
  Specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period. This parameter can be a value of ***LPTIM_Updating_Mode***
- ***uint32_t LPTIM_InitTypeDef::CounterSource***
  Specifies whether the counter is incremented each internal event or each external event. This parameter can be a value of ***LPTIM_Counter_Source***
- ***uint32_t LPTIM_InitTypeDef::Input1Source***
  Specifies source selected for input1 (GPIO or comparator output). This parameter can be a value of ***LPTIM_Input1_Source***
- ***uint32_t LPTIM_InitTypeDef::Input2Source***
  Specifies source selected for input2 (GPIO or comparator output). Note: This parameter is used only for encoder feature so is used only for LPTIM1 instance. This parameter can be a value of ***LPTIM_Input2_Source***
- ***uint32_t LPTIM_InitTypeDef::RepetitionCounter***
  Specifies the repetition counter value. Each time the RCR downcounter reaches zero, an update event is generated and counting restarts from the RCR value (N). Note: When using repetition counter the UpdateMode field must be set to LPTIM_UPDATE_ENDOFPERIOD otherwise unpredictable behavior may occur. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.

44.1.5 LPTIM_OC_ConfigTypeDef

LPTIM_OC_ConfigTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***uint32_t Pulse***
- ***uint32_t OCPolarity***

Field Documentation

- ***uint32_t LPTIM_OC_ConfigTypeDef::Pulse***
  Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF
- ***uint32_t LPTIM_OC_ConfigTypeDef::OCPolarity***
  Specifies the output polarity. This parameter can be a value of ***LPTIM_Output_Compare_Polarity***

44.1.6 LPTIM_IC_ConfigTypeDef

LPTIM_IC_ConfigTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***uint32_t ICInputSource***
- ***uint32_t ICPrescaler***
- ***uint32_t ICPolarity***

- ***uint32_t ICFilter***

Field Documentation

- ***uint32_t LPTIM_IC_ConfigTypeDef::ICInputSource***
  Specifies source selected for IC channel. This parameter can be a value of ***LPTIM_Input_Capture_Source***
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICPrescaler***
  Specifies the Input Capture Prescaler. This parameter can be a value of ***LPTIM_Input_Capture_Prescaler***
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICPolarity***
  Specifies the active edge of the input signal. This parameter can be a value of ***LPTIM_Input_Capture_Polarity***
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICFilter***
  Specifies the input capture filter. This parameter can be a value of ***LPTIM_Input_Capture_Filter***

44.1.7 __LPTIM_HandleTypeDef

__LPTIM_HandleTypeDef is defined in the stm32h5xx_hal_lptim.h

Data Fields

- ***LPTIM_TypeDef * Instance***
- ***LPTIM_InitTypeDef Init***
- ***HAL_LPTIM_ActiveChannel Channel***
- ***DMA_HandleTypeDef * hdma***
- ***HAL_StatusTypeDef Status***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LPTIM_StateTypeDef State***
- ***__IO HAL_LPTIM_ChannelStateTypeDef ChannelState***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***void(* CompareMatchCallback***
- ***void(* AutoReloadMatchCallback***
- ***void(* TriggerCallback***
- ***void(* CompareWriteCallback***
- ***void(* AutoReloadWriteCallback***
- ***void(* DirectionUpCallback***
- ***void(* DirectionDownCallback***
- ***void(* UpdateEventCallback***
- ***void(* RepCounterWriteCallback***
- ***void(* UpdateEventHalfCpltCallback***
- ***void(* ErrorCallback***
- ***void(* IC_CaptureCallback***
- ***void(* IC_CaptureHalfCpltCallback***
- ***void(* IC_OverCaptureCallback***

Field Documentation

- ***LPTIM_TypeDef* __LPTIM_HandleTypeDef::Instance***
  Register base address
- ***LPTIM_InitTypeDef __LPTIM_HandleTypeDef::Init***
  LPTIM required parameters
- ***HAL_LPTIM_ActiveChannel __LPTIM_HandleTypeDef::Channel***
  Active channel
- ***DMA_HandleTypeDef* __LPTIM_HandleTypeDef::hdma[3]***
  DMA Handlers array, This array is accessed by a ***LPTIM_DMA_Handle_index***
- ***HAL_StatusTypeDef __LPTIM_HandleTypeDef::Status***
  LPTIM peripheral status

- ***HAL_LockTypeDef __LPTIM_HandleTypeDef::Lock***
  LPTIM locking object
- ***__IO HAL_LPTIM_StateTypeDef __LPTIM_HandleTypeDef::State***
  LPTIM peripheral state
- ***__IO HAL_LPTIM_ChannelStateTypeDef __LPTIM_HandleTypeDef::ChannelState[2]***
  LPTIM channel operation state
- ***void(* __LPTIM_HandleTypeDef::MspInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp Init Callback
- ***void(* __LPTIM_HandleTypeDef::MspDeInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp DeInit Callback
- ***void(* __LPTIM_HandleTypeDef::CompareMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare match Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload match Callback
- ***void(* __LPTIM_HandleTypeDef::TriggerCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  External trigger event detection Callback
- ***void(* __LPTIM_HandleTypeDef::CompareWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionUpCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Up-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionDownCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Down-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::UpdateEventCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Update event detection Callback
- ***void(* __LPTIM_HandleTypeDef::RepCounterWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Repetition counter register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::UpdateEventHalfCpltCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Update event half complete detection Callback
- ***void(* __LPTIM_HandleTypeDef::ErrorCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Error Callback
- ***void(* __LPTIM_HandleTypeDef::IC_CaptureCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Input capture Callback
- ***void(* __LPTIM_HandleTypeDef::IC_CaptureHalfCpltCallback)(struct __LPTIM_HandleTypeDef *htim)***
  Input Capture half complete Callback
- ***void(* __LPTIM_HandleTypeDef::IC_OverCaptureCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Over capture Callback

44.2 LPTIM Firmware driver API description

The following section lists the various functions of the LPTIM library.

44.2.1 How to use this driver

The LPTIM HAL driver can be used as follows:

1. Initialize the LPTIM low level resources by implementing the HAL_LPTIM_MspInit():
   - Enable the LPTIM interface clock using __HAL_RCC_LPTIMx_CLK_ENABLE().
   - In case of using interrupts (e.g. HAL_LPTIM_PWM_Start_IT()):
     - Configure the LPTIM interrupt priority using HAL_NVIC_SetPriority().
     - Enable the LPTIM IRQ handler using HAL_NVIC_EnableIRQ().
     - In LPTIM IRQ handler, call HAL_LPTIM_IRQHandler().
2. Initialize the LPTIM HAL using HAL_LPTIM_Init(). This function configures mainly:
   - The instance: LPTIM1, LPTIM2, LPTIM3, LPTIM4, LPTIM5 or LPTIM6.
   - Clock: the counter clock.
     - Source : it can be either the ULPTIM input (IN1) or one of the internal clock; (APB, LSE, LSI or CSI).
     - Prescaler: select the clock divider.
   - UltraLowPowerClock : To be used only if the ULPTIM is selected as counter clock source.
     - Polarity: polarity of the active edge for the counter unit if the ULPTIM input is selected.
     - SampleTime: clock sampling time to configure the clock glitch filter.
   - Trigger: How the counter start.
     - Source: trigger can be software or one of the hardware triggers.
     - ActiveEdge : only for hardware trigger.
     - SampleTime : trigger sampling time to configure the trigger glitch filter.
   - OutputPolarity : 2 opposite polarities are possible.
   - UpdateMode: specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period.
   - Input1Source: Source selected for input1 (GPIO or comparator output).
   - Input2Source: Source selected for input2 (GPIO or comparator output). Input2 is used only for encoder feature so is used only for LPTIM1 instance.
3. Six modes are available:
   - PWM Mode: To generate a PWM signal with specified period and pulse, call HAL_LPTIM_PWM_Start() or HAL_LPTIM_PWM_Start_IT() for interruption mode.
   - One Pulse Mode: To generate pulse with specified width in response to a stimulus, call HAL_LPTIM_OnePulse_Start() or HAL_LPTIM_OnePulse_Start_IT() for interruption mode.
   - Set once Mode: In this mode, the output changes the level (from low level to high level if the output polarity is configured high, else the opposite) when a compare match occurs. To start this mode, call HAL_LPTIM_SetOnce_Start() or HAL_LPTIM_SetOnce_Start_IT() for interruption mode.
   - Encoder Mode: To use the encoder interface call HAL_LPTIM_Encoder_Start() or HAL_LPTIM_Encoder_Start_IT() for interruption mode. Only available for LPTIM1 instance.
   - Time out Mode: an active edge on one selected trigger input rests the counter. The first trigger event will start the timer, any successive trigger event will reset the counter and the timer will restart. To start this mode call HAL_LPTIM_TimeOut_Start_IT() or HAL_LPTIM_TimeOut_Start_IT() for interruption mode.
   - Counter Mode: counter can be used to count external events on the LPTIM Input1 or it can be used to count internal clock cycles. To start this mode, call HAL_LPTIM_Counter_Start() or HAL_LPTIM_Counter_Start_IT() for interruption mode.
4. User can stop any process by calling the corresponding API: HAL_LPTIM_Xxx_Stop() or HAL_LPTIM_Xxx_Stop_IT() if the process is already started in interruption mode.
5. De-initialize the LPTIM peripheral using HAL_LPTIM_DeInit().

Callback registration

The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_LPTIM_RegisterCallback() to register a callback. HAL_LPTIM_RegisterCallback() takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_LPTIM_UnRegisterCallback() to reset a callback to the default weak function. HAL_LPTIM_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID.

These functions allow to register/unregister following callbacks:

- MspInitCallback : LPTIM Base Msp Init Callback.
- MspDeInitCallback : LPTIM Base Msp DeInit Callback.
- CompareMatchCallback : Compare match Callback.
- AutoReloadMatchCallback : Auto-reload match Callback.
- TriggerCallback : External trigger event detection Callback.
- CompareWriteCallback : Compare register write complete Callback.
- AutoReloadWriteCallback : Auto-reload register write complete Callback.
- DirectionUpCallback : Up-counting direction change Callback.
- DirectionDownCallback : Down-counting direction change Callback.
- UpdateEventCallback : Update event detection Callback.
- RepCounterWriteCallback : Repetition counter register write complete Callback.

By default, after the Init and when the state is HAL_LPTIM_STATE_RESET all interrupt callbacks are set to the corresponding weak functions: examples HAL_LPTIM_TriggerCallback(), HAL_LPTIM_CompareMatchCallback().

Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functionalities in the Init/DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the Init/DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in HAL_LPTIM_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_LPTIM_STATE_READY or HAL_LPTIM_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LPTIM_RegisterCallback() before calling DeInit or Init function.

When The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

44.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the LPTIM according to the specified parameters in the LPTIM_InitTypeDef and initialize the associated handle.
- DeInitialize the LPTIM peripheral.
- Initialize the LPTIM MSP.
- DeInitialize the LPTIM MSP.

This section contains the following APIs:

- ***HAL_LPTIM_Init()***
- ***HAL_LPTIM_DeInit()***
- ***HAL_LPTIM_MspInit()***
- ***HAL_LPTIM_MspDeInit()***

44.2.3 LPTIM Start Stop operation functions

This section provides functions allowing to:

- Start the PWM mode.
- Stop the PWM mode.
- Start the One pulse mode.
- Stop the One pulse mode.
- Start the Set once mode.
- Stop the Set once mode.
- Start the Encoder mode.
- Stop the Encoder mode.
- Start the Timeout mode.
- Stop the Timeout mode.
- Start the Counter mode.
- Stop the Counter mode.

This section contains the following APIs:

- *HAL_LPTIM_PWM_Start()*
- *HAL_LPTIM_PWM_Stop()*
- *HAL_LPTIM_PWM_Start_IT()*
- *HAL_LPTIM_PWM_Stop_IT()*
- *HAL_LPTIM_PWM_Start_DMA()*
- *HAL_LPTIM_PWM_Stop_DMA()*
- *HAL_LPTIM_OnePulse_Start()*
- *HAL_LPTIM_OnePulse_Stop()*
- *HAL_LPTIM_OnePulse_Start_IT()*
- *HAL_LPTIM_OnePulse_Stop_IT()*
- *HAL_LPTIM_SetOnce_Start()*
- *HAL_LPTIM_SetOnce_Stop()*
- *HAL_LPTIM_SetOnce_Start_IT()*
- *HAL_LPTIM_SetOnce_Stop_IT()*
- *HAL_LPTIM_Encoder_Start()*
- *HAL_LPTIM_Encoder_Stop()*
- *HAL_LPTIM_Encoder_Start_IT()*
- *HAL_LPTIM_Encoder_Stop_IT()*
- *HAL_LPTIM_TimeOut_Start()*
- *HAL_LPTIM_TimeOut_Stop()*
- *HAL_LPTIM_TimeOut_Start_IT()*
- *HAL_LPTIM_TimeOut_Stop_IT()*
- *HAL_LPTIM_Counter_Start()*
- *HAL_LPTIM_Counter_Stop()*
- *HAL_LPTIM_Counter_Start_IT()*
- *HAL_LPTIM_Counter_Stop_IT()*
- *HAL_LPTIM_IC_Start()*
- *HAL_LPTIM_IC_Stop()*
- *HAL_LPTIM_IC_Start_IT()*
- *HAL_LPTIM_IC_Stop_IT()*
- *HAL_LPTIM_IC_Start_DMA()*
- *HAL_LPTIM_IC_Stop_DMA()*
- *HAL_LPTIM_OC_ConfigChannel()*
- *HAL_LPTIM_IC_ConfigChannel()*

44.2.4 LPTIM Read operation functions

This section provides LPTIM Reading functions.

- Read the counter value.
- Read the period (Auto-reload) value.
- Read the pulse (Compare)value.

This section contains the following APIs:

- *HAL_LPTIM_ReadCounter()*
- *HAL_LPTIM_ReadAutoReload()*
- *HAL_LPTIM_ReadCapturedValue()*
- *HAL_LPTIM_IC_GetOffset()*

44.2.5 LPTIM Config function

This section provides LPTIM Config function.

- Configure channel: Output Compare mode, Period, Polarity.

This section contains the following APIs:

- *HAL_LPTIM_OC_ConfigChannel()*
- *HAL_LPTIM_IC_ConfigChannel()*

44.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_LPTIM_GetState()*

44.2.7 Detailed description of functions

HAL_LPTIM_Init

Function name

HAL_StatusTypeDef HAL_LPTIM_Init (LPTIM_HandleTypeDef * hlptim)

Function description

Initialize the LPTIM according to the specified parameters in the LPTIM_InitTypeDef and initialize the associated handle.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_DeInit

Function name

HAL_StatusTypeDef HAL_LPTIM_DeInit (LPTIM_HandleTypeDef * hlptim)

Function description

DeInitialize the LPTIM peripheral.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_MspInit

Function name

void HAL_LPTIM_MspInit (LPTIM_HandleTypeDef * hlptim)

Function description

Initialize the LPTIM MSP.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_MspDeInit

Function name

void HAL_LPTIM_MspDeInit (LPTIM_HandleTypeDef * hlptim)

Function description

DeInitialize LPTIM MSP.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_OC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_LPTIM_OC_ConfigChannel (LPTIM_HandleTypeDef * hlptim, const LPTIM_OC_ConfigTypeDef * sConfig, uint32_t Channel)

Function description

Parameters

- **hlptim:** LPTIM handle
- **sConfig:** The output configuration structure
- **Channel:** LPTIM Channel to be configured This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

Notes

- Successive calls to HAL_LPTIM_OC_ConfigChannel can only be performed after a delay that must be greater or equal than the value of (PRESC x 3) kernel clock cycles, PRESC[2:0] being the clock decimal division factor (1, 2, 4, ..., 128). Any successive call violating this delay, leads to unpredictable results.

HAL_LPTIM_PWM_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM PWM generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM PWM generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM PWM generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM PWM generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Start_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel, const uint32_t * pData, uint32_t Length)

Function description

Start the LPTIM PWM generation in DMA mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected
- **pData:** The destination Buffer address
- **Length:** The length of data to be transferred from LPTIM peripheral to memory

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM PWM generation in DMA mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM One pulse generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM One pulse generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM One pulse generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM One pulse generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM in Set once mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM Set once mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM Set once mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM Set once mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Encoder interface.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Encoder interface.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Encoder interface in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Encoder interface in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_TimeOut_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Timeout)

Function description

Start the Timeout function.

Parameters

- **hlptim:** LPTIM handle
- **Timeout:** Specifies the TimeOut value to reset the counter. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

Notes

- The first trigger event will start the timer, any successive trigger event will reset the counter and the timer restarts.

HAL_LPTIM_TimeOut_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Timeout function.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_TimeOut_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Timeout)

Function description

Start the Timeout function in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Timeout:** Specifies the TimeOut value to reset the counter. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

Notes

- The first trigger event will start the timer, any successive trigger event will reset the counter and the timer restarts.

HAL_LPTIM_TimeOut_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Timeout function in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Counter mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Counter mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Counter mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Counter mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_IC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_ConfigChannel (LPTIM_HandleTypeDef * hlptim, const LPTIM_IC_ConfigTypeDef * sConfig, uint32_t Channel)

Function description

Parameters

- **hlptim:** LPTIM handle
- **sConfig:** The input configuration structure
- **Channel:** LPTIM Channel to be configured This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

Notes

- Successive calls to HAL_LPTIM_IC_ConfigChannel can only be performed after a delay that must be greater or equal than the value of (PRESC x 3) kernel clock cycles, PRESC[2:0] being the clock decimal division factor (1, 2, 4, ..., 128). Any successive call violating this delay, leads to unpredictable results.

HAL_LPTIM_IC_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Starts the LPTIM Input Capture measurement.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stops the LPTIM Input Capture measurement.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Starts the LPTIM Input Capture measurement in interrupt mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stops the LPTIM Input Capture measurement in interrupt mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Start_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel, uint32_t * pData, uint32_t Length)

Function description

Starts the LPTIM Input Capture measurement in DMA mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected
- **pData:** The destination Buffer address
- **Length:** The length of data to be transferred from LPTIM peripheral to memory

Return values

- **HAL:** status

HAL_LPTIM_IC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stops the LPTIM Input Capture measurement in DMA mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_ReadCounter

Function name

uint32_t HAL_LPTIM_ReadCounter (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current counter value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Counter:** value.

HAL_LPTIM_ReadAutoReload

Function name

uint32_t HAL_LPTIM_ReadAutoReload (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current Autoreload (Period) value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Autoreload:** value.

HAL_LPTIM_ReadCapturedValue

Function name

uint32_t HAL_LPTIM_ReadCapturedValue (const LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Return the current Compare (Pulse) value.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be selected This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **Compare:** value.

HAL_LPTIM_IC_GetOffset

Function name

uint8_t HAL_LPTIM_IC_GetOffset (const LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

LPTimer Input Capture Get Offset(in counter step unit)

Parameters

- **hlptim:** pointer to a LPTIM_HandleTypeDef structure that contains the configuration information for LPTIM module.
- **Channel:** This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **The:** offset value

Notes

- The real capture value corresponding to the input capture trigger can be calculated using the formula hereafter : Real capture value = captured(LPTIM_CCRx) - offset The Offset value is depending on the glitch filter value for the channel and the value of the prescaler for the kernel clock. Please check Errata Sheet V1_8 for more details under "variable latency on input capture channel" section.

HAL_LPTIM_IRQHandler

Function name

void HAL_LPTIM_IRQHandler (LPTIM_HandleTypeDef * hlptim)

Function description

Handle LPTIM interrupt request.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_CompareMatchCallback

Function name

void HAL_LPTIM_CompareMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Compare match callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_AutoReloadMatchCallback

Function name

void HAL_LPTIM_AutoReloadMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Autoreload match callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_TriggerCallback

Function name

void HAL_LPTIM_TriggerCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Trigger detected callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_CompareWriteCallback

Function name

void HAL_LPTIM_CompareWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Compare write callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_AutoReloadWriteCallback

Function name

void HAL_LPTIM_AutoReloadWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Autoreload write callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_DirectionUpCallback

Function name

void HAL_LPTIM_DirectionUpCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Direction counter changed from Down to Up callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_DirectionDownCallback

Function name

void HAL_LPTIM_DirectionDownCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Direction counter changed from Up to Down callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_ErrorCallback

Function name

void HAL_LPTIM_ErrorCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Error callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_UpdateEventCallback

Function name

void HAL_LPTIM_UpdateEventCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Repetition counter underflowed (or contains zero) and LPTIM counter overflowed callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_UpdateEventHalfCpltCallback

Function name

void HAL_LPTIM_UpdateEventHalfCpltCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Update event half complete callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_RepCounterWriteCallback

Function name

void HAL_LPTIM_RepCounterWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Successful APB bus write to repetition counter register callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_IC_CaptureCallback

Function name

void HAL_LPTIM_IC_CaptureCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Input Capture callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_IC_CaptureHalfCpltCallback

Function name

void HAL_LPTIM_IC_CaptureHalfCpltCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Input Capture half complete callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM IC handle

Return values

- **None:**

HAL_LPTIM_IC_OverCaptureCallback

Function name

void HAL_LPTIM_IC_OverCaptureCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Over Capture callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_RegisterCallback (LPTIM_HandleTypeDef * hlptim, HAL_LPTIM_CallbackIDTypeDef CallbackID, pLPTIM_CallbackTypeDef pCallback)

Function description

Register a User LPTIM callback to be used instead of the weak predefined callback.

Parameters

- **hlptim:** LPTIM handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_LPTIM_MSPINIT_CB_ID LPTIM Base Msp Init Callback ID
  - HAL_LPTIM_MSPDEINIT_CB_ID LPTIM Base Msp DeInit Callback ID
  - HAL_LPTIM_COMPARE_MATCH_CB_ID Compare match Callback ID
  - HAL_LPTIM_AUTORELOAD_MATCH_CB_ID Auto-reload match Callback ID
  - HAL_LPTIM_TRIGGER_CB_ID External trigger event detection Callback ID
  - HAL_LPTIM_COMPARE_WRITE_CB_ID Compare register write complete Callback ID
  - HAL_LPTIM_AUTORELOAD_WRITE_CB_ID Auto-reload register write complete Callback ID
  - HAL_LPTIM_DIRECTION_UP_CB_ID Up-counting direction change Callback ID
  - HAL_LPTIM_DIRECTION_DOWN_CB_ID Down-counting direction change Callback ID
  - HAL_LPTIM_UPDATE_EVENT_CB_ID Update event detection Callback ID
  - HAL_LPTIM_REP_COUNTER_WRITE_CB_ID Repetition counter register write complete Callback ID
  - HAL_LPTIM_UPDATE_EVENT_HALF_CB_ID Update event Half detection Callback ID
  - HAL_LPTIM_ERROR_CB_ID Error Callback ID
  - HAL_LPTIM_IC_CAPTURE_CB_ID Input Capture Callback ID
  - HAL_LPTIM_IC_CAPTURE_HALF_CB_ID Input Capture half complete Callback ID
  - HAL_LPTIM_OVER_CAPTURE_CB_ID Over Capture Callback ID
- **pCallback:** pointer to the callback function

Return values

- **status:**

HAL_LPTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_UnRegisterCallback (LPTIM_HandleTypeDef * hlptim, HAL_LPTIM_CallbackIDTypeDef CallbackID)

Function description

Unregister a LPTIM callback LLPTIM callback is redirected to the weak predefined callback.

Parameters

- **hlptim:** LPTIM handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_LPTIM_MSPINIT_CB_ID LPTIM Base Msp Init Callback ID
  - HAL_LPTIM_MSPDEINIT_CB_ID LPTIM Base Msp DeInit Callback ID
  - HAL_LPTIM_COMPARE_MATCH_CB_ID Compare match Callback ID
  - HAL_LPTIM_AUTORELOAD_MATCH_CB_ID Auto-reload match Callback ID
  - HAL_LPTIM_TRIGGER_CB_ID External trigger event detection Callback ID
  - HAL_LPTIM_COMPARE_WRITE_CB_ID Compare register write complete Callback ID
  - HAL_LPTIM_AUTORELOAD_WRITE_CB_ID Auto-reload register write complete Callback ID
  - HAL_LPTIM_DIRECTION_UP_CB_ID Up-counting direction change Callback ID
  - HAL_LPTIM_DIRECTION_DOWN_CB_ID Down-counting direction change Callback ID
  - HAL_LPTIM_UPDATE_EVENT_CB_ID Update event detection Callback ID
  - HAL_LPTIM_REP_COUNTER_WRITE_CB_ID Repetition counter register write complete Callback ID
  - HAL_LPTIM_UPDATE_EVENT_HALF_CB_ID Update event Half detection Callback ID
  - HAL_LPTIM_ERROR_CB_ID Error Callback ID
  - HAL_LPTIM_IC_CAPTURE_CB_ID Input Capture Callback ID
  - HAL_LPTIM_IC_CAPTURE_HALF_CB_ID Input Capture half complete Callback ID
  - HAL_LPTIM_OVER_CAPTURE_CB_ID Over Capture Callback ID

Return values

- **status:**

HAL_LPTIM_GetState

Function name

HAL_LPTIM_StateTypeDef HAL_LPTIM_GetState (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the LPTIM handle state.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** state

44.3 LPTIM Firmware driver defines

The following section lists the various define and macros of the module.

44.3.1 LPTIM

LPTIM

LPTIM Channel

LPTIM_CHANNEL_1

Capture/compare channel 1 identifier

LPTIM_CHANNEL_2

Capture/compare channel 2 identifier

LPTIM Clock Polarity

LPTIM_CLOCKPOLARITY_RISING

LPTIM_CLOCKPOLARITY_FALLING

LPTIM_CLOCKPOLARITY_RISING_FALLING

LPTIM Clock Prescaler

LPTIM_PRESCALER_DIV1

LPTIM_PRESCALER_DIV2

LPTIM_PRESCALER_DIV4

LPTIM_PRESCALER_DIV8

LPTIM_PRESCALER_DIV16

LPTIM_PRESCALER_DIV32

LPTIM_PRESCALER_DIV64

LPTIM_PRESCALER_DIV128

LPTIM Clock Sample Time

LPTIM_CLOCKSAMPLETIME_DIRECTTRANSITION

LPTIM_CLOCKSAMPLETIME_2TRANSITIONS

LPTIM_CLOCKSAMPLETIME_4TRANSITIONS

LPTIM_CLOCKSAMPLETIME_8TRANSITIONS

LPTIM Clock Source

LPTIM_CLOCKSOURCE_APBCLOCK_LPOSC

LPTIM_CLOCKSOURCE_ULPTIM

LPTIM Counter Source

LPTIM_COUNTERSOURCE_INTERNAL

LPTIM_COUNTERSOURCE_EXTERNAL

LPTIM DMA Handle Index

LPTIM_DMA_ID_UPDATE

Index of the DMA handle used for Update DMA requests

LPTIM_DMA_ID_CC1

Index of the DMA handle used for Capture/Update event 1 DMA request

LPTIM_DMA_ID_CC2

Index of the DMA handle used for Capture/Update event 2 DMA request

LPTIM DMA Sources

LPTIM_DMA_UPDATE

DMA request is triggered by the update event

LPTIM_DMA_CC1

DMA request is triggered by the capture 1 event

LPTIM_DMA_CC2

DMA request is triggered by the capture 2 event

LPTIM Exported Macros

__HAL_LPTIM_RESET_HANDLE_STATE

Description:

- Reset LPTIM handle state.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_ENABLE

Description:

- Enable the LPTIM peripheral.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_DISABLE

Description:

- Disable the LPTIM peripheral.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_START_CONTINUOUS

Description:

- Start the LPTIM peripheral in Continuous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_START_SINGLE

Description:

- Start the LPTIM peripheral in single mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_RESET_COUNTER

Description:

- Reset the LPTIM Counter register in synchronous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_RESET_COUNTER_AFTERREAD

Description:

- Reset after read of the LPTIM Counter register in asynchronous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_AUTORELOAD_SET

Description:

- Write the passed parameter in the Autoreload register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Autoreload value

Return value:

- None

Notes:

- The ARR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_COMPARE_SET

Description:

- Write the passed parameter in the Compare register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Compare value
- __CHANNEL__: TIM Channel to be configured

Return value:

- None

Notes:

- The CCRx registers can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_REPETITIONCOUNTER_SET

Description:

- Write the passed parameter in the Repetition register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Repetition value

Return value:

- None

__HAL_LPTIM_REPETITIONCOUNTER_GET

Description:

- Return the current Repetition value.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- Repetition: register value

Notes:

- The RCR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_CAPTURE_COMPARE_ENABLE

Description:

- Enable the LPTIM signal input/output on the corresponding pin.

Parameters:

- __HANDLE__: LPTIM handle
- __CHANNEL__: LPTIM Channels to be enabled. This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return value:

- None

__HAL_LPTIM_CAPTURE_COMPARE_DISABLE

Description:

- Disable the LPTIM signal input/output on the corresponding pin.

Parameters:

- __HANDLE__: LPTIM handle
- __CHANNEL__: LPTIM Channels to be disabled. This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return value:

- None

__HAL_LPTIM_GET_FLAG

Description:

- Check whether the specified LPTIM flag is set or not.

Parameters:

- __HANDLE__: LPTIM handle
- __FLAG__: LPTIM flag to check This parameter can be a value of:
  - LPTIM_FLAG_REPOK : Repetition register update OK Flag.
  - LPTIM_FLAG_UPDATE : Update event Flag.
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMP1OK : Compare register 1 update OK Flag.
  - LPTIM_FLAG_CMP2OK : Compare register 2 update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CC1 : Capture/Compare 1 interrupt flag.
  - LPTIM_FLAG_CC2 : Capture/Compare 2 interrupt flag.
  - LPTIM_FLAG_CC1O : Capture/Compare 1 over-capture flag.
  - LPTIM_FLAG_CC2O : Capture/Compare 2 over-capture flag.
  - LPTIM_FLAG_DIEROK : DMA & interrupt enable update OK flag.

Return value:

- The: state of the specified flag (SET or RESET).

__HAL_LPTIM_CLEAR_FLAG

Description:

- Clear the specified LPTIM flag.

Parameters:

- __HANDLE__: LPTIM handle.
- __FLAG__: LPTIM flag to clear. This parameter can be a value of:
  - LPTIM_FLAG_REPOK : Repetition register update OK Flag.
  - LPTIM_FLAG_UPDATE : Update event Flag.
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMP1OK : Compare register 1 update OK Flag.
  - LPTIM_FLAG_CMP2OK : Compare register 2 update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CC1 : Capture/Compare 1 interrupt flag.
  - LPTIM_FLAG_CC2 : Capture/Compare 2 interrupt flag.
  - LPTIM_FLAG_CC1O : Capture/Compare 1 over-capture flag.
  - LPTIM_FLAG_CC2O : Capture/Compare 2 over-capture flag.
  - LPTIM_FLAG_DIEROK : DMA & interrupt enable update OK flag.

Return value:

- None.

__HAL_LPTIM_ENABLE_IT

Description:

- Enable the specified LPTIM interrupt.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- None.

Notes:

- The LPTIM interrupts can only be enabled when the LPTIM instance is enabled.

__HAL_LPTIM_DISABLE_IT

Description:

- Disable the specified LPTIM interrupt.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- None.

Notes:

- The LPTIM interrupts can only be disabled when the LPTIM instance is enabled.

__HAL_LPTIM_ENABLE_DMA

Description:

- Enable the specified DMA request.

Parameters:

- __HANDLE__: specifies the TIM Handle.
- __DMA__: specifies the LPTIM DMA request to enable. This parameter can be one of the following values:
  - LPTIM_DMA_UPDATE: Update DMA request
  - LPTIM_DMA_CC1: Capture/Compare 1 DMA request
  - LPTIM_DMA_CC2: Capture/Compare 2 DMA request

Return value:

- None

__HAL_LPTIM_DISABLE_DMA

Description:

- Disable the specified DMA request.

Parameters:

- __HANDLE__: specifies the LPTIM Handle.
- __DMA__: specifies the LPTIM DMA request to disable. This parameter can be one of the following values:
  - LPTIM_DMA_UPDATE: Update DMA request
  - LPTIM_DMA_CC1: Capture/Compare 1 DMA request
  - LPTIM_DMA_CC2: Capture/Compare 2 DMA request

Return value:

- None

__HAL_LPTIM_GET_IT_SOURCE

Description:

- Check whether the specified LPTIM interrupt source is enabled or not.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to check. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- Interrupt: status.

- ***__IO uint8_t HAL_MMC_CardCIDTypeDef::Reserved2***
  Always 1

45.2 MMC Firmware driver API description

The following section lists the various functions of the MMC library.

45.2.1 How to use this driver

This driver implements a high level communication layer for read and write from/to this memory. The needed STM32 hardware resources (SDMMC and GPIO) are performed by the user in HAL_MMC_MspInit() function (MSP layer). Basically, the MSP layer configuration should be the same as we provide in the examples. You can easily tailor this configuration according to hardware resources.

This driver is a generic layered driver for SDMMC memories which uses the HAL SDMMC driver functions to interface with MMC and eMMC cards devices. It is used as follows:

1. Initialize the SDMMC low level resources by implement the HAL_MMC_MspInit() API:
   a. Enable the SDMMC interface clock using __HAL_RCC_SDMMC_CLK_ENABLE();
   b. SDMMC pins configuration for MMC card
      - Enable the clock for the SDMMC GPIOs using the functions __HAL_RCC_GPIOx_CLK_ENABLE();
      - Configure these SDMMC pins as alternate function pull-up using HAL_GPIO_Init() and according to your pin assignment;
   c. NVIC configuration if you need to use interrupt process (HAL_MMC_ReadBlocks_IT() and HAL_MMC_WriteBlocks_IT() APIs).
      - Configure the SDMMC interrupt priorities using function HAL_NVIC_SetPriority();
      - Enable the NVIC SDMMC IRQs using function HAL_NVIC_EnableIRQ()
      - SDMMC interrupts are managed using the macros __HAL_MMC_ENABLE_IT() and __HAL_MMC_DISABLE_IT() inside the communication process.
      - SDMMC interrupts pending bits are managed using the macros __HAL_MMC_GET_IT() and __HAL_MMC_CLEAR_IT()
   d. No general propose DMA Configuration is needed, an Internal DMA for SDMMC Peripheral are used.
2. At this stage, you can perform MMC read/write/erase operations after MMC card initialization

MMC Card Initialization and configuration

To initialize the MMC Card, use the HAL_MMC_Init() function. It Initializes SDMMC Peripheral (STM32 side) and the MMC Card, and put it into StandBy State (Ready for data transfer). This function provide the following operations:

1. Initialize the SDMMC peripheral interface with default configuration. The initialization process is done at 400KHz. You can change or adapt this frequency by adjusting the "ClockDiv" field. The MMC Card frequency (SDMMC_CK) is computed as follows: SDMMC_CK = SDMMCCLK / (2 * ClockDiv) In initialization mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 400KHz. This phase of initialization is done through SDMMC_Init() and SDMMC_PowerState_ON() SDMMC low level APIs.
2. Initialize the MMC card. The API used is HAL_MMC_InitCard(). This phase allows the card initialization and identification and check the MMC Card type (Standard Capacity or High Capacity) The initialization flow is compatible with MMC standard. This API (HAL_MMC_InitCard()) could be used also to reinitialize the card in case of plug-off plug-in.
3. Configure the MMC Card Data transfer frequency. By Default, the card transfer frequency by adjusting the "ClockDiv" field. In transfer mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 25MHz and 100MHz in High-speed mode switch.
4. Select the corresponding MMC Card according to the address read with the step 2.
5. Configure the MMC Card in wide bus mode: 4-bits data.

MMC Card Read operation

- You can read from MMC card in polling mode by using function HAL_MMC_ReadBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can read from MMC card in DMA mode by using function HAL_MMC_ReadBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Rx interrupt event.
- You can read from MMC card in Interrupt mode by using function HAL_MMC_ReadBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Rx interrupt event.

MMC Card Write operation

- You can write to MMC card in polling mode by using function HAL_MMC_WriteBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can write to MMC card in DMA mode by using function HAL_MMC_WriteBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 byte). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Tx interrupt event.
- You can write to MMC card in Interrupt mode by using function HAL_MMC_WriteBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Tx interrupt event.

MMC card information

- To get MMC card information, you can use the function HAL_MMC_GetCardInfo(). It returns useful information about the MMC card such as block size, card type, block number ...

MMC card CSD register

- The HAL_MMC_GetCardCSD() API allows to get the parameters of the CSD register. Some of the CSD parameters are useful for card initialization and identification.

MMC card CID register

- The HAL_MMC_GetCardCID() API allows to get the parameters of the CID register. Some of the CID parameters are useful for card initialization and identification.

MMC HAL driver macros list

Below the list of most used macros in MMC HAL driver.

- __HAL_MMC_ENABLE_IT: Enable the MMC device interrupt
- __HAL_MMC_DISABLE_IT: Disable the MMC device interrupt
- __HAL_MMC_GET_FLAG:Check whether the specified MMC flag is set or not
- __HAL_MMC_CLEAR_FLAG: Clear the MMC's pending flags

Note: You can refer to the MMC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_MMC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_MMC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMALnkLstBufCpltCallback : callback when the DMA reception of linked list node buffer is completed.
- Write_DMALnkLstBufCpltCallback : callback when the DMA transmission of linked list node buffer is completed.
- MspInitCallback : MMC MspInit.

- MspDeInitCallback : MMC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_MMC_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMADblBuf0CpltCallback : callback when the DMA reception of first buffer is completed.
- Read_DMADblBuf1CpltCallback : callback when the DMA reception of second buffer is completed.
- Write_DMADblBuf0CpltCallback : callback when the DMA transmission of first buffer is completed.
- Write_DMADblBuf1CpltCallback : callback when the DMA transmission of second buffer is completed.
- MspInitCallback : MMC MspInit.
- MspDeInitCallback : MMC MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_MMC_Init and if the state is HAL_MMC_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_MMC_Init and HAL_MMC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_MMC_Init and HAL_MMC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_MMC_RegisterCallback before calling HAL_MMC_DeInit or HAL_MMC_Init function. When The compilation define USE_HAL_MMC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

45.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the MMC card device to be ready for use.

This section contains the following APIs:

- ***HAL_MMC_Init()***
- ***HAL_MMC_InitCard()***
- ***HAL_MMC_DeInit()***
- ***HAL_MMC_MspInit()***
- ***HAL_MMC_MspDeInit()***

45.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the data transfer from/to MMC card.

This section contains the following APIs:

- ***HAL_MMC_ReadBlocks()***
- ***HAL_MMC_WriteBlocks()***
- ***HAL_MMC_ReadBlocks_IT()***
- ***HAL_MMC_WriteBlocks_IT()***
- ***HAL_MMC_ReadBlocks_DMA()***
- ***HAL_MMC_WriteBlocks_DMA()***
- ***HAL_MMC_Erase()***
- ***HAL_MMC_IRQHandler()***
- ***HAL_MMC_GetState()***
- ***HAL_MMC_GetError()***
- ***HAL_MMC_TxCpltCallback()***
- ***HAL_MMC_RxCpltCallback()***
- ***HAL_MMC_ErrorCallback()***
- ***HAL_MMC_AbortCallback()***

- *HAL_MMC_RegisterCallback()*
- *HAL_MMC_UnRegisterCallback()*

45.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the MMC card operations and get the related information

This section contains the following APIs:

- *HAL_MMC_GetCardCID()*
- *HAL_MMC_GetCardCSD()*
- *HAL_MMC_GetCardInfo()*
- *HAL_MMC_GetCardExtCSD()*
- *HAL_MMC_ConfigWideBusOperation()*
- *HAL_MMC_ConfigSpeedBusOperation()*
- *HAL_MMC_GetCardState()*
- *HAL_MMC_Abort()*
- *HAL_MMC_Abort_IT()*
- *HAL_MMC_EraseSequence()*
- *HAL_MMC_Sanitize()*
- *HAL_MMC_ConfigSecRemovalType()*
- *HAL_MMC_GetSupportedSecRemovalType()*
- *HAL_MMC_SleepDevice()*
- *HAL_MMC_AwakeDevice()*

45.2.5 Detailed description of functions

HAL_MMC_Init

Function name

HAL_StatusTypeDef HAL_MMC_Init (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC according to the specified parameters in the MMC_HandleTypeDef and create the associated handle.

Parameters

- **hmmc:** Pointer to the MMC handle

Return values

- **HAL:** status

HAL_MMC_InitCard

Function name

HAL_StatusTypeDef HAL_MMC_InitCard (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC Card.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

Notes

- This function initializes the MMC card. It could be used when a card re-initialization is needed.

HAL_MMC_DeInit

Function name

HAL_StatusTypeDef HAL_MMC_DeInit (MMC_HandleTypeDef * hmmc)

Function description

De-Initializes the MMC card.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_MspInit

Function name

void HAL_MMC_MspInit (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC MSP.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_MspDeInit

Function name

void HAL_MMC_MspDeInit (MMC_HandleTypeDef * hmmc)

Function description

De-Initialize MMC MSP.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of MMC blocks to read
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

Allows to write block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of MMC blocks to write
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_Erase

Function name

HAL_StatusTypeDef HAL_MMC_Erase (MMC_HandleTypeDef * hmmc, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

Erases the specified memory area of the given MMC card.

Parameters

- **hmmc:** Pointer to MMC handle
- **BlockStartAdd:** Start Block address
- **BlockEndAdd:** End Block address

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_ReadBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_IT (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of blocks to read.

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the IT transfer process through the MMC Rx interrupt event.

HAL_MMC_WriteBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Writes block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the IT transfer process through the MMC Tx interrupt event.

HAL_MMC_ReadBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_DMA (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer MMC handle
- **pData:** Pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of blocks to read.

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the DMA transfer process through the MMC Rx interrupt event.

HAL_MMC_WriteBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_DMA (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Writes block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the DMA transfer process through the MMC Tx interrupt event.

HAL_MMC_IRQHandler

Function name

void HAL_MMC_IRQHandler (MMC_HandleTypeDef * hmmc)

Function description

This function handles MMC card interrupt request.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_TxCpltCallback

Function name

void HAL_MMC_TxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Tx Transfer completed callbacks.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_RxCpltCallback

Function name

void HAL_MMC_RxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Rx Transfer completed callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_ErrorCallback

Function name

void HAL_MMC_ErrorCallback (MMC_HandleTypeDef * hmmc)

Function description

MMC error callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_AbortCallback

Function name

void HAL_MMC_AbortCallback (MMC_HandleTypeDef * hmmc)

Function description

MMC Abort callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_RegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId, pMMC_CallbackTypeDef pCallback)

Function description

Register a User MMC Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hmmc:** : MMC handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_MMC_TX_CPLT_CB_ID MMC Tx Complete Callback ID
  - HAL_MMC_RX_CPLT_CB_ID MMC Rx Complete Callback ID
  - HAL_MMC_ERROR_CB_ID MMC Error Callback ID
  - HAL_MMC_ABORT_CB_ID MMC Abort Callback ID
  - HAL_MMC_READ_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Rx Linked List Node buffer Callback ID
  - HAL_MMC_WRITE_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Tx Linked List Node buffer Callback ID
  - HAL_MMC_MSP_INIT_CB_ID MMC MspInit Callback ID
  - HAL_MMC_MSP_DEINIT_CB_ID MMC MspDeInit Callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

Notes

- The HAL_MMC_RegisterCallback() may be called before HAL_MMC_Init() in HAL_MMC_STATE_RESET to register callbacks for HAL_MMC_MSP_INIT_CB_ID and HAL_MMC_MSP_DEINIT_CB_ID.

HAL_MMC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_UnRegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId)

Function description

Unregister a User MMC Callback MMC Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hmmc:** : MMC handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_MMC_TX_CPLT_CB_ID MMC Tx Complete Callback ID
  - HAL_MMC_RX_CPLT_CB_ID MMC Rx Complete Callback ID
  - HAL_MMC_ERROR_CB_ID MMC Error Callback ID
  - HAL_MMC_ABORT_CB_ID MMC Abort Callback ID
  - HAL_MMC_READ_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Rx Linked List Node buffer Callback ID
  - HAL_MMC_WRITE_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Tx Linked List Node buffer Callback ID
  - HAL_MMC_MSP_INIT_CB_ID MMC MspInit Callback ID
  - HAL_MMC_MSP_DEINIT_CB_ID MMC MspDeInit Callback ID

Return values

- **status:**

Notes

- The HAL_MMC_UnRegisterCallback() may be called before HAL_MMC_Init() in HAL_MMC_STATE_RESET to register callbacks for HAL_MMC_MSP_INIT_CB_ID and HAL_MMC_MSP_DEINIT_CB_ID.

HAL_MMC_ConfigWideBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigWideBusOperation (MMC_HandleTypeDef * hmmc, uint32_t WideMode)

Function description

Enables wide bus operation for the requested card if supported by card.

Parameters

- **hmmc:** Pointer to MMC handle
- **WideMode:** Specifies the MMC card wide bus mode This parameter can be one of the following values:
  - SDMMC_BUS_WIDE_8B: 8-bit data transfer
  - SDMMC_BUS_WIDE_4B: 4-bit data transfer
  - SDMMC_BUS_WIDE_1B: 1-bit data transfer

Return values

- **HAL:** status

HAL_MMC_ConfigSpeedBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSpeedBusOperation (MMC_HandleTypeDef * hmmc, uint32_t SpeedMode)

Function description

Configure the speed bus mode.

Parameters

- **hmmc:** Pointer to the MMC handle
- **SpeedMode:** Specifies the MMC card speed bus mode This parameter can be one of the following values:
  - SDMMC_SPEED_MODE_AUTO: Max speed mode supported by the card
  - SDMMC_SPEED_MODE_DEFAULT: Default Speed (MMC @ 26MHz)
  - SDMMC_SPEED_MODE_HIGH: High Speed (MMC @ 52 MHz)
  - SDMMC_SPEED_MODE_DDR: High Speed DDR (MMC DDR @ 52 MHz)

Return values

- **HAL:** status

HAL_MMC_GetCardState

Function name

HAL_MMC_CardStateTypeDef HAL_MMC_GetCardState (MMC_HandleTypeDef * hmmc)

Function description

Gets the current mmc card data state.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **Card:** state

HAL_MMC_GetCardCID

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCID (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCIDTypeDef * pCID)

Function description

Returns information the information of the card which are stored on the CID register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCID:** Pointer to a HAL_MMC_CIDTypedef structure that contains all CID register parameters

Return values

- **HAL:** status

HAL_MMC_GetCardCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCSD (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCSDTypeDef * pCSD)

Function description

Returns information the information of the card which are stored on the CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCSD:** Pointer to a HAL_MMC_CardCSDTypeDef structure that contains all CSD register parameters

Return values

- **HAL:** status

HAL_MMC_GetCardInfo

Function name

HAL_StatusTypeDef HAL_MMC_GetCardInfo (MMC_HandleTypeDef * hmmc, HAL_MMC_CardInfoTypeDef * pCardInfo)

Function description

Gets the MMC card info.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCardInfo:** Pointer to the HAL_MMC_CardInfoTypeDef structure that will contain the MMC card status information

Return values

- **HAL:** status

HAL_MMC_GetCardExtCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardExtCSD (MMC_HandleTypeDef * hmmc, uint32_t * pExtCSD, uint32_t Timeout)

Function description

Returns information the information of the card which are stored on the Extended CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pExtCSD:** Pointer to a memory area (512 bytes) that contains all Extended CSD register parameters
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_GetState

Function name

HAL_MMC_StateTypeDef HAL_MMC_GetState (const MMC_HandleTypeDef * hmmc)

Function description

return the MMC state

Parameters

- **hmmc:** Pointer to mmc handle

Return values

- **HAL:** state

HAL_MMC_GetError

Function name

uint32_t HAL_MMC_GetError (const MMC_HandleTypeDef * hmmc)

Function description

Return the MMC error code.

Parameters

- **hmmc:** : Pointer to a MMC_HandleTypeDef structure that contains the configuration information.

Return values

- **MMC:** Error Code

HAL_MMC_Abort

Function name

HAL_StatusTypeDef HAL_MMC_Abort (MMC_HandleTypeDef * hmmc)

Function description

Abort the current transfer and disable the MMC.

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure that contains the configuration information for MMC module.

Return values

- **HAL:** status

HAL_MMC_Abort_IT

Function name

HAL_StatusTypeDef HAL_MMC_Abort_IT (MMC_HandleTypeDef * hmmc)

Function description

Abort the current transfer and disable the MMC (IT mode).

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure that contains the configuration information for MMC module.

Return values

- **HAL:** status

HAL_MMC_EraseSequence

Function name

HAL_StatusTypeDef HAL_MMC_EraseSequence (MMC_HandleTypeDef * hmmc, uint32_t EraseType, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

Perform specific commands sequence for the different type of erase.

Parameters

- **hmmc:** Pointer to MMC handle
- **EraseType:** Specifies the type of erase to be performed This parameter can be one of the following values:
  - HAL_MMC_TRIM Erase the write blocks identified by CMD35 & 36
  - HAL_MMC_ERASE Erase the erase groups identified by CMD35 & 36
  - HAL_MMC_DISCARD Discard the write blocks identified by CMD35 & 36
  - HAL_MMC_SECURE_ERASE Perform a secure purge according SRT on the erase groups identified by CMD35 & 36
  - HAL_MMC_SECURE_TRIM_STEP1 Mark the write blocks identified by CMD35 & 36 for secure erase
  - HAL_MMC_SECURE_TRIM_STEP2 Perform a secure purge according SRT on the write blocks previously identified
- **BlockStartAdd:** Start Block address
- **BlockEndAdd:** End Block address

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_Sanitize

Function name

HAL_StatusTypeDef HAL_MMC_Sanitize (MMC_HandleTypeDef * hmmc)

Function description

Perform sanitize operation on the device.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_ConfigSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t SRTMode)

Function description

Configure the Secure Removal Type (SRT) in the Extended CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **SRTMode:** Specifies the type of erase to be performed This parameter can be one of the following values:
  - HAL_MMC_SRT_ERASE Information removed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_ERASE Information removed by an overwriting with a character followed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM Information removed by an overwriting with a character, its complement then a random character
  - HAL_MMC_SRT_VENDOR_DEFINED Information removed using a vendor defined

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_GetSupportedSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_GetSupportedSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t * SupportedSRT)

Function description

Gets the supported values of the the Secure Removal Type (SRT).

Parameters

- **hmmc:** pointer to MMC handle
- **SupportedSRT:** pointer for supported SRT value This parameter is a bit field of the following values:
  - HAL_MMC_SRT_ERASE Information removed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_ERASE Information removed by an overwriting with a character followed by an erase
  - HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM Information removed by an overwriting with a character, its complement then a random character
  - HAL_MMC_SRT_VENDOR_DEFINED Information removed using a vendor defined

Return values

- **HAL:** status

HAL_MMC_SleepDevice

Function name

HAL_StatusTypeDef HAL_MMC_SleepDevice (MMC_HandleTypeDef * hmmc)

Function description

Switch the device from Standby State to Sleep State.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_AwakeDevice

Function name

HAL_StatusTypeDef HAL_MMC_AwakeDevice (MMC_HandleTypeDef * hmmc)

Function description

Switch the device from Sleep State to Standby State.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **HAL:** status

45.3 MMC Firmware driver defines

The following section lists the various define and macros of the module.

45.3.1 MMC

MMC

MMC Error status enumeration Structure definition

HAL_MMC_ERROR_NONE

No error

HAL_MMC_ERROR_CMD_CRC_FAIL

Command response received (but CRC check failed)

HAL_MMC_ERROR_DATA_CRC_FAIL

Data block sent/received (CRC check failed)

HAL_MMC_ERROR_CMD_RSP_TIMEOUT

Command response timeout

HAL_MMC_ERROR_DATA_TIMEOUT

Data timeout

HAL_MMC_ERROR_TX_UNDERRUN

Transmit FIFO underrun

HAL_MMC_ERROR_RX_OVERRUN

Receive FIFO overrun

HAL_MMC_ERROR_ADDR_MISALIGNED

Misaligned address

HAL_MMC_ERROR_BLOCK_LEN_ERR

Transferred block length is not allowed for the card or the number of transferred bytes does not match the block length

HAL_MMC_ERROR_ERASE_SEQ_ERR

An error in the sequence of erase command occurs

HAL_MMC_ERROR_BAD_ERASE_PARAM

An invalid selection for erase groups

HAL_MMC_ERROR_WRITE_PROT_VIOLATION

Attempt to program a write protect block

HAL_MMC_ERROR_LOCK_UNLOCK_FAILED

Sequence or password error has been detected in unlock command or if there was an attempt to access a locked card

HAL_MMC_ERROR_COM_CRC_FAILED

CRC check of the previous command failed

HAL_MMC_ERROR_ILLEGAL_CMD

Command is not legal for the card state

HAL_MMC_ERROR_CARD_ECC_FAILED

Card internal ECC was applied but failed to correct the data

HAL_MMC_ERROR_CC_ERR

Internal card controller error

HAL_MMC_ERROR_GENERAL_UNKNOWN_ERR

General or unknown error

HAL_MMC_ERROR_STREAM_READ_UNDERRUN

The card could not sustain data reading in stream rmode

HAL_MMC_ERROR_STREAM_WRITE_OVERRUN

The card could not sustain data programming in stream mode

HAL_MMC_ERROR_CID_CSD_OVERWRITE

CID/CSD overwrite error

HAL_MMC_ERROR_WP_ERASE_SKIP

Only partial address space was erased

HAL_MMC_ERROR_CARD_ECC_DISABLED

Command has been executed without using internal ECC

HAL_MMC_ERROR_ERASE_RESET

Erase sequence was cleared before executing because an out of erase sequence command was received

HAL_MMC_ERROR_AKE_SEQ_ERR

Error in sequence of authentication

HAL_MMC_ERROR_INVALID_VOLTRANGE

Error in case of invalid voltage range

HAL_MMC_ERROR_ADDR_OUT_OF_RANGE

Error when addressed block is out of range

HAL_MMC_ERROR_REQUEST_NOT_APPLICABLE

Error when command request is not applicable

HAL_MMC_ERROR_PARAM

the used parameter is not valid

HAL_MMC_ERROR_UNSUPPORTED_FEATURE

Error when feature is not insupported

HAL_MMC_ERROR_BUSY

Error when transfer process is busy

HAL_MMC_ERROR_DMA

Error while DMA transfer

HAL_MMC_ERROR_TIMEOUT

Timeout error

HAL_MMC_ERROR_INVALID_CALLBACK

Invalid callback error

MMC context enumeration

MMC_CONTEXT_NONE

None

MMC_CONTEXT_READ_SINGLE_BLOCK

Read single block operation

MMC_CONTEXT_READ_MULTIPLE_BLOCK

Read multiple blocks operation

MMC_CONTEXT_WRITE_SINGLE_BLOCK

Write single block operation

MMC_CONTEXT_WRITE_MULTIPLE_BLOCK

Write multiple blocks operation

MMC_CONTEXT_IT

Process in Interrupt mode

MMC_CONTEXT_DMA

Process in DMA mode

MMC Voltage mode

MMC_HIGH_VOLTAGE_RANGE

High voltage in byte mode

MMC_DUAL_VOLTAGE_RANGE

Dual voltage in byte mode

MMC_LOW_VOLTAGE_RANGE

Low voltage in byte mode

EMMC_HIGH_VOLTAGE_RANGE

High voltage in sector mode

EMMC_DUAL_VOLTAGE_RANGE

Dual voltage in sector mode

EMMC_LOW_VOLTAGE_RANGE

Low voltage in sector mode

MMC_INVALID_VOLTAGE_RANGE

MMC Memory Cards

MMC_LOW_CAPACITY_CARD

MMC Card Capacity <=2Gbytes

MMC_HIGH_CAPACITY_CARD

MMC Card Capacity >2Gbytes and <2Tbytes

MMC Erase Type

HAL_MMC_ERASE

Erase the erase groups identified by CMD35 & 36

HAL_MMC_TRIM

Erase the write blocks identified by CMD35 & 36

HAL_MMC_DISCARD

Discard the write blocks identified by CMD35 & 36

HAL_MMC_SECURE_ERASE

Perform a secure purge according SRT on the erase groups identified by CMD35 & 36

HAL_MMC_SECURE_TRIM_STEP1

Mark the write blocks identified by CMD35 & 36 for secure erase

HAL_MMC_SECURE_TRIM_STEP2

Perform a secure purge according SRT on the write blocks previously identified

IS_MMC_ERASE_TYPE

MMC Secure Removal Type

HAL_MMC_SRT_ERASE

Information removed by an erase

HAL_MMC_SRT_WRITE_CHAR_ERASE

Information removed by an overwriting with a character followed by an erase

HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM

Information removed by an overwriting with a character, its complement then a random character

HAL_MMC_SRT_VENDOR_DEFINED

Information removed using a vendor defined

IS_MMC_SRT_TYPE

Exported Constants

MMC_BLOCKSIZE

Block size is 512 bytes

MMC Exported Macros

__HAL_MMC_RESET_HANDLE_STATE

Description:

- Reset MMC handle state.

Parameters:

- __HANDLE__: MMC Handle.

Return value:

- None

__HAL_MMC_ENABLE_IT

Description:

- Enable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_DISABLE_IT

Description:

- Disable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_GET_FLAG

Description:

- Check whether the specified MMC flag is set or not.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_DPSMACT: Data path state machine active
  - SDMMC_FLAG_CPSMACT: Command path state machine active
  - SDMMC_FLAG_TXFIFOHE: Transmit FIFO Half Empty
  - SDMMC_FLAG_RXFIFOHF: Receive FIFO Half Full
  - SDMMC_FLAG_TXFIFOF: Transmit FIFO full
  - SDMMC_FLAG_RXFIFOF: Receive FIFO full
  - SDMMC_FLAG_TXFIFOE: Transmit FIFO empty
  - SDMMC_FLAG_RXFIFOE: Receive FIFO empty
  - SDMMC_FLAG_BUSYD0: Inverted value of SDMMC_D0 line (Busy)
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- The: new state of MMC FLAG (SET or RESET).

__HAL_MMC_CLEAR_FLAG

Description:

- Clear the MMC's pending flags.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to clear. This parameter can be one or a combination of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- None

__HAL_MMC_GET_IT

Description:

- Check whether the specified MMC interrupt has occurred or not.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt source to check. This parameter can be one of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- The: new state of MMC IT (SET or RESET).

__HAL_MMC_CLEAR_IT

Description:

- Clear the MMC's interrupt pending bits.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

46 HAL MMC Extension Driver

46.1 MMCEx Firmware driver API description

The following section lists the various functions of the MMCEx library.

46.1.1 How to use this driver

The MMC Extension HAL driver can be used as follows:

- Configure Buffer0 and Buffer1 start address and Buffer size using HAL_MMCEx_ConfigDMAMultiBuffer() function.
- Start Read and Write for multibuffer mode using HAL_MMCEx_ReadBlocksDMAMultiBuffer() and HAL_MMCEx_WriteBlocksDMAMultiBuffer() functions.

46.1.2 Linked List management functions

This subsection provides a set of functions allowing to manage the needed functions.

This section contains the following APIs:

- *HAL_MMCEx_DMALinkedList_BuildNode()*
- *HAL_MMCEx_DMALinkedList_InsertNode()*
- *HAL_MMCEx_DMALinkedList_RemoveNode()*
- *HAL_MMCEx_DMALinkedList_LockNode()*
- *HAL_MMCEx_DMALinkedList_UnlockNode()*
- *HAL_MMCEx_DMALinkedList_EnableCircularMode()*
- *HAL_MMCEx_DMALinkedList_DisableCircularMode()*
- *HAL_MMCEx_DMALinkedList_ReadBlocks()*
- *HAL_MMCEx_DMALinkedList_WriteBlocks()*
- *HAL_MMCEx_DMALinkedList_ReadBlocks()*
- *HAL_MMCEx_DMALinkedList_WriteBlocks()*
- *HAL_MMCEx_DMALinkedList_EnableCircularMode()*
- *HAL_MMCEx_DMALinkedList_DisableCircularMode()*
- *HAL_MMCEx_Read_DMALnkLstBufCpltCallback()*
- *HAL_MMCEx_Write_DMALnkLstBufCpltCallback()*

46.1.3 Detailed description of functions

HAL_MMCEx_DMALinkedList_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_ReadBlocks (MMC_HandleTypeDef * hmmc, SDMMC_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMCEx_DMALinkedList_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_WriteBlocks (MMC_HandleTypeDef * hmmc, SDMMC_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMCEx_DMALinkedList_BuildNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_BuildNode (MMC_DMALinkNodeTypeDef * pNode, MMC_DMALinkNodeConfTypeDef * pNodeConf)

Function description

Build Linked List node.

Parameters

- **pNode:** Pointer to new node to add.
- **pNodeConf:** Pointer to configuration parameters for new node to add.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_InsertNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_InsertNode (MMC_DMALinkedListTypeDef * pLinkedList, MMC_DMALinkNodeTypeDef * pPrevNode, MMC_DMALinkNodeTypeDef * pNewNode)

Function description

Insert Linked List node.

Parameters

- **pLinkedList:** Pointer to the linkedlist that contains transfer nodes
- **pPrevNode:** Pointer to previous node.
- **pNewNode:** Pointer to new node to insert.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_RemoveNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_RemoveNode (MMC_DMALinkedListTypeDef * pLinkedList, MMC_DMALinkNodeTypeDef * pNode)

Function description

Remove Linked List node.

Parameters

- **pLinkedList:** Pointer to the linkedlist that contains transfer nodes
- **pNode:** Pointer to node to remove.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_LockNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_LockNode (MMC_DMALinkNodeTypeDef * pNode)

Function description

Lock Linked List node.

Parameters

- **pNode:** Pointer to node to remove.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_UnlockNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_UnlockNode (MMC_DMALinkNodeTypeDef * pNode)

Function description

Unlock Linked List node.

Parameters

- **pNode:** Pointer to node to remove.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_EnableCircularMode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_EnableCircularMode (SDMMC_DMALinkedListTypeDef * pLinkedList)

Function description

HAL_MMCEx_DMALinkedList_DisableCircularMode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_DisableCircularMode (SDMMC_DMALinkedListTypeDef * pLinkedList)

Function description

HAL_MMCEx_Read_DMALnkLstBufCpltCallback

Function name

void HAL_MMCEx_Read_DMALnkLstBufCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Read DMA Linked list node Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

HAL_MMCEx_Write_DMALnkLstBufCpltCallback

Function name

void HAL_MMCEx_Write_DMALnkLstBufCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Read DMA Linked list node Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

46.2 MMCEx Firmware driver defines

The following section lists the various define and macros of the module.

46.2.1 MMCEx

MMCEx

Linked List Wrapper

MMC_DMALinkNodeTypeDef

MMC_DMALinkNodeConfTypeDef

MMC_DMALinkedListTypeDef

47 HAL NAND Generic Driver

47.1 NAND Firmware driver registers structures

47.1.1 NAND_IDTypeDef

NAND_IDTypeDef is defined in the stm32h5xx_hal_nand.h

Data Fields

- ***uint8_t Maker_Id***
- ***uint8_t Device_Id***
- ***uint8_t Third_Id***
- ***uint8_t Fourth_Id***

Field Documentation

- ***uint8_t NAND_IDTypeDef::Maker_Id***
- ***uint8_t NAND_IDTypeDef::Device_Id***
- ***uint8_t NAND_IDTypeDef::Third_Id***
- ***uint8_t NAND_IDTypeDef::Fourth_Id***

47.1.2 NAND_AddressTypeDef

NAND_AddressTypeDef is defined in the stm32h5xx_hal_nand.h

Data Fields

- ***uint16_t Page***
- ***uint16_t Plane***
- ***uint16_t Block***

Field Documentation

- ***uint16_t NAND_AddressTypeDef::Page***
  NAND memory Page address
- ***uint16_t NAND_AddressTypeDef::Plane***
  NAND memory Zone address
- ***uint16_t NAND_AddressTypeDef::Block***
  NAND memory Block address

47.1.3 NAND_DeviceConfigTypeDef

NAND_DeviceConfigTypeDef is defined in the stm32h5xx_hal_nand.h

Data Fields

- ***uint32_t PageSize***
- ***uint32_t SpareAreaSize***
- ***uint32_t BlockSize***
- ***uint32_t BlockNbr***
- ***uint32_t PlaneNbr***
- ***uint32_t PlaneSize***
- ***FunctionalState ExtraCommandEnable***

Field Documentation

- ***uint32_t NAND_DeviceConfigTypeDef::PageSize***
  NAND memory page (without spare area) size measured in bytes for 8 bits addressing or words for 16 bits addressing
- ***uint32_t NAND_DeviceConfigTypeDef::SpareAreaSize***
  NAND memory spare area size measured in bytes for 8 bits addressing or words for 16 bits addressing
- ***uint32_t NAND_DeviceConfigTypeDef::BlockSize***
  NAND memory block size measured in number of pages

- ***uint32_t NAND_DeviceConfigTypeDef::BlockNbr***
  NAND memory number of total blocks
- ***uint32_t NAND_DeviceConfigTypeDef::PlaneNbr***
  NAND memory number of planes
- ***uint32_t NAND_DeviceConfigTypeDef::PlaneSize***
  NAND memory zone size measured in number of blocks
- ***FunctionalState NAND_DeviceConfigTypeDef::ExtraCommandEnable***
  NAND extra command needed for Page reading mode. This parameter is mandatory for some NAND parts after the read command (NAND_CMD_AREA_TRUE1) and before DATA reading sequence. Example: Toshiba THTH58BYG3S0HBAI6. This parameter could be ENABLE or DISABLE Please check the Read Mode sequence in the NAND device datasheet

47.1.4 __NAND_HandleTypeDef

__NAND_HandleTypeDef is defined in the stm32h5xx_hal_nand.h

Data Fields

- ***FMC_NAND_TypeDef * Instance***
- ***FMC_NAND_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_NAND_StateTypeDef State***
- ***NAND_DeviceConfigTypeDef Config***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***void(* ItCallback***

Field Documentation

- ***FMC_NAND_TypeDef* __NAND_HandleTypeDef::Instance***
  Register base address
- ***FMC_NAND_InitTypeDef __NAND_HandleTypeDef::Init***
  NAND device control configuration parameters
- ***HAL_LockTypeDef __NAND_HandleTypeDef::Lock***
  NAND locking object
- ***__IO HAL_NAND_StateTypeDef __NAND_HandleTypeDef::State***
  NAND device access state
- ***NAND_DeviceConfigTypeDef __NAND_HandleTypeDef::Config***
  NAND physical characteristic information structure
- ***void(* __NAND_HandleTypeDef::MspInitCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND Msp Init callback
- ***void(* __NAND_HandleTypeDef::MspDeInitCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND Msp DeInit callback
- ***void(* __NAND_HandleTypeDef::ItCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND IT callback

47.2 NAND Firmware driver API description

The following section lists the various functions of the NAND library.

47.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NAND flash memories. It uses the FMC layer functions to interface with NAND devices. This driver is used as follows:

- NAND flash memory configuration sequence using the function HAL_NAND_Init() with control and timing parameters for both common and attribute spaces.
- Read NAND flash memory maker and device IDs using the function HAL_NAND_Read_ID(). The read information is stored in the NAND_ID_TypeDef structure declared by the function caller.

- Access NAND flash memory by read/write operations using the functions HAL_NAND_Read_Page_8b()/ HAL_NAND_Read_SpareArea_8b(), HAL_NAND_Write_Page_8b()/HAL_NAND_Write_SpareArea_8b(), HAL_NAND_Read_Page_16b()/HAL_NAND_Read_SpareArea_16b(), HAL_NAND_Write_Page_16b()/ HAL_NAND_Write_SpareArea_16b() to read/write page(s)/spare area(s). These functions use specific device information (Block, page size..) predefined by the user in the NAND_DeviceConfigTypeDef structure. The read/write address information is contained by the Nand_Address_Typedef structure passed as parameter.
- Perform NAND flash Reset chip operation using the function HAL_NAND_Reset().
- Perform NAND flash erase block operation using the function HAL_NAND_Erase_Block(). The erase block address information is contained in the Nand_Address_Typedef structure passed as parameter.
- Read the NAND flash status operation using the function HAL_NAND_Read_Status().
- You can also control the NAND device by calling the control APIs HAL_NAND_ECC_Enable()/ HAL_NAND_ECC_Disable() to respectively enable/disable the ECC code correction feature or the function HAL_NAND_GetECC() to get the ECC correction code.
- You can monitor the NAND device HAL state by calling the function HAL_NAND_GetState()

Note: This driver is a set of generic APIs which handle standard NAND flash operations. If a NAND flash device contains different operations and/or implementations, it should be implemented separately.

Callback registration

The compilation define USE_HAL_NAND_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NAND_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NAND_UnRegisterCallback() to reset a callback to the default weak function. It allows to reset following callbacks:
- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NAND_Init and if the state is HAL_NAND_STATE_RESET all callbacks are reset to the corresponding legacy weak functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the HAL_NAND_Init and HAL_NAND_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NAND_Init and HAL_NAND_DeInit keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NAND_RegisterCallback before calling HAL_NAND_DeInit or HAL_NAND_Init function. When The compilation define USE_HAL_NAND_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

47.2.2 NAND Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the NAND memory

This section contains the following APIs:

- ***HAL_NAND_Init()***
- ***HAL_NAND_DeInit()***
- ***HAL_NAND_MspInit()***
- ***HAL_NAND_MspDeInit()***
- ***HAL_NAND_IRQHandler()***
- ***HAL_NAND_ITCallback()***
- ***HAL_NAND_ConfigDevice()***
- ***HAL_NAND_Read_ID()***

47.2.3 NAND Input and Output functions

This section provides functions allowing to use and control the NAND memory

This section contains the following APIs:

- *HAL_NAND_Read_ID()*
- *HAL_NAND_Reset()*
- *HAL_NAND_ConfigDevice()*
- *HAL_NAND_Read_Page_8b()*
- *HAL_NAND_Read_Page_16b()*
- *HAL_NAND_Write_Page_8b()*
- *HAL_NAND_Write_Page_16b()*
- *HAL_NAND_Read_SpareArea_8b()*
- *HAL_NAND_Read_SpareArea_16b()*
- *HAL_NAND_Write_SpareArea_8b()*
- *HAL_NAND_Write_SpareArea_16b()*
- *HAL_NAND_Erase_Block()*
- *HAL_NAND_Address_Inc()*
- *HAL_NAND_RegisterCallback()*
- *HAL_NAND_UnRegisterCallback()*

47.2.4 NAND Control functions

This subsection provides a set of functions allowing to control dynamically the NAND interface.

This section contains the following APIs:

- *HAL_NAND_ECC_Enable()*
- *HAL_NAND_ECC_Disable()*
- *HAL_NAND_GetECC()*

47.2.5 NAND State functions

This subsection permits to get in run-time the status of the NAND controller and the data flow.

This section contains the following APIs:

- *HAL_NAND_GetState()*
- *HAL_NAND_Read_Status()*

47.2.6 Detailed description of functions

HAL_NAND_Init

Function name

HAL_StatusTypeDef HAL_NAND_Init (NAND_HandleTypeDef * hnand, FMC_NAND_PCC_TimingTypeDef * ComSpace_Timing, FMC_NAND_PCC_TimingTypeDef * AttSpace_Timing)

Function description

Perform NAND memory Initialization sequence.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **ComSpace_Timing:** pointer to Common space timing structure
- **AttSpace_Timing:** pointer to Attribute space timing structure

Return values

- **HAL:** status

HAL_NAND_DeInit

Function name

HAL_StatusTypeDef HAL_NAND_DeInit (NAND_HandleTypeDef * hnand)

Function description

Perform NAND memory De-Initialization sequence.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ConfigDevice

Function name

HAL_StatusTypeDef HAL_NAND_ConfigDevice (NAND_HandleTypeDef * hnand, NAND_DeviceConfigTypeDef * pDeviceConfig)

Function description

Configure the device: Enter the physical parameters of the device.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pDeviceConfig:** pointer to NAND_DeviceConfigTypeDef structure

Return values

- **HAL:** status

HAL_NAND_Read_ID

Function name

HAL_StatusTypeDef HAL_NAND_Read_ID (NAND_HandleTypeDef * hnand, NAND_IDTypeDef * pNAND_ID)

Function description

Read the NAND memory electronic signature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pNAND_ID:** NAND ID structure

Return values

- **HAL:** status

HAL_NAND_MspInit

Function name

void HAL_NAND_MspInit (NAND_HandleTypeDef * hnand)

Function description

NAND MSP Init.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_MspDeInit

Function name

void HAL_NAND_MspDeInit (NAND_HandleTypeDef * hnand)

Function description

NAND MSP DeInit.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_IRQHandler

Function name

void HAL_NAND_IRQHandler (NAND_HandleTypeDef * hnand)

Function description

This function handles NAND device interrupt request.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ITCallback

Function name

void HAL_NAND_ITCallback (NAND_HandleTypeDef * hnand)

Function description

NAND interrupt feature callback.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_Reset

Function name

HAL_StatusTypeDef HAL_NAND_Reset (NAND_HandleTypeDef * hnand)

Function description

NAND memory reset.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_Read_Page_8b

Function name

HAL_StatusTypeDef HAL_NAND_Read_Page_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumPageToRead)

Function description

Read Page(s) from NAND memory block (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to destination read buffer
- **NumPageToRead:** number of pages to read from block

Return values

- **HAL:** status

HAL_NAND_Write_Page_8b

Function name

HAL_StatusTypeDef HAL_NAND_Write_Page_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumPageToWrite)

Function description

Write Page(s) to NAND memory block (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumPageToWrite:** number of pages to write to block

Return values

- **HAL:** status

HAL_NAND_Read_SpareArea_8b

Function name

HAL_StatusTypeDef HAL_NAND_Read_SpareArea_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumSpareAreaToRead)

Function description

Read Spare area(s) from NAND memory (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumSpareAreaToRead:** Number of spare area to read

Return values

- **HAL:** status

HAL_NAND_Write_SpareArea_8b

Function name

HAL_StatusTypeDef HAL_NAND_Write_SpareArea_8b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumSpareAreaTowrite)

Function description

Write Spare area(s) to NAND memory (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumSpareAreaTowrite:** number of spare areas to write to block

Return values

- **HAL:** status

HAL_NAND_Read_Page_16b

Function name

HAL_StatusTypeDef HAL_NAND_Read_Page_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumPageToRead)

Function description

Read Page(s) from NAND memory block (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to destination read buffer. pBuffer should be 16bits aligned
- **NumPageToRead:** number of pages to read from block

Return values

- **HAL:** status

HAL_NAND_Write_Page_16b

Function name

HAL_StatusTypeDef HAL_NAND_Write_Page_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumPageToWrite)

Function description

Write Page(s) to NAND memory block (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned
- **NumPageToWrite:** number of pages to write to block

Return values

- **HAL:** status

HAL_NAND_Read_SpareArea_16b

Function name

HAL_StatusTypeDef HAL_NAND_Read_SpareArea_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumSpareAreaToRead)

Function description

Read Spare area(s) from NAND memory (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned.
- **NumSpareAreaToRead:** Number of spare area to read

Return values

- **HAL:** status

HAL_NAND_Write_SpareArea_16b

Function name

HAL_StatusTypeDef HAL_NAND_Write_SpareArea_16b (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumSpareAreaTowrite)

Function description

Write Spare area(s) to NAND memory (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned.
- **NumSpareAreaTowrite:** number of spare areas to write to block

Return values

- **HAL:** status

HAL_NAND_Erase_Block

Function name

HAL_StatusTypeDef HAL_NAND_Erase_Block (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress)

Function description

NAND memory Block erase.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure

Return values

- **HAL:** status

HAL_NAND_Address_Inc

Function name

uint32_t HAL_NAND_Address_Inc (NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress)

Function description

Increment the NAND memory address.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure

Return values

- **The:** new status of the increment address operation. It can be:
  - NAND_VALID_ADDRESS: When the new address is valid address
  - NAND_INVALID_ADDRESS: When the new address is invalid address

HAL_NAND_RegisterCallback

Function name

HAL_StatusTypeDef HAL_NAND_RegisterCallback (NAND_HandleTypeDef * hnand, HAL_NAND_CallbackIDTypeDef CallbackId, pNAND_CallbackTypeDef pCallback)

Function description

Register a User NAND Callback To be used instead of the weak predefined callback.

Parameters

- **hnand:** : NAND handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_NAND_MSP_INIT_CB_ID NAND MspInit callback ID
  - HAL_NAND_MSP_DEINIT_CB_ID NAND MspDeInit callback ID
  - HAL_NAND_IT_CB_ID NAND IT callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_NAND_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_NAND_UnRegisterCallback (NAND_HandleTypeDef * hnand, HAL_NAND_CallbackIDTypeDef CallbackId)

Function description

Unregister a User NAND Callback NAND Callback is redirected to the weak predefined callback.

Parameters

- **hnand:** : NAND handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_NAND_MSP_INIT_CB_ID NAND MspInit callback ID
  - HAL_NAND_MSP_DEINIT_CB_ID NAND MspDeInit callback ID
  - HAL_NAND_IT_CB_ID NAND IT callback ID

Return values

- **status:**

HAL_NAND_ECC_Enable

Function name

HAL_StatusTypeDef HAL_NAND_ECC_Enable (NAND_HandleTypeDef * hnand)

Function description

Enables dynamically NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ECC_Disable

Function name

HAL_StatusTypeDef HAL_NAND_ECC_Disable (NAND_HandleTypeDef * hnand)

Function description

Disables dynamically FMC_NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_GetECC

Function name

HAL_StatusTypeDef HAL_NAND_GetECC (NAND_HandleTypeDef * hnand, uint32_t * ECCval, uint32_t Timeout)

Function description

Disables dynamically NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **ECCval:** pointer to ECC value
- **Timeout:** maximum timeout to wait

Return values

- **HAL:** status

HAL_NAND_GetState

Function name

HAL_NAND_StateTypeDef HAL_NAND_GetState (NAND_HandleTypeDef * hnand)

Function description

return the NAND state

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** state

HAL_NAND_Read_Status

Function name

uint32_t HAL_NAND_Read_Status (NAND_HandleTypeDef * hnand)

Function description

NAND memory read status.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **NAND:** status

47.3 NAND Firmware driver defines

The following section lists the various define and macros of the module.

47.3.1 NAND

NAND

NAND Exported Macros

__HAL_NAND_RESET_HANDLE_STATE

Description:

- Reset NAND handle state.

Parameters:

- __HANDLE__: specifies the NAND handle.

Return value:

- None

48 HAL NOR Generic Driver

48.1 NOR Firmware driver registers structures

48.1.1 NOR_IDTypeDef

NOR_IDTypeDef is defined in the stm32h5xx_hal_nor.h

Data Fields

- ***uint16_t Manufacturer_Code***
- ***uint16_t Device_Code1***
- ***uint16_t Device_Code2***
- ***uint16_t Device_Code3***

Field Documentation

- ***uint16_t NOR_IDTypeDef::Manufacturer_Code***
  Defines the device's manufacturer code used to identify the memory
- ***uint16_t NOR_IDTypeDef::Device_Code1***
- ***uint16_t NOR_IDTypeDef::Device_Code2***
- ***uint16_t NOR_IDTypeDef::Device_Code3***
  Defines the device's codes used to identify the memory. These codes can be accessed by performing read operations with specific control signals and addresses set.They can also be accessed by issuing an Auto Select command

48.1.2 NOR_CFITypeDef

NOR_CFITypeDef is defined in the stm32h5xx_hal_nor.h

Data Fields

- ***uint16_t CFI_1***
- ***uint16_t CFI_2***
- ***uint16_t CFI_3***
- ***uint16_t CFI_4***

Field Documentation

- ***uint16_t NOR_CFITypeDef::CFI_1***
  < Defines the information stored in the memory's Common flash interface which contains a description of various electrical and timing parameters, density information and functions supported by the memory
- ***uint16_t NOR_CFITypeDef::CFI_2***
- ***uint16_t NOR_CFITypeDef::CFI_3***
- ***uint16_t NOR_CFITypeDef::CFI_4***

48.1.3 __NOR_HandleTypeDef

__NOR_HandleTypeDef is defined in the stm32h5xx_hal_nor.h

Data Fields

- ***FMC_NORSRAM_TypeDef * Instance***
- ***FMC_NORSRAM_EXTENDED_TypeDef * Extended***
- ***FMC_NORSRAM_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_NOR_StateTypeDef State***
- ***uint32_t CommandSet***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***FMC_NORSRAM_TypeDef* __NOR_HandleTypeDef::Instance***
  Register base address
- ***FMC_NORSRAM_EXTENDED_TypeDef* __NOR_HandleTypeDef::Extended***
  Extended mode register base address
- ***FMC_NORSRAM_InitTypeDef __NOR_HandleTypeDef::Init***
  NOR device control configuration parameters
- ***HAL_LockTypeDef __NOR_HandleTypeDef::Lock***
  NOR locking object
- ***__IO HAL_NOR_StateTypeDef __NOR_HandleTypeDef::State***
  NOR device access state
- ***uint32_t __NOR_HandleTypeDef::CommandSet***
  NOR algorithm command set and control
- ***void(* __NOR_HandleTypeDef::MspInitCallback)(struct __NOR_HandleTypeDef *hnor)***
  NOR Msp Init callback
- ***void(* __NOR_HandleTypeDef::MspDeInitCallback)(struct __NOR_HandleTypeDef *hnor)***
  NOR Msp DeInit callback

48.2 NOR Firmware driver API description

The following section lists the various functions of the NOR library.

48.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NOR flash memories. It uses the FMC layer functions to interface with NOR devices. This driver is used as follows:

- NOR flash memory configuration sequence using the function HAL_NOR_Init() with control and timing parameters for both normal and extended mode.
- Read NOR flash memory manufacturer code and device IDs using the function HAL_NOR_Read_ID(). The read information is stored in the NOR_ID_TypeDef structure declared by the function caller.
- Access NOR flash memory by read/write data unit operations using the functions HAL_NOR_Read(), HAL_NOR_Program().
- Perform NOR flash erase block/chip operations using the functions HAL_NOR_Erase_Block() and HAL_NOR_Erase_Chip().
- Read the NOR flash CFI (common flash interface) IDs using the function HAL_NOR_Read_CFI(). The read information is stored in the NOR_CFI_TypeDef structure declared by the function caller.
- You can also control the NOR device by calling the control APIs HAL_NOR_WriteOperation_Enable()/ HAL_NOR_WriteOperation_Disable() to respectively enable/disable the NOR write operation
- You can monitor the NOR device HAL state by calling the function HAL_NOR_GetState()

Note: This driver is a set of generic APIs which handle standard NOR flash operations. If a NOR flash device contains different operations and/or implementations, it should be implemented separately.

NOR HAL driver macros list

Below the list of most used macros in NOR HAL driver.

- NOR_WRITE : NOR memory write data to specified address

Callback registration

The compilation define USE_HAL_NOR_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NOR_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NOR MspInit.
- MspDeInitCallback : NOR MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NOR_UnRegisterCallback() to reset a callback to the default weak function. It allows to reset following callbacks:
- MspInitCallback : NOR MspInit.

- MspDeInitCallback : NOR MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NOR_Init and if the state is HAL_NOR_STATE_RESET all callbacks are reset to the corresponding legacy weak functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the HAL_NOR_Init and HAL_NOR_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NOR_Init and HAL_NOR_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NOR_RegisterCallback before calling HAL_NOR_DeInit or HAL_NOR_Init function. When The compilation define USE_HAL_NOR_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

48.2.2 NOR Initialization and de_initialization functions

This section provides functions allowing to initialize/de-initialize the NOR memory

This section contains the following APIs:

- ***HAL_NOR_Init()***
- ***HAL_NOR_DeInit()***
- ***HAL_NOR_MspInit()***
- ***HAL_NOR_MspDeInit()***
- ***HAL_NOR_MspWait()***

48.2.3 NOR Input and Output functions

This section provides functions allowing to use and control the NOR memory

This section contains the following APIs:

- ***HAL_NOR_Read_ID()***
- ***HAL_NOR_ReturnToReadMode()***
- ***HAL_NOR_Read()***
- ***HAL_NOR_Program()***
- ***HAL_NOR_ReadBuffer()***
- ***HAL_NOR_ProgramBuffer()***
- ***HAL_NOR_Erase_Block()***
- ***HAL_NOR_Erase_Chip()***
- ***HAL_NOR_Read_CFI()***
- ***HAL_NOR_RegisterCallback()***
- ***HAL_NOR_UnRegisterCallback()***

48.2.4 NOR Control functions

This subsection provides a set of functions allowing to control dynamically the NOR interface.

This section contains the following APIs:

- ***HAL_NOR_WriteOperation_Enable()***
- ***HAL_NOR_WriteOperation_Disable()***

48.2.5 NOR State functions

This subsection permits to get in run-time the status of the NOR controller and the data flow.

This section contains the following APIs:

- ***HAL_NOR_GetState()***
- ***HAL_NOR_GetStatus()***

48.2.6 Detailed description of functions

HAL_NOR_Init

Function name

HAL_StatusTypeDef HAL_NOR_Init (NOR_HandleTypeDef * hnor, FMC_NORSRAM_TimingTypeDef * Timing, FMC_NORSRAM_TimingTypeDef * ExtTiming)

Function description

Perform the NOR memory Initialization sequence.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timing:** pointer to NOR control timing structure
- **ExtTiming:** pointer to NOR extended mode timing structure

Return values

- **HAL:** status

HAL_NOR_DeInit

Function name

HAL_StatusTypeDef HAL_NOR_DeInit (NOR_HandleTypeDef * hnor)

Function description

Perform NOR memory De-Initialization sequence.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_MspInit

Function name

void HAL_NOR_MspInit (NOR_HandleTypeDef * hnor)

Function description

NOR MSP Init.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **None:**

HAL_NOR_MspDeInit

Function name

void HAL_NOR_MspDeInit (NOR_HandleTypeDef * hnor)

Function description

NOR MSP DeInit.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **None:**

HAL_NOR_MspWait

Function name

void HAL_NOR_MspWait (NOR_HandleTypeDef * hnor, uint32_t Timeout)

Function description

NOR MSP Wait for Ready/Busy signal.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timeout:** Maximum timeout value

Return values

- **None:**

HAL_NOR_Read_ID

Function name

HAL_StatusTypeDef HAL_NOR_Read_ID (NOR_HandleTypeDef * hnor, NOR_IDTypeDef * pNOR_ID)

Function description

Read NOR flash IDs.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pNOR_ID:** pointer to NOR ID structure

Return values

- **HAL:** status

HAL_NOR_ReturnToReadMode

Function name

HAL_StatusTypeDef HAL_NOR_ReturnToReadMode (NOR_HandleTypeDef * hnor)

Function description

Returns the NOR memory to Read mode.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_Read

Function name

HAL_StatusTypeDef HAL_NOR_Read (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)

Function description

Read data from NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pAddress:** pointer to Device address
- **pData:** pointer to read data

Return values

- **HAL:** status

HAL_NOR_Program

Function name

HAL_StatusTypeDef HAL_NOR_Program (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)

Function description

Program data to NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pAddress:** Device address
- **pData:** pointer to the data to write

Return values

- **HAL:** status

HAL_NOR_ReadBuffer

Function name

HAL_StatusTypeDef HAL_NOR_ReadBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)

Function description

Reads a half-word buffer from the NOR memory.

Parameters

- **hnor:** pointer to the NOR handle
- **uwAddress:** NOR memory internal address to read from.
- **pData:** pointer to the buffer that receives the data read from the NOR memory.
- **uwBufferSize:** number of Half word to read.

Return values

- **HAL:** status

HAL_NOR_ProgramBuffer

Function name

HAL_StatusTypeDef HAL_NOR_ProgramBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)

Function description

Writes a half-word buffer to the NOR memory.

Parameters

- **hnor:** pointer to the NOR handle
- **uwAddress:** NOR memory internal start write address
- **pData:** pointer to source data buffer.
- **uwBufferSize:** Size of the buffer to write

Return values

- **HAL:** status

HAL_NOR_Erase_Block

Function name

HAL_StatusTypeDef HAL_NOR_Erase_Block (NOR_HandleTypeDef * hnor, uint32_t BlockAddress, uint32_t Address)

Function description

Erase the specified block of the NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **BlockAddress:** Block to erase address
- **Address:** Device address

Return values

- **HAL:** status

HAL_NOR_Erase_Chip

Function name

HAL_StatusTypeDef HAL_NOR_Erase_Chip (NOR_HandleTypeDef * hnor, uint32_t Address)

Function description

Erase the entire NOR chip.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Address:** Device address

Return values

- **HAL:** status

HAL_NOR_Read_CFI

Function name

HAL_StatusTypeDef HAL_NOR_Read_CFI (NOR_HandleTypeDef * hnor, NOR_CFITypeDef * pNOR_CFI)

Function description

Read NOR flash CFI IDs.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pNOR_CFI:** pointer to NOR CFI IDs structure

Return values

- **HAL:** status

HAL_NOR_RegisterCallback

Function name

HAL_StatusTypeDef HAL_NOR_RegisterCallback (NOR_HandleTypeDef * hnor, HAL_NOR_CallbackIDTypeDef CallbackId, pNOR_CallbackTypeDef pCallback)

Function description

Register a User NOR Callback To be used instead of the weak predefined callback.

Parameters

- **hnor:** : NOR handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_NOR_MSP_INIT_CB_ID NOR MspInit callback ID
  - HAL_NOR_MSP_DEINIT_CB_ID NOR MspDeInit callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_NOR_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_NOR_UnRegisterCallback (NOR_HandleTypeDef * hnor, HAL_NOR_CallbackIDTypeDef CallbackId)

Function description

Unregister a User NOR Callback NOR Callback is redirected to the weak predefined callback.

Parameters

- **hnor:** : NOR handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_NOR_MSP_INIT_CB_ID NOR MspInit callback ID
  - HAL_NOR_MSP_DEINIT_CB_ID NOR MspDeInit callback ID

Return values

- **status:**

HAL_NOR_WriteOperation_Enable

Function name

HAL_StatusTypeDef HAL_NOR_WriteOperation_Enable (NOR_HandleTypeDef * hnor)

Function description

Enables dynamically NOR write operation.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_WriteOperation_Disable

Function name

HAL_StatusTypeDef HAL_NOR_WriteOperation_Disable (NOR_HandleTypeDef * hnor)

Function description

Disables dynamically NOR write operation.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_GetState

Function name

HAL_NOR_StateTypeDef HAL_NOR_GetState (NOR_HandleTypeDef * hnor)

Function description

return the NOR controller state

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **NOR:** controller state

HAL_NOR_GetStatus

Function name

HAL_NOR_StatusTypeDef HAL_NOR_GetStatus (NOR_HandleTypeDef * hnor, uint32_t Address, uint32_t Timeout)

Function description

Returns the NOR operation status.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Address:** Device address
- **Timeout:** NOR programming Timeout

Return values

- **NOR_Status:** The returned value can be: HAL_NOR_STATUS_SUCCESS, HAL_NOR_STATUS_ERROR or HAL_NOR_STATUS_TIMEOUT

48.3 NOR Firmware driver defines

The following section lists the various define and macros of the module.

48.3.1 NOR

NOR

NOR Exported Macros

__HAL_NOR_RESET_HANDLE_STATE

Description:

- Reset NOR handle state.

Parameters:

- __HANDLE__: specifies the NOR handle.

Return value:

- None

49 HAL OPAMP Generic Driver

49.1 OPAMP Firmware driver registers structures

49.1.1 OPAMP_InitTypeDef

OPAMP_InitTypeDef is defined in the stm32h5xx_hal_opamp.h

Data Fields

- ***uint32_t PowerMode***
- ***uint32_t Mode***
- ***uint32_t InvertingInput***
- ***uint32_t NonInvertingInput***
- ***uint32_t PgaGain***
- ***uint32_t PgaConnect***
- ***uint32_t UserTrimming***
- ***uint32_t TrimmingValueP***
- ***uint32_t TrimmingValueN***
- ***uint32_t TrimmingValuePHighSpeed***
- ***uint32_t TrimmingValueNHighSpeed***

Field Documentation

- ***uint32_t OPAMP_InitTypeDef::PowerMode***
  Specifies the power mode Normal or High Speed. This parameter must be a value of ***OPAMP_PowerMode***
- ***uint32_t OPAMP_InitTypeDef::Mode***
  Specifies the OPAMP mode This parameter must be a value of ***OPAMP_Mode*** mode is either Standalone, Follower or PGA
- ***uint32_t OPAMP_InitTypeDef::InvertingInput***
  Specifies the inverting input in Standalone & PGA modes.
  - In Standalone mode i.e when mode is OPAMP_STANDALONE_MODE This parameter must be a value of ***OPAMP_InvertingInput***
  - In Follower mode i.e when mode is OPAMP_FOLLOWER_MODE & In PGA mode i.e when mode is OPAMP_PGA_MODE This parameter is Not Applicable
- ***uint32_t OPAMP_InitTypeDef::NonInvertingInput***
  Specifies the non inverting input of the opamp: This parameter must be a value of ***OPAMP_NonInvertingInput***
- ***uint32_t OPAMP_InitTypeDef::PgaGain***
  Specifies the gain in PGA mode i.e. when mode is OPAMP_PGA_MODE. This parameter must be a value of ***OPAMP_PgaGain***
- ***uint32_t OPAMP_InitTypeDef::PgaConnect***
  Specifies the inverting pin in PGA mode i.e. when mode is OPAMP_PGA_MODE This parameter must be a value of ***OPAMP_PgaConnect*** Either: not connected, connected to VINM0, connected to VINM1 (VINM0 or VINM1 are typically used for external filtering)
- ***uint32_t OPAMP_InitTypeDef::UserTrimming***
  Specifies the trimming mode This parameter must be a value of ***OPAMP_UserTrimming*** UserTrimming is either factory or user trimming.
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueP***
  Specifies the offset trimming value (PMOS) in Normal Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueN***
  Specifies the offset trimming value (NMOS) in Normal Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value

- ***uint32_t OPAMP_InitTypeDef::TrimmingValuePHighSpeed***
  Specifies the offset trimming value (PMOS) in High Speed Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueNHighSpeed***
  Specifies the offset trimming value (NMOS) in High Speed Mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31. 16 is typical default value

49.1.2 __OPAMP_HandleTypeDef

__OPAMP_HandleTypeDef is defined in the stm32h5xx_hal_opamp.h

49.2 OPAMP Firmware driver API description

The following section lists the various functions of the OPAMP library.

49.2.1 OPAMP Peripheral Features

The device integrates one operational amplifiers OPAMP1

1. The OPAMP provides several exclusive running modes.
   – Standalone mode
   – Programmable Gain Amplifier (PGA) modes
   – Follower mode
2. Each OPAMP(s) can be configured in normal and high speed mode.

3. The OPAMP(s) provide(s) calibration capabilities.
   – Calibration aims at correcting some offset for running mode.
   – The OPAMP uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
   – The user defined settings can be figured out using self calibration handled by HAL_OPAMP_SelfCalibrate
   – HAL_OPAMP_SelfCalibrate:
     ◦ Runs automatically the calibration in 2 steps. (90% of VDDA for NMOS transistors, 10% of VDDA for PMOS transistors). (As OPAMP is Rail-to-rail input/output, these 2 steps calibration is appropriate and enough in most cases).
     ◦ Runs automatically the calibration.
     ◦ Enables the user trimming mode
     ◦ Updates the init structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)
4. Running mode: Standalone mode
   – Gain is set externally (gain depends on external loads).
   – Follower mode also possible externally by connecting the inverting input to the output.
5. Running mode: Follower mode
   – No Inverting Input is connected.
6. Running mode: Programmable Gain Amplifier (PGA) mode (Resistor feedback output)
7. The OPAMP(s) output(s) can be internally connected to resistor feedback output.
8. OPAMP gain can be selected as :
   a. Gain of x2, x4, x8 or x16 for non inverting mode with:
      ◦ VREF- referenced.
      ◦ Filtering on VINM0, VREF- referenced.
      ◦ VINM0 node for bias voltage and VINP0 for input signal.
      ◦ VINM0 node for bias voltage and VINP0 for input signal, VINM1 node for filtering.
   b. Gain of x-1, x-3, x-7 or x-15 for inverting mode with:
      ◦ VINM0 node for input signal and VINP0 for bias.
      ◦ VINM0 node for input signal and VINP0 for bias voltage, VINM1 node for filtering.
9. The OPAMPs inverting input can be selected according to the Reference Manual "OPAMP functional description" chapter.
10. The OPAMPs non inverting input can be selected according to the Reference Manual "OPAMP functional description" chapter.

==========

49.2.2 How to use this driver

High speed / normal power mode

To run in high speed mode:

1. Configure the OPAMP using HAL_OPAMP_Init() function:
   – Select OPAMP_POWERMODE_HIGHSPEED
   – Otherwise select OPAMP_POWERMODE_NORMAL

Calibration

To run the OPAMP calibration self calibration:

1. Start calibration using HAL_OPAMP_SelfCalibrate. Store the calibration results.

Running mode

To use the OPAMP, perform the following steps:

1. Fill in the HAL_OPAMP_MspInit() to
   - Enable the OPAMP Peripheral clock using macro __HAL_RCC_OPAMP_CLK_ENABLE()
   - Configure the OPAMP input AND output in analog mode using HAL_GPIO_Init() to map the OPAMP output to the GPIO pin.
2. Registrate Callbacks
   - The compilation define USE_HAL_OPAMP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.
   - Use Functions HAL_OPAMP_RegisterCallback() to register a user callback, it allows to register following callbacks:
     - MspInitCallback : OPAMP MspInit.
     - MspDeInitCallback : OPAMP MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
   - Use function HAL_OPAMP_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
     - MspInitCallback : OPAMP MspInit.
     - MspDeInitCallback : OPAMP MspDeInit.
     - All Callbacks
3. Configure the OPAMP using HAL_OPAMP_Init() function:
   - Select the mode
   - Select the inverting input
   - Select the non-inverting input
   - If PGA mode is enabled, Select if inverting input is connected.
   - Select either factory or user defined trimming mode.
   - If the user-defined trimming mode is enabled, select PMOS & NMOS trimming values (typically values set by HAL_OPAMP_SelfCalibrate function).
4. Enable the OPAMP using HAL_OPAMP_Start() function.
5. Disable the OPAMP using HAL_OPAMP_Stop() function.
6. Lock the OPAMP in running mode using HAL_OPAMP_Lock() function. Caution: On STM32H5, HAL OPAMP lock is software lock only (not hardware lock as on some other STM32 devices)
7. If needed, unlock the OPAMP using HAL_OPAMPEx_Unlock() function.

Running mode: change of configuration while OPAMP ON

To Re-configure OPAMP when OPAMP is ON (change on the fly)

1. If needed, fill in the HAL_OPAMP_MspInit()
   - This is the case for instance if you wish to use new OPAMP I/O
2. Configure the OPAMP using HAL_OPAMP_Init() function:
   - As in configure case, select first the parameters you wish to modify.
3. Change from high speed mode to normal power mode (& vice versa) requires first HAL_OPAMP_DeInit() (force OPAMP OFF) and then HAL_OPAMP_Init(). In other words, of OPAMP is ON, HAL_OPAMP_Init can NOT change power mode alone.

OPAMP pinout

Table 2. OPAMPs outputs for the STM32H5 devices: +---------- | | | OPAMP1 | |----------|--------|----------| | Output | VOUT | External : | | | PA7 | | | | | | | Internal : | | | | ADC1_INM3 | | | | ADC1_INP7 | |----------|--------|----------|

49.2.3 Initialization and de-initialization functions

This section contains the following APIs:

- *HAL_OPAMP_Init()*

- *HAL_OPAMP_DeInit()*
- *HAL_OPAMP_MspInit()*
- *HAL_OPAMP_MspDeInit()*

49.2.4 IO operation functions

This subsection provides a set of functions allowing to manage the OPAMP start, stop and calibration actions.

This section contains the following APIs:

- *HAL_OPAMP_Start()*
- *HAL_OPAMP_Stop()*
- *HAL_OPAMP_SelfCalibrate()*

49.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the OPAMP data transfers.

This section contains the following APIs:

- *HAL_OPAMP_Lock()*
- *HAL_OPAMP_GetTrimOffset()*
- *HAL_OPAMP_RegisterCallback()*
- *HAL_OPAMP_UnRegisterCallback()*

49.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_OPAMP_GetState()*

49.2.7 Detailed description of functions

HAL_OPAMP_Init

Function name

HAL_StatusTypeDef HAL_OPAMP_Init (OPAMP_HandleTypeDef * hopamp)

Function description

Initialize the OPAMP according to the specified parameters in the OPAMP_InitTypeDef and initialize the associated handle.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- If the selected opamp is locked, initialization can't be performed. To unlock the configuration, perform a system reset.

HAL_OPAMP_DeInit

Function name

HAL_StatusTypeDef HAL_OPAMP_DeInit (OPAMP_HandleTypeDef * hopamp)

Function description

DeInitialize the OPAMP peripheral.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- Deinitialization can be performed if the OPAMP configuration is locked. (the lock is SW in H7)

HAL_OPAMP_MspInit

Function name

void HAL_OPAMP_MspInit (OPAMP_HandleTypeDef * hopamp)

Function description

Initialize the OPAMP MSP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **None:**

HAL_OPAMP_MspDeInit

Function name

void HAL_OPAMP_MspDeInit (OPAMP_HandleTypeDef * hopamp)

Function description

DeInitialize OPAMP MSP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **None:**

HAL_OPAMP_Start

Function name

HAL_StatusTypeDef HAL_OPAMP_Start (OPAMP_HandleTypeDef * hopamp)

Function description

Start the OPAMP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

HAL_OPAMP_Stop

Function name

HAL_StatusTypeDef HAL_OPAMP_Stop (OPAMP_HandleTypeDef * hopamp)

Function description

Stop the OPAMP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

HAL_OPAMP_SelfCalibrate

Function name

HAL_StatusTypeDef HAL_OPAMP_SelfCalibrate (OPAMP_HandleTypeDef * hopamp)

Function description

Run the self calibration of one OPAMP.

Parameters

- **hopamp:** handle

Return values

- **Updated:** offset trimming values (PMOS & NMOS), user trimming is enabled
- **HAL:** status

Notes

- Calibration is performed in the mode specified in OPAMP init structure (mode normal or high-speed). To perform calibration for both modes, repeat this function twice after OPAMP init structure accordingly updated.

HAL_OPAMP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OPAMP_RegisterCallback (OPAMP_HandleTypeDef * hopamp, HAL_OPAMP_CallbackIDTypeDef CallbackId, pOPAMP_CallbackTypeDef pCallback)

Function description

Register a User OPAMP Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hopamp:** OPAMP handle
- **CallbackId:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OPAMP_MSPINIT_CB_ID OPAMP MspInit callback ID
  - HAL_OPAMP_MSPDEINIT_CB_ID OPAMP MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

Notes

- The HAL_OPAMP_RegisterCallback() may be called before HAL_OPAMP_Init() in HAL_OPAMP_STATE_RESET to register callbacks for HAL_OPAMP_MSPINIT_CB_ID and HAL_OPAMP_MSPDEINIT_CB_ID

HAL_OPAMP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OPAMP_UnRegisterCallback (OPAMP_HandleTypeDef * hopamp, HAL_OPAMP_CallbackIDTypeDef CallbackId)

Function description

Unregister a User OPAMP Callback OPAMP Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hopamp:** OPAMP handle
- **CallbackId:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_OPAMP_MSPINIT_CB_ID OPAMP MSP Init Callback ID
  - HAL_OPAMP_MSPDEINIT_CB_ID OPAMP MSP DeInit Callback ID
  - HAL_OPAMP_ALL_CB_ID OPAMP All Callbacks

Return values

- **status:**

Notes

- The HAL_OPAMP_UnRegisterCallback() may be called before HAL_OPAMP_Init() in HAL_OPAMP_STATE_RESET to un-register callbacks for HAL_OPAMP_MSPINIT_CB_ID and HAL_OPAMP_MSPDEINIT_CB_ID

HAL_OPAMP_Lock

Function name

HAL_StatusTypeDef HAL_OPAMP_Lock (OPAMP_HandleTypeDef * hopamp)

Function description

Lock the selected OPAMP configuration.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- On STM32H5, HAL OPAMP lock is software lock only (in contrast of hardware lock available on some other STM32 devices)

HAL_OPAMP_GetTrimOffset

Function name

HAL_OPAMP_TrimmingValueTypeDef HAL_OPAMP_GetTrimOffset (const OPAMP_HandleTypeDef * hopamp, uint32_t trimmingoffset)

Function description

Return the OPAMP factory trimming value.

Parameters

- **hopamp:** OPAMP handle
- **trimmingoffset:** Trimming offset (P or N) This parameter must be a value of OPAMP Factory Trimming

Return values

- **Trimming:** value (P or N): range: 0->31 or OPAMP_FACTORYTRIMMING_DUMMY if trimming value is not available

Notes

- On STM32H5 OPAMP, user can retrieve factory trimming if OPAMP has never been set to user trimming before. Therefore, this function must be called when OPAMP init parameter "UserTrimming" is set to trimming factory, and before OPAMP calibration (function "HAL_OPAMP_SelfCalibrate()"). Otherwise, factory trimming value cannot be retrieved and error status is returned.
- Calibration parameter retrieved is corresponding to the mode specified in OPAMP init structure (mode normal or high-speed). To retrieve calibration parameters for both modes, repeat this function after OPAMP init structure accordingly updated.

HAL_OPAMP_GetState

Function name

HAL_OPAMP_StateTypeDef HAL_OPAMP_GetState (const OPAMP_HandleTypeDef * hopamp)

Function description

Return the OPAMP handle state.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** state

49.3 OPAMP Firmware driver defines

The following section lists the various define and macros of the module.

49.3.1 OPAMP

OPAMP

OPAMP Exported Macros

__HAL_OPAMP_RESET_HANDLE_STATE

Description:

- Reset OPAMP handle state.

Parameters:

- __HANDLE__: OPAMP handle.

Return value:

- None

OPAMP Factory Trimming

OPAMP_FACTORYTRIMMING_DUMMY

Dummy value if trimming value could not be retrieved

OPAMP_FACTORYTRIMMING_N

Offset trimming N

OPAMP_FACTORYTRIMMING_P

Offset trimming P

OPAMP Inverting Input

OPAMP_INVERTINGINPUT_IO0

OPAMP inverting input connected to I/O VINM0 (PC5 for OPAMP1)

OPAMP_INVERTINGINPUT_IO1

OPAMP inverting input connected to I/0 VINM1 (PB1 for OPAMP1)

OPAMP_INVERTINGINPUT_CONNECT_NO

OPAMP inverting input not externally connected (intended for OPAMP in mode follower or PGA with positive gain without bias). Note: On this STM32 series, this literal include cases of value 0x11 for mode follower and value 0x10 for mode PGA.

OPAMP Mode

OPAMP_STANDALONE_MODE

standalone mode

OPAMP_PGA_MODE

PGA mode

OPAMP_FOLLOWER_MODE

follower mode

OPAMP Non Inverting Input

OPAMP_NONINVERTINGINPUT_IO0

OPAMP non inverting input connected to I/O VINP0 (PB0 for OPAMP1)

OPAMP_NONINVERTINGINPUT_IO1

OPAMP non inverting input connected to I/O VINP0 (PA0 for OPAMP1)

OPAMP_NONINVERTINGINPUT_DAC_CH

OPAMP non-inverting input connected internally to DAC channel

OPAMP Pga Connect

OPAMP_PGA_CONNECT_INVERTINGINPUT_NO

In PGA mode, the inverting input is not connected

OPAMP_PGA_CONNECT_INVERTINGINPUT_IO0

In PGA mode, the inverting input is connected to VINM0

OPAMP_PGA_CONNECT_INVERTINGINPUT_IO0_BIAS

In PGA mode, the inverting input is connected to VINM0 or bias

OPAMP_PGA_CONNECT_INVERTINGINPUT_IO0_IO1_BIAS

In PGA mode, the inverting input is connected to VINM0 or bias , VINM1 connected for filtering

OPAMP Pga Gain

OPAMP_PGA_GAIN_2_OR_MINUS_1

PGA gain could be 2 or -1

OPAMP_PGA_GAIN_4_OR_MINUS_3

PGA gain could be 4 or -3

OPAMP_PGA_GAIN_8_OR_MINUS_7

PGA gain could be 8 or -7

OPAMP_PGA_GAIN_16_OR_MINUS_15

PGA gain could be 16 or -15

OPAMP PowerMode

OPAMP_POWERMODE_NORMAL

OPAMP_POWERMODE_HIGHSPEED

OPAMP User Trimming

OPAMP_TRIMMING_FACTORY

Factory trimming

OPAMP_TRIMMING_USER

User trimming

OPAMP VREF

OPAMP_VREF_3VDDA

OPAMP Vref = 3.3% VDDA

OPAMP_VREF_10VDDA

OPAMP Vref = 10% VDDA

OPAMP_VREF_50VDDA

OPAMP Vref = 50% VDDA

OPAMP_VREF_90VDDA

OPAMP Vref = 90% VDDA

50 HAL OPAMP Extension Driver

50.1 OPAMPEx Firmware driver API description

The following section lists the various functions of the OPAMPEx library.

50.1.1 Peripheral Control functions

- OPAMP unlock.

50.1.2 Detailed description of functions

HAL_OPAMPEx_Unlock

Function name

HAL_StatusTypeDef HAL_OPAMPEx_Unlock (OPAMP_HandleTypeDef * hopamp)

Function description

Unlock the selected OPAMP configuration.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- This function must be called only when OPAMP is in state "locked".

51 HAL OTFDEC Generic Driver

51.1 OTFDEC Firmware driver registers structures

51.1.1 OTFDEC_RegionConfigTypeDef

OTFDEC_RegionConfigTypeDef is defined in the stm32h5xx_hal_otfdec.h

Data Fields

- ***uint32_t Nonce***
- ***uint32_t StartAddress***
- ***uint32_t EndAddress***
- ***uint16_t Version***

Field Documentation

- ***uint32_t OTFDEC_RegionConfigTypeDef::Nonce[2]***
  OTFDEC region nonce
- ***uint32_t OTFDEC_RegionConfigTypeDef::StartAddress***
  OTFDEC region start address
- ***uint32_t OTFDEC_RegionConfigTypeDef::EndAddress***
  OTFDEC region end address
- ***uint16_t OTFDEC_RegionConfigTypeDef::Version***
  OTFDEC region firmware version

51.1.2 __OTFDEC_HandleTypeDef

__OTFDEC_HandleTypeDef is defined in the stm32h5xx_hal_otfdec.h

Data Fields

- ***OTFDEC_TypeDef * Instance***
- ***HAL_OTFDEC_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***void(* ErrorCallback***

- ***void(* MspDeInitCallback***

Field Documentation

- ***OTFDEC_TypeDef* __OTFDEC_HandleTypeDef::Instance***
  OTFDEC registers base address
- ***HAL_OTFDEC_StateTypeDef __OTFDEC_HandleTypeDef::State***
  OTFDEC state
- ***HAL_LockTypeDef __OTFDEC_HandleTypeDef::Lock***
  OTFDEC locking object
- ***__IO uint32_t __OTFDEC_HandleTypeDef::ErrorCode***
  OTFDEC error code
- ***void(* __OTFDEC_HandleTypeDef::ErrorCallback)(struct __OTFDEC_HandleTypeDef *hotfdec)***
  OTFDEC error callback
- ***void(* __OTFDEC_HandleTypeDef::MspInitCallback)(struct __OTFDEC_HandleTypeDef *hotfdec)***
  OTFDEC Msp Init callback
- ***void(* __OTFDEC_HandleTypeDef::MspDeInitCallback)(struct __OTFDEC_HandleTypeDef *hotfdec)***
  OTFDEC Msp DeInit callback

51.2 OTFDEC Firmware driver API description

The following section lists the various functions of the OTFDEC library.

51.2.1 How to use this driver

The OTFDEC HAL driver can be used as follows:

1. Declare an OTFDEC_HandleTypeDef handle structure (eg. OTFDEC_HandleTypeDef hotfdec).
2. Initialize the OTFDEC low level resources by implementing the HAL_OTFDEC_MspInit() API:
   - Enable the OTFDEC interface clock.
   - NVIC configuration if interrupts are used
     - Configure the OTFDEC interrupt priority.
     - Enable the NVIC OTFDEC IRQ handle.
3. Initialize the OTFDEC peripheral by calling the HAL_OTFDEC_Init() API.
4. In the case of encryption, enable ciphering mode for the peripheral
5. For each region,
   - Configure the region deciphering mode by calling the HAL_OTFDEC_RegionSetMode() API.
   - Write the region Key by calling the HAL_OTFDEC_RegionSetKey() API. If desired, read the key CRC by calling HAL_OTFDEC_RegionGetKeyCRC() API and compare the result with the theoretically expected CRC.
   - Initialize the OTFDEC region config structure with the Nonce, protected region start and end addresses and firmware version, and wrap-up the region configuration by calling HAL_OTFDEC_RegionConfig() API.
6. At this point, the OTFDEC region configuration is done and the deciphering or enciphering enabled. The region can be deciphered on the fly after having made sure the OctoSPI is configured in memory-mapped mode or data can be enciphered by calling HAL_OTFDEC_Cipher() API.

Note: Warning: the OTFDEC en/deciphering is based on a different endianness compared to the AES-CTR as implemented in the AES peripheral. E.g., if the OTFEC resorts to the Key (B0, B1, B2, B3) where Bi are 32-bit longwords and B0 is the Least Significant Word, the AES has to be configured with the Key (B3, B2, B1, B0) to report the same result (with the same swapping applied to the Initialization Vector).

Callback registration

The compilation flag USE_HAL_OTFDEC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_OTFDEC_RegisterCallback() to register an interrupt callback.

Function @ref HAL_OTFDEC_RegisterCallback() allows to register following callbacks:

- ErrorCallback : OTFDEC error callback
- MspInitCallback : OTFDEC Msp Init callback
- MspDeInitCallback : OTFDEC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_OTFDEC_UnRegisterCallback to reset a callback to the default weak function.

@ref HAL_OTFDEC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : OTFDEC error callback
- MspInitCallback : OTFDEC Msp Init callback
- MspDeInitCallback : OTFDEC Msp DeInit callback

By default, after the @ref HAL_OTFDEC_Init() and when the state is @ref HAL_OTFDEC_STATE_RESET all callbacks are set to the corresponding weak functions: example @ref HAL_OTFDEC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the @ref HAL_OTFDEC_Init()/ @ref HAL_OTFDEC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the @ref HAL_OTFDEC_Init()/ @ref HAL_OTFDEC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in @ref HAL_OTFDEC_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in @ref HAL_OTFDEC_STATE_READY or @ref HAL_OTFDEC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using @ref HAL_OTFDEC_RegisterCallback() before calling @ref HAL_OTFDEC_DeInit() or @ref HAL_OTFDEC_Init() function.

When the compilation flag USE_HAL_OTFDEC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

51.2.2 Initialization and de-initialization functions

This section contains the following APIs:

- *HAL_OTFDEC_Init()*
- *HAL_OTFDEC_DeInit()*
- *HAL_OTFDEC_MspInit()*
- *HAL_OTFDEC_MspDeInit()*
- *HAL_OTFDEC_RegisterCallback()*
- *HAL_OTFDEC_UnRegisterCallback()*

51.2.3 OTFDEC IRQ handler management

This section provides OTFDEC IRQ handler function.

This section contains the following APIs:

- *HAL_OTFDEC_IRQHandler()*
- *HAL_OTFDEC_ErrorCallback()*

51.2.4 Peripheral Control functions

This subsection permits to configure the OTFDEC peripheral

This section contains the following APIs:

- *HAL_OTFDEC_RegionKeyLock()*
- *HAL_OTFDEC_RegionSetKey()*
- *HAL_OTFDEC_RegionSetMode()*
- *HAL_OTFDEC_RegionConfig()*
- *HAL_OTFDEC_ConfigAttributes()*
- *HAL_OTFDEC_KeyCRCComputation()*
- *HAL_OTFDEC_EnableEnciphering()*
- *HAL_OTFDEC_DisableEnciphering()*
- *HAL_OTFDEC_Cipher()*
- *HAL_OTFDEC_RegionEnable()*
- *HAL_OTFDEC_RegionDisable()*

51.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_OTFDEC_GetState()*
- *HAL_OTFDEC_GetConfigAttributes()*
- *HAL_OTFDEC_RegionGetKeyCRC()*
- *HAL_OTFDEC_RegionGetConfig()*

51.2.6 Detailed description of functions

HAL_OTFDEC_Init

Function name

HAL_StatusTypeDef HAL_OTFDEC_Init (OTFDEC_HandleTypeDef * hotfdec)

Function description

Initialize the OTFDEC peripheral and create the associated handle.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** status

HAL_OTFDEC_DeInit

Function name

HAL_StatusTypeDef HAL_OTFDEC_DeInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

DeInitialize the OTFDEC peripheral.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** status

HAL_OTFDEC_MspInit

Function name

void HAL_OTFDEC_MspInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

Initialize the OTFDEC MSP.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_MspDeInit

Function name

void HAL_OTFDEC_MspDeInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

DeInitialize OTFDEC MSP.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegisterCallback (OTFDEC_HandleTypeDef * hotfdec, HAL_OTFDEC_CallbackIDTypeDef CallbackID, pOTFDEC_CallbackTypeDef pCallback)

Function description

Register a User OTFDEC Callback To be used instead of the weak predefined callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OTFDEC_ERROR_CB_ID OTFDEC error callback ID
  - HAL_OTFDEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_OTFDEC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_OTFDEC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OTFDEC_UnRegisterCallback (OTFDEC_HandleTypeDef * hotfdec, HAL_OTFDEC_CallbackIDTypeDef CallbackID)

Function description

Unregister a OTFDEC Callback OTFDEC callback is redirected to the weak predefined callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_OTFDEC_ERROR_CB_ID OTFDEC error callback ID
  - HAL_OTFDEC_MSPINIT_CB_ID MspInit callback ID
  - HAL_OTFDEC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_OTFDEC_IRQHandler

Function name

void HAL_OTFDEC_IRQHandler (OTFDEC_HandleTypeDef * hotfdec)

Function description

Handle OTFDEC interrupt request.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_ErrorCallback

Function name

void HAL_OTFDEC_ErrorCallback (OTFDEC_HandleTypeDef * hotfdec)

Function description

OTFDEC error callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_RegionKeyLock

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionKeyLock (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Lock region keys.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys of which are locked

Return values

- **HAL:** state

Notes

- Writes to this region KEYRx registers are ignored until next OTFDEC reset.

HAL_OTFDEC_RegionSetKey

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionSetKey (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, uint32_t * pKey)

Function description

Set region keys.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys of which are set
- **pKey:** pointer at set of keys

Return values

- **HAL:** state

Notes

- The API reads the key CRC computed by the peripheral and compares it with that theoretically expected. An error is reported if they are different.

HAL_OTFDEC_RegionSetMode

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionSetMode (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, uint32_t mode)

Function description

Set region mode.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the mode of which is set
- **mode:** This parameter can be only:
  - OTFDEC_REG_MODE_INSTRUCTION_OR_DATA_ACCESSES All read accesses are decrypted (instruction or data)
  - OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY_WITH_CIPHER Only instruction accesses are decrypted with proprietary cipher activated

Return values

- **HAL:** state

HAL_OTFDEC_RegionConfig

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionConfig (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, const OTFDEC_RegionConfigTypeDef * Config, uint32_t lock)

Function description

Set region configuration.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region that is configured
- **Config:** pointer on structure containing the region configuration parameters
- **lock:** configuration lock enable or disable parameter This parameter can be one of the following values:
  - OTFDEC_REG_CONFIGR_LOCK_DISABLE OTFDEC region configuration is not locked
  - OTFDEC_REG_CONFIGR_LOCK_ENABLE OTFDEC region configuration is locked

Return values

- **HAL:** state

Notes

- Region enciphering/deciphering is enabled at the end of this function

HAL_OTFDEC_KeyCRCComputation

Function name

uint32_t HAL_OTFDEC_KeyCRCComputation (const uint32_t * pKey)

Function description

Compute Key CRC.

Parameters

- **pKey:** pointer at set of keys

Return values

- **CRC:** value

HAL_OTFDEC_RegionEnable

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionEnable (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Enable region processing (enciphering or deciphering).

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the enciphering or deciphering is enabled

Return values

- **HAL:** state

Notes

- An error is reported when the configuration is locked.

HAL_OTFDEC_RegionDisable

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionDisable (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Disable region processing (enciphering or deciphering).

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the enciphering or deciphering is disabled

Return values

- **HAL:** state

Notes

- An error is reported when the configuration is locked.

HAL_OTFDEC_ConfigAttributes

Function name

HAL_StatusTypeDef HAL_OTFDEC_ConfigAttributes (OTFDEC_HandleTypeDef * hotfdec, uint32_t Attributes)

Function description

Configure OTFDEC attributes.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **Attributes:** This parameter can be only:
  - OTFDEC_ATTRIBUTE_PRIV Set privileged access protection
  - OTFDEC_ATTRIBUTE_NPRIV Reset privileged access protection

Return values

- **HAL:** state

Notes

- This function sets or resets regions privileged access protection.

HAL_OTFDEC_EnableEnciphering

Function name

HAL_StatusTypeDef HAL_OTFDEC_EnableEnciphering (OTFDEC_HandleTypeDef * hotfdec)

Function description

Enable peripheral enciphering.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

Notes

- By default, deciphering mode is enabled at reset

HAL_OTFDEC_DisableEnciphering

Function name

HAL_StatusTypeDef HAL_OTFDEC_DisableEnciphering (OTFDEC_HandleTypeDef * hotfdec)

Function description

Disable peripheral enciphering.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

HAL_OTFDEC_Cipher

Function name

HAL_StatusTypeDef HAL_OTFDEC_Cipher (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, const uint32_t * input, uint32_t * output, uint32_t size, uint32_t start_address)

Function description

Cipher data.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the configuration of which is used to encipher
- **input:** plain data
- **output:** ciphered data
- **size:** plain data size in words
- **start_address:** starting address in the external memory area where the enciphered data will be eventually stored

Return values

- **HAL:** state

Notes

- Region configuration parameters and OTFDEC_CR ENC bit must be set.
- output pointer points at a temporary area in RAM to store the ciphered data. It is up to the user code to copy the ciphered data in external RAM once the enciphering process is over.

HAL_OTFDEC_GetState

Function name

HAL_OTFDEC_StateTypeDef HAL_OTFDEC_GetState (const OTFDEC_HandleTypeDef * hotfdec)

Function description

Return the OTFDEC state.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

HAL_OTFDEC_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_OTFDEC_GetConfigAttributes (OTFDEC_HandleTypeDef * hotfdec, uint32_t * Attributes)

Function description

Get OTFDEC configuration attributes.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **Attributes:** pointer to attributes variable. This parameter can be only:
  - OTFDEC_ATTRIBUTE_PRIV Set privileged access protection
  - OTFDEC_ATTRIBUTE_NPRIV Reset privileged access protection

Return values

- **HAL:** state

Notes

- This function returns whether or not the regions access protection is in privileged mode.

HAL_OTFDEC_RegionGetKeyCRC

Function name

uint32_t HAL_OTFDEC_RegionGetKeyCRC (const OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Return region keys CRC.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys CRC of which is read

Return values

- **Key:** CRC

HAL_OTFDEC_RegionGetConfig

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionGetConfig (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, OTFDEC_RegionConfigTypeDef * Config)

Function description

Return region configuration parameters.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the configuration of which is read
- **Config:** pointer on structure that will be filled up with the region configuration parameters

Return values

- **HAL:** state

51.3 OTFDEC Firmware driver defines

The following section lists the various define and macros of the module.

51.3.1 OTFDEC

OTFDEC

OTFDEC Configuration Attributes

OTFDEC_ATTRIBUTE_NPRIV

Non-privileged access protection

OTFDEC_ATTRIBUTE_PRIV

Privileged access protection

OTFDEC Error Definition

HAL_OTFDEC_ERROR_NONE

No error

HAL_OTFDEC_SECURITY_ERROR

Security error

HAL_OTFDEC_EXECUTE_ERROR

Execute-only Execute-Never error

HAL_OTFDEC_KEY_ERROR

Key error

HAL_OTFDEC_ERROR_INVALID_CALLBACK

Invalid Callback error

OTFDEC Exported Macros

__HAL_OTFDEC_RESET_HANDLE_STATE

Description:

- Reset OTFDEC handle state.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return value:

- None

__HAL_OTFDEC_ENABLE_IT

Description:

- Enable OTFDEC peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __INTERRUPT__: mask on enabled interrupts This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts
  - OTFDEC_ALL_INT OTFDEC all interrupts

Return value:

- None

__HAL_OTFDEC_DISABLE_IT

Description:

- Disable OTFDEC peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __INTERRUPT__: mask on disabled interrupts This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts
  - OTFDEC_ALL_INT OTFDEC all interrupts

Return value:

- None

__HAL_OTFDEC_GET_FLAG

Description:

- Check whether the specified combination of OTFDEC interrupt flags is set or not.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __FLAG__: mask on combination of interrupts flags This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt flag
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt flag
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt flag
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts flags
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts flags
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts flag
  - OTFDEC_ALL_INT OTFDEC all interrupts flags

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_OTFDEC_CLEAR_FLAG

Description:

- Clear the specified combination of OTFDEC interrupt flags.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __FLAG__: mask on combination of interrupts flags This parameter can be one of the following values:
  - OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt flag
  - OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt flag
  - OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt flag
  - OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts flags
  - OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts flags
  - OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts flag
  - OTFDEC_ALL_INT OTFDEC all interrupts flags

Return value:

- None

OTFDEC Interrupts

OTFDEC_SEC_ERROR_INT

OTFDEC security error interrupt

OTFDEC_EXE_ERROR_INT

OTFDEC execution error interrupt

OTFDEC_KEY_ERROR_INT

OTFDEC key error interrupt

OTFDEC_SEC_EXE_ERROR_INT

OTFDEC security and execution errors interrupts

OTFDEC_SEC_KEY_ERROR_INT

OTFDEC security and key errors interrupts

OTFDEC_EXE_KEY_ERROR_INT

OTFDEC execution and key errors interrupts

OTFDEC_ALL_INT

OTFDEC all interrupts

OTFDEC Regions Index

OTFDEC_REGION1

OTFDEC region 1

OTFDEC_REGION2

OTFDEC region 2

OTFDEC_REGION3

OTFDEC region 3

OTFDEC_REGION4

OTFDEC region 4

OTFDEC Region Configuration Lock

OTFDEC_REG_CONFIGR_LOCK_DISABLE

OTFDEC region configuration lock disable

OTFDEC_REG_CONFIGR_LOCK_ENABLE

OTFDEC region configuration lock enable

OTFDEC Region Enable

OTFDEC_REG_CONFIGR_REG_DISABLE

OTFDEC region encryption or on-the-fly decryption disable

OTFDEC_REG_CONFIGR_REG_ENABLE

OTFDEC region encryption or on-the-fly decryption enable

OTFDEC Region Operating Mode

OTFDEC_REG_MODE_INSTRUCTION_OR_DATA_ACCESSES

All read accesses are decrypted

OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY_WITH_CIPHER

Only instruction accesses are decrypted with proprietary cipher activated

52 HAL PCD Generic Driver

52.1 PCD Firmware driver registers structures

52.1.1 __PCD_HandleTypeDef

__PCD_HandleTypeDef is defined in the stm32h5xx_hal_pcd.h

52.2 PCD Firmware driver API description

The following section lists the various functions of the PCD library.

52.2.1 How to use this driver

The PCD HAL driver can be used as follows:

1. Declare a PCD_HandleTypeDef handle structure, for example: PCD_HandleTypeDef hpcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_PCD_Init() API to initialize the PCD peripheral (Core, Device core, ...)
4. Initialize the PCD low level resources through the HAL_PCD_MspInit() API:
   a. Enable the PCD/USB Low Level interface clock using
      ◦ __HAL_RCC_USB_CLK_ENABLE(); For USB Device FS peripheral
   b. Initialize the related GPIO clocks
   c. Configure PCD pin-out
   d. Configure PCD NVIC interrupt
5. Associate the Upper USB device stack to the HAL PCD Driver:
   a. hpcd.pData = pdev;
6. Enable PCD transmission and reception:
   a. HAL_PCD_Start();

52.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

This section contains the following APIs:

- ***HAL_PCD_Init()***
- ***HAL_PCD_DeInit()***
- ***HAL_PCD_MspInit()***
- ***HAL_PCD_MspDeInit()***
- ***HAL_PCD_RegisterCallback()***
- ***HAL_PCD_UnRegisterCallback()***
- ***HAL_PCD_RegisterDataOutStageCallback()***
- ***HAL_PCD_UnRegisterDataOutStageCallback()***
- ***HAL_PCD_RegisterDataInStageCallback()***
- ***HAL_PCD_UnRegisterDataInStageCallback()***
- ***HAL_PCD_RegisterIsoOutIncpltCallback()***
- ***HAL_PCD_UnRegisterIsoOutIncpltCallback()***
- ***HAL_PCD_RegisterIsoInIncpltCallback()***
- ***HAL_PCD_UnRegisterIsoInIncpltCallback()***
- ***HAL_PCD_RegisterBcdCallback()***
- ***HAL_PCD_UnRegisterBcdCallback()***
- ***HAL_PCD_RegisterLpmCallback()***
- ***HAL_PCD_UnRegisterLpmCallback()***

52.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PCD data transfers.

This section contains the following APIs:

- ***HAL_PCD_Start()***
- ***HAL_PCD_Stop()***
- ***HAL_PCD_IRQHandler()***
- ***HAL_PCD_DataOutStageCallback()***
- ***HAL_PCD_DataInStageCallback()***
- ***HAL_PCD_SetupStageCallback()***
- ***HAL_PCD_SOFCallback()***
- ***HAL_PCD_ResetCallback()***

- *HAL_PCD_SuspendCallback()*
- *HAL_PCD_ResumeCallback()*
- *HAL_PCD_ISOOUTIncompleteCallback()*
- *HAL_PCD_ISOINIncompleteCallback()*
- *HAL_PCD_ConnectCallback()*
- *HAL_PCD_DisconnectCallback()*

52.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the PCD data transfers.

This section contains the following APIs:

- *HAL_PCD_DevConnect()*
- *HAL_PCD_DevDisconnect()*
- *HAL_PCD_SetAddress()*
- *HAL_PCD_EP_Open()*
- *HAL_PCD_EP_Close()*
- *HAL_PCD_EP_Receive()*
- *HAL_PCD_EP_GetRxCount()*
- *HAL_PCD_EP_Transmit()*
- *HAL_PCD_EP_SetStall()*
- *HAL_PCD_EP_ClrStall()*
- *HAL_PCD_EP_Abort()*
- *HAL_PCD_EP_Flush()*
- *HAL_PCD_ActivateRemoteWakeup()*
- *HAL_PCD_DeActivateRemoteWakeup()*

52.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_PCD_GetState()*

52.2.6 Detailed description of functions

HAL_PCD_Init

Function name

HAL_StatusTypeDef HAL_PCD_Init (PCD_HandleTypeDef * hpcd)

Function description

Initializes the PCD according to the specified parameters in the PCD_InitTypeDef and initialize the associated handle.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DeInit

Function name

HAL_StatusTypeDef HAL_PCD_DeInit (PCD_HandleTypeDef * hpcd)

Function description

DeInitializes the PCD peripheral.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_MspInit

Function name

void HAL_PCD_MspInit (PCD_HandleTypeDef * hpcd)

Function description

Initializes the PCD MSP.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_MspDeInit

Function name

void HAL_PCD_MspDeInit (PCD_HandleTypeDef * hpcd)

Function description

DeInitializes PCD MSP.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_RegisterCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterCallback (PCD_HandleTypeDef * hpcd, HAL_PCD_CallbackIDTypeDef CallbackID, pPCD_CallbackTypeDef pCallback)

Function description

Register a User USB PCD Callback To be used instead of the weak predefined callback.

Parameters

- **hpcd:** USB PCD handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_PCD_SOF_CB_ID USB PCD SOF callback ID
  - HAL_PCD_SETUPSTAGE_CB_ID USB PCD Setup callback ID
  - HAL_PCD_RESET_CB_ID USB PCD Reset callback ID
  - HAL_PCD_SUSPEND_CB_ID USB PCD Suspend callback ID
  - HAL_PCD_RESUME_CB_ID USB PCD Resume callback ID
  - HAL_PCD_CONNECT_CB_ID USB PCD Connect callback ID
  - HAL_PCD_DISCONNECT_CB_ID USB PCD Disconnect callback ID
  - HAL_PCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_PCD_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterCallback (PCD_HandleTypeDef * hpcd, HAL_PCD_CallbackIDTypeDef CallbackID)

Function description

Unregister an USB PCD Callback USB PCD callback is redirected to the weak predefined callback.

Parameters

- **hpcd:** USB PCD handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_PCD_SOF_CB_ID USB PCD SOF callback ID
  - HAL_PCD_SETUPSTAGE_CB_ID USB PCD Setup callback ID
  - HAL_PCD_RESET_CB_ID USB PCD Reset callback ID
  - HAL_PCD_SUSPEND_CB_ID USB PCD Suspend callback ID
  - HAL_PCD_RESUME_CB_ID USB PCD Resume callback ID
  - HAL_PCD_CONNECT_CB_ID USB PCD Connect callback ID
  - HAL_PCD_DISCONNECT_CB_ID USB PCD Disconnect callback ID
  - HAL_PCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_PCD_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_PCD_RegisterDataOutStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterDataOutStageCallback (PCD_HandleTypeDef * hpcd, pPCD_DataOutStageCallbackTypeDef pCallback)

Function description

Register USB PCD Data OUT Stage Callback To be used instead of the weak HAL_PCD_DataOutStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Data OUT Stage Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterDataOutStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterDataOutStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Data OUT Stage Callback USB PCD Data OUT Stage Callback is redirected to the weak HAL_PCD_DataOutStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterDataInStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterDataInStageCallback (PCD_HandleTypeDef * hpcd, pPCD_DataInStageCallbackTypeDef pCallback)

Function description

Register USB PCD Data IN Stage Callback To be used instead of the weak HAL_PCD_DataInStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Data IN Stage Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterDataInStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterDataInStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Data IN Stage Callback USB PCD Data OUT Stage Callback is redirected to the weak HAL_PCD_DataInStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterIsoOutIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterIsoOutIncpltCallback (PCD_HandleTypeDef * hpcd, pPCD_IsoOutIncpltCallbackTypeDef pCallback)

Function description

Register USB PCD Iso OUT incomplete Callback To be used instead of the weak HAL_PCD_ISOOUTIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Iso OUT incomplete Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterIsoOutIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterIsoOutIncpltCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Iso OUT incomplete Callback USB PCD Iso OUT incomplete Callback is redirected to the weak HAL_PCD_ISOOUTIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterIsoInIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterIsoInIncpltCallback (PCD_HandleTypeDef * hpcd, pPCD_IsoInIncpltCallbackTypeDef pCallback)

Function description

Register USB PCD Iso IN incomplete Callback To be used instead of the weak HAL_PCD_ISOINIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Iso IN incomplete Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterIsoInIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterIsoInIncpltCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Iso IN incomplete Callback USB PCD Iso IN incomplete Callback is redirected to the weak HAL_PCD_ISOINIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterBcdCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterBcdCallback (PCD_HandleTypeDef * hpcd, pPCD_BcdCallbackTypeDef pCallback)

Function description

Register USB PCD BCD Callback To be used instead of the weak HAL_PCDEx_BCD_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD BCD Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterBcdCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterBcdCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD BCD Callback USB BCD Callback is redirected to the weak HAL_PCDEx_BCD_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterLpmCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterLpmCallback (PCD_HandleTypeDef * hpcd, pPCD_LpmCallbackTypeDef pCallback)

Function description

Register USB PCD LPM Callback To be used instead of the weak HAL_PCDEx_LPM_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD LPM Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterLpmCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterLpmCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD LPM Callback USB LPM Callback is redirected to the weak HAL_PCDEx_LPM_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_Start

Function name

HAL_StatusTypeDef HAL_PCD_Start (PCD_HandleTypeDef * hpcd)

Function description

Start the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_Stop

Function name

HAL_StatusTypeDef HAL_PCD_Stop (PCD_HandleTypeDef * hpcd)

Function description

Stop the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_IRQHandler

Function name

void HAL_PCD_IRQHandler (PCD_HandleTypeDef * hpcd)

Function description

This function handles PCD interrupt request.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SOFCallback

Function name

void HAL_PCD_SOFCallback (PCD_HandleTypeDef * hpcd)

Function description

USB Start Of Frame callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_SetupStageCallback

Function name

void HAL_PCD_SetupStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Setup stage callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ResetCallback

Function name

void HAL_PCD_ResetCallback (PCD_HandleTypeDef * hpcd)

Function description

USB Reset callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_SuspendCallback

Function name

void HAL_PCD_SuspendCallback (PCD_HandleTypeDef * hpcd)

Function description

Suspend event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ResumeCallback

Function name

void HAL_PCD_ResumeCallback (PCD_HandleTypeDef * hpcd)

Function description

Resume event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ConnectCallback

Function name

void HAL_PCD_ConnectCallback (PCD_HandleTypeDef * hpcd)

Function description

Connection event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_DisconnectCallback

Function name

void HAL_PCD_DisconnectCallback (PCD_HandleTypeDef * hpcd)

Function description

Disconnection event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_DataOutStageCallback

Function name

void HAL_PCD_DataOutStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Data OUT stage callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_DataInStageCallback

Function name

void HAL_PCD_DataInStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Data IN stage callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_ISOOUTIncompleteCallback

Function name

void HAL_PCD_ISOOUTIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Incomplete ISO OUT callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_ISOINIncompleteCallback

Function name

void HAL_PCD_ISOINIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Incomplete ISO IN callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_DevConnect

Function name

HAL_StatusTypeDef HAL_PCD_DevConnect (PCD_HandleTypeDef * hpcd)

Function description

Connect the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DevDisconnect

Function name

HAL_StatusTypeDef HAL_PCD_DevDisconnect (PCD_HandleTypeDef * hpcd)

Function description

Disconnect the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SetAddress

Function name

HAL_StatusTypeDef HAL_PCD_SetAddress (PCD_HandleTypeDef * hpcd, uint8_t address)

Function description

Set the USB Device address.

Parameters

- **hpcd:** PCD handle
- **address:** new device address

Return values

- **HAL:** status

HAL_PCD_EP_Open

Function name

HAL_StatusTypeDef HAL_PCD_EP_Open (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint16_t ep_mps, uint8_t ep_type)

Function description

Open and configure an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **ep_mps:** endpoint max packet size
- **ep_type:** endpoint type

Return values

- **HAL:** status

HAL_PCD_EP_Close

Function name

HAL_StatusTypeDef HAL_PCD_EP_Close (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Deactivate an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Receive

Function name

HAL_StatusTypeDef HAL_PCD_EP_Receive (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint8_t * pBuf, uint32_t len)

Function description

Receive an amount of data.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **pBuf:** pointer to the reception buffer
- **len:** amount of data to be received

Return values

- **HAL:** status

HAL_PCD_EP_Transmit

Function name

HAL_StatusTypeDef HAL_PCD_EP_Transmit (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint8_t * pBuf, uint32_t len)

Function description

Send an amount of data.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **pBuf:** pointer to the transmission buffer
- **len:** amount of data to be sent

Return values

- **HAL:** status

HAL_PCD_EP_SetStall

Function name

HAL_StatusTypeDef HAL_PCD_EP_SetStall (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Set a STALL condition over an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_ClrStall

Function name

HAL_StatusTypeDef HAL_PCD_EP_ClrStall (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Clear a STALL condition over in an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Flush

Function name

HAL_StatusTypeDef HAL_PCD_EP_Flush (PCD_HandleTypeDef const * hpcd, uint8_t ep_addr)

Function description

Flush an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Abort

Function name

HAL_StatusTypeDef HAL_PCD_EP_Abort (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Abort an USB EP transaction.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_ActivateRemoteWakeup

Function name

HAL_StatusTypeDef HAL_PCD_ActivateRemoteWakeup (PCD_HandleTypeDef * hpcd)

Function description

Activate remote wakeup signalling.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DeActivateRemoteWakeup

Function name

HAL_StatusTypeDef HAL_PCD_DeActivateRemoteWakeup (PCD_HandleTypeDef * hpcd)

Function description

De-activate remote wakeup signalling.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_EP_GetRxCount

Function name

uint32_t HAL_PCD_EP_GetRxCount (PCD_HandleTypeDef const * hpcd, uint8_t ep_addr)

Function description

Get Received Data Size.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **Data:** Size

HAL_PCD_GetState

Function name

PCD_StateTypeDef HAL_PCD_GetState (PCD_HandleTypeDef const * hpcd)

Function description

Return the PCD handle state.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** state

PCD_GET_EP_RX_CNT

Function name

__STATIC_INLINE uint16_t PCD_GET_EP_RX_CNT (const PCD_TypeDef * Instance, uint16_t bEpNum)

Function description

gets counter of the rx buffer.

Parameters

- **Instance:** USB peripheral instance register address.
- **bEpNum:** channel Number.

Return values

- **Counter:** value

PCD_GET_EP_DBUF0_CNT

Function name

__STATIC_INLINE uint16_t PCD_GET_EP_DBUF0_CNT (const PCD_TypeDef * Instance, uint16_t bEpNum)

Function description

gets counter of the rx buffer0.

Parameters

- **Instance:** USB peripheral instance register address.
- **bEpNum:** channel Number.

Return values

- **Counter:** value

PCD_GET_EP_DBUF1_CNT

Function name

__STATIC_INLINE uint16_t PCD_GET_EP_DBUF1_CNT (const PCD_TypeDef * Instance, uint16_t bEpNum)

Function description

gets counter of the rx buffer1.

Parameters

- **Instance:** USB peripheral instance register address.
- **bEpNum:** channel Number.

Return values

- **Counter:** value

52.3 PCD Firmware driver defines

The following section lists the various define and macros of the module.

53 HAL PCD Extension Driver

53.1 PCDEx Firmware driver API description

The following section lists the various functions of the PCDEx library.

53.1.1 Extended features functions

This section provides functions allowing to:

- Update FIFO configuration

This section contains the following APIs:

- *HAL_PCDEx_PMAConfig()*
- *HAL_PCDEx_ActivateBCD()*
- *HAL_PCDEx_DeActivateBCD()*
- *HAL_PCDEx_BCD_VBUSDetect()*
- *HAL_PCDEx_ActivateLPM()*
- *HAL_PCDEx_DeActivateLPM()*
- *HAL_PCDEx_LPM_Callback()*
- *HAL_PCDEx_BCD_Callback()*

53.1.2 Detailed description of functions

HAL_PCDEx_PMAConfig

Function name

HAL_StatusTypeDef HAL_PCDEx_PMAConfig (PCD_HandleTypeDef * hpcd, uint16_t ep_addr, uint16_t ep_kind, uint32_t pmaadress)

Function description

Configure PMA for EP.

Parameters

- **hpcd:** Device instance
- **ep_addr:** endpoint address
- **ep_kind:** endpoint Kind USB_SNG_BUF: Single Buffer used USB_DBL_BUF: Double Buffer used
- **pmaadress:** EP address in The PMA: In case of single buffer endpoint this parameter is 16-bit value providing the address in PMA allocated to endpoint. In case of double buffer endpoint this parameter is a 32-bit value providing the endpoint buffer 0 address in the LSB part of 32-bit value and endpoint buffer 1 address in the MSB part of 32-bit value.

Return values

- **HAL:** status

HAL_PCDEx_ActivateLPM

Function name

HAL_StatusTypeDef HAL_PCDEx_ActivateLPM (PCD_HandleTypeDef * hpcd)

Function description

Activate LPM feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_DeActivateLPM

Function name

HAL_StatusTypeDef HAL_PCDEx_DeActivateLPM (PCD_HandleTypeDef * hpcd)

Function description

Deactivate LPM feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_ActivateBCD

Function name

HAL_StatusTypeDef HAL_PCDEx_ActivateBCD (PCD_HandleTypeDef * hpcd)

Function description

Activate BatteryCharging feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_DeActivateBCD

Function name

HAL_StatusTypeDef HAL_PCDEx_DeActivateBCD (PCD_HandleTypeDef * hpcd)

Function description

Deactivate BatteryCharging feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_BCD_VBUSDetect

Function name

void HAL_PCDEx_BCD_VBUSDetect (PCD_HandleTypeDef * hpcd)

Function description

Handle BatteryCharging Process.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_LPM_Callback

Function name

void HAL_PCDEx_LPM_Callback (PCD_HandleTypeDef * hpcd, PCD_LPM_MsgTypeDef msg)

Function description

Send LPM message to user layer callback.

Parameters

- **hpcd:** PCD handle
- **msg:** LPM message

Return values

- **HAL:** status

HAL_PCDEx_BCD_Callback

Function name

void HAL_PCDEx_BCD_Callback (PCD_HandleTypeDef * hpcd, PCD_BCD_MsgTypeDef msg)

Function description

Send BatteryCharging message to user layer callback.

Parameters

- **hpcd:** PCD handle
- **msg:** LPM message

Return values

- **HAL:** status

54 HAL PKA Generic Driver

54.1 PKA Firmware driver registers structures

54.1.1 __PKA_HandleTypeDef

__PKA_HandleTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***PKA_TypeDef * Instance***
- ***__IO HAL_PKA_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* OperationCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***PKA_TypeDef* __PKA_HandleTypeDef::Instance***
  Register base address
- ***__IO HAL_PKA_StateTypeDef __PKA_HandleTypeDef::State***
  PKA state
- ***__IO uint32_t __PKA_HandleTypeDef::ErrorCode***
  PKA Error code
- ***void(* __PKA_HandleTypeDef::OperationCpltCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA End of operation callback
- ***void(* __PKA_HandleTypeDef::ErrorCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA Error callback
- ***void(* __PKA_HandleTypeDef::MspInitCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA Msp Init callback
- ***void(* __PKA_HandleTypeDef::MspDeInitCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA Msp DeInit callback

54.1.2 PKA_ECCMulInTypeDef

PKA_ECCMulInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t scalarMulSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coefA***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * pointX***
- ***const uint8_t * pointY***
- ***const uint8_t * scalarMul***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECCMulInTypeDef::scalarMulSize***
  Number of element in scalarMul array
- ***uint32_t PKA_ECCMulInTypeDef::modulusSize***
  Number of element in modulus, coefA, pointX and pointY arrays
- ***uint32_t PKA_ECCMulInTypeDef::coefSign***
  Curve coefficient a sign

- ***const uint8_t* PKA_ECCMulInTypeDef::coefA***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::coefB***
  pointer to curve coefficient b
- ***const uint8_t* PKA_ECCMulInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::pointX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::pointY***
  Pointer to point P coordinate yP (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::scalarMul***
  Pointer to scalar multiplier k (Array of scalarMulSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::primeOrder***
  pointer to order of the curve

54.1.3 PKA_PointCheckInTypeDef

PKA_PointCheckInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coefA***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * pointX***
- ***const uint8_t * pointY***
- ***const uint32_t * pMontgomeryParam***

Field Documentation

- ***uint32_t PKA_PointCheckInTypeDef::modulusSize***
  Number of element in coefA, coefB, modulus, pointX and pointY arrays
- ***uint32_t PKA_PointCheckInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_PointCheckInTypeDef::coefA***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::coefB***
  Pointer to curve coefficient b (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::pointX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::pointY***
  Pointer to point P coordinate yP (Array of modulusSize elements)
- ***const uint32_t* PKA_PointCheckInTypeDef::pMontgomeryParam***
  pointer to montgomery param R2 (modulus N)

54.1.4 PKA_RSACRTExpInTypeDef

PKA_RSACRTExpInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t size***
- ***const uint8_t * pOpDp***
- ***const uint8_t * pOpDq***
- ***const uint8_t * pOpQinv***
- ***const uint8_t * pPrimeP***
- ***const uint8_t * pPrimeQ***

- ***const uint8_t * popA***

Field Documentation

- ***uint32_t PKA_RSACRTExpInTypeDef::size***
  Number of element in popA array
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pOpDp***
  Pointer to operand dP (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pOpDq***
  Pointer to operand dQ (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pOpQinv***
  Pointer to operand qinv (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pPrimeP***
  Pointer to prime p (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pPrimeQ***
  Pointer to prime Q (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::popA***
  Pointer to operand A (Array of size elements)

54.1.5 PKA_ECDSAVerifInTypeDef

PKA_ECDSAVerifInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t primeOrderSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coef***
- ***const uint8_t * modulus***
- ***const uint8_t * basePointX***
- ***const uint8_t * basePointY***
- ***const uint8_t * pPubKeyCurvePtX***
- ***const uint8_t * pPubKeyCurvePtY***
- ***const uint8_t * RSign***
- ***const uint8_t * SSign***
- ***const uint8_t * hash***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECDSAVerifInTypeDef::primeOrderSize***
  Number of element in primeOrder array
- ***uint32_t PKA_ECDSAVerifInTypeDef::modulusSize***
  Number of element in modulus array
- ***uint32_t PKA_ECDSAVerifInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::coef***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::basePointX***
  Pointer to curve base point xG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::basePointY***
  Pointer to curve base point yG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::pPubKeyCurvePtX***
  Pointer to public-key curve point xQ (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::pPubKeyCurvePtY***
  Pointer to public-key curve point yQ (Array of modulusSize elements)

- ***const uint8_t* PKA_ECDSAVerifInTypeDef::RSign***
  Pointer to signature part r (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::SSign***
  Pointer to signature part s (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::hash***
  Pointer to hash of the message e (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::primeOrder***
  Pointer to order of the curve n (Array of primeOrderSize elements)

54.1.6 PKA_ECDSASignInTypeDef

PKA_ECDSASignInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t primeOrderSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coef***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * integer***
- ***const uint8_t * basePointX***
- ***const uint8_t * basePointY***
- ***const uint8_t * hash***
- ***const uint8_t * privateKey***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECDSASignInTypeDef::primeOrderSize***
  Number of element in primeOrder array
- ***uint32_t PKA_ECDSASignInTypeDef::modulusSize***
  Number of element in modulus array
- ***uint32_t PKA_ECDSASignInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_ECDSASignInTypeDef::coef***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::coefB***
  Pointer to B coefficient (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::integer***
  Pointer to random integer k (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::basePointX***
  Pointer to curve base point xG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::basePointY***
  Pointer to curve base point yG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::hash***
  Pointer to hash of the message (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::privateKey***
  Pointer to private key d (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::primeOrder***
  Pointer to order of the curve n (Array of primeOrderSize elements)

54.1.7 PKA_ECDSASignOutTypeDef

PKA_ECDSASignOutTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint8_t * RSign***
- ***uint8_t * SSign***

Field Documentation

- ***uint8_t* PKA_ECDSASignOutTypeDef::RSign***
  Pointer to signature part r (Array of modulusSize elements)
- ***uint8_t* PKA_ECDSASignOutTypeDef::SSign***
  Pointer to signature part s (Array of modulusSize elements)

54.1.8 PKA_ECDSASignOutExtParamTypeDef

PKA_ECDSASignOutExtParamTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint8_t * ptX***
- ***uint8_t * ptY***

Field Documentation

- ***uint8_t* PKA_ECDSASignOutExtParamTypeDef::ptX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***uint8_t* PKA_ECDSASignOutExtParamTypeDef::ptY***
  Pointer to point P coordinate yP (Array of modulusSize elements)

54.1.9 PKA_ECCCompleteAdditionOutTypeDef

PKA_ECCCompleteAdditionOutTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint8_t * ptX***
- ***uint8_t * ptY***
- ***uint8_t * ptZ***

Field Documentation

- ***uint8_t* PKA_ECCCompleteAdditionOutTypeDef::ptX***
  pointer to point P coordinate xP
- ***uint8_t* PKA_ECCCompleteAdditionOutTypeDef::ptY***
  pointer to point P coordinate yP
- ***uint8_t* PKA_ECCCompleteAdditionOutTypeDef::ptZ***
  pointer to point P coordinate zP

54.1.10 PKA_ModExpInTypeDef

PKA_ModExpInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t expSize***
- ***uint32_t OpSize***
- ***const uint8_t * pExp***
- ***const uint8_t * pOp1***
- ***const uint8_t * pMod***

Field Documentation

- ***uint32_t PKA_ModExpInTypeDef::expSize***
  Number of element in pExp array
- ***uint32_t PKA_ModExpInTypeDef::OpSize***
  Number of element in pOp1 and pMod arrays
- ***const uint8_t* PKA_ModExpInTypeDef::pExp***
  Pointer to Exponent (Array of expSize elements)
- ***const uint8_t* PKA_ModExpInTypeDef::pOp1***
  Pointer to Operand (Array of OpSize elements)
- ***const uint8_t* PKA_ModExpInTypeDef::pMod***
  Pointer to modulus (Array of OpSize elements)

54.1.11 PKA_ModExpProtectModeInTypeDef

PKA_ModExpProtectModeInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t expSize***
- ***uint32_t OpSize***
- ***const uint8_t * pOp1***
- ***const uint8_t * pExp***
- ***const uint8_t * pMod***
- ***const uint8_t * pPhi***

Field Documentation

- ***uint32_t PKA_ModExpProtectModeInTypeDef::expSize***
  Size of the operand in bytes
- ***uint32_t PKA_ModExpProtectModeInTypeDef::OpSize***
  Size of the operand in bytes
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pOp1***
  Pointer to Operand 1
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pExp***
  Pointer to Exponent
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pMod***
  Pointer to Operand 1
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pPhi***
  Pointer to Phi value

54.1.12 PKA_ModExpFastModeInTypeDef

PKA_ModExpFastModeInTypeDef is defined in the stm32h5xx_hal_pka.h

Data Fields

- ***uint32_t expSize***
- ***uint32_t OpSize***
- ***const uint8_t * pExp***
- ***const uint8_t * pOp1***
- ***const uint8_t * pMod***
- ***const uint32_t * pMontgomeryParam***

Field Documentation

- ***uint32_t PKA_ModExpFastModeInTypeDef::expSize***
  Number of element in pExp and pMontgomeryParam arrays
- ***uint32_t PKA_ModExpFastModeInTypeDef::OpSize***
  Number of element in pOp1 and pMod arrays

54.2 PKA Firmware driver API description

The following section lists the various functions of the PKA library.

54.2.1 How to use this driver

The PKA HAL driver can be used as follows:

1. Declare a PKA_HandleTypeDef handle structure, for example: PKA_HandleTypeDef hpka;
2. Initialize the PKA low level resources by implementing the HAL_PKA_MspInit() API:
   a. Enable the PKA interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the PKA interrupt priority
      - Enable the NVIC PKA IRQ Channel
3. Initialize the PKA registers by calling the HAL_PKA_Init() API which trig HAL_PKA_MspInit().
4. Fill entirely the input structure corresponding to your operation: For instance: PKA_ModExpInTypeDef for HAL_PKA_ModExp().
5. Execute the operation (in polling or interrupt) and check the returned value.
6. Retrieve the result of the operation (For instance, HAL_PKA_ModExp_GetResult for HAL_PKA_ModExp operation). The function to gather the result is different for each kind of operation. The correspondence can be found in the following section.
7. Call the function HAL_PKA_DeInit() to restore the default configuration which trig HAL_PKA_MspDeInit().

High level operation

- Input structure requires buffers as uint8_t array.
- Output structure requires buffers as uint8_t array.
- Modular exponentiation using:
  – HAL_PKA_ModExp().
  – HAL_PKA_ModExp_IT().
  – HAL_PKA_ModExpFastMode().
  – HAL_PKA_ModExpFastMode_IT().
  – HAL_PKA_ModExpProtectMode().
  – HAL_PKA_ModExpProtectMode_IT().
  – HAL_PKA_ModExp_GetResult() to retrieve the result of the operation.
- RSA Chinese Remainder Theorem (CRT) using:
  – HAL_PKA_RSACRTExp().
  – HAL_PKA_RSACRTExp_IT().
  – HAL_PKA_RSACRTExp_GetResult() to retrieve the result of the operation.

- ECC Point Check using:
  - HAL_PKA_PointCheck().
  - HAL_PKA_PointCheck_IT().
  - HAL_PKA_PointCheck_IsOnCurve() to retrieve the result of the operation.
- ECDSA Sign
  - HAL_PKA_ECDSASign().
  - HAL_PKA_ECDSASign_IT().
  - HAL_PKA_ECDSASign_GetResult() to retrieve the result of the operation.
- ECDSA Verify
  - HAL_PKA_ECDSAVerif().
  - HAL_PKA_ECDSAVerif_IT().
  - HAL_PKA_ECDSAVerif_IsValidSignature() to retrieve the result of the operation.
- ECC Scalar Multiplication using:
  - HAL_PKA_ECCMul().
  - HAL_PKA_ECCMul_IT().
  - HAL_PKA_ECCMul_GetResult() to retrieve the result of the operation.
- ECC double base ladder using:
  - HAL_PKA_ECCDoubleBaseLadder().
  - HAL_PKA_ECCDoubleBaseLadder_IT().
  - HAL_PKA_ECCDoubleBaseLadder_GetResult() to retrieve the result of the operation.
- ECC projective to affine using:
  - HAL_PKA_ECCProjective2Affine().
  - HAL_PKA_ECCProjective2Affine_IT().
  - HAL_PKA_ECCProjective2Affine_GetResult() to retrieve the result of the operation.
- ECC complete addition using:
  - HAL_PKA_ECCCompleteAddition().
  - HAL_PKA_ECCCompleteAddition_IT().
  - HAL_PKA_ECCCompleteAddition_GetResult() to retrieve the result of the operation.

Low level operation

- Input structure requires buffers as uint32_t array.
- Output structure requires buffers as uint32_t array.
- Arithmetic addition using:
  - HAL_PKA_Add().
  - HAL_PKA_Add_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation. The resulting size can be the input parameter or the input parameter size + 1 (overflow).
- Arithmetic subtraction using:
  - HAL_PKA_Sub().
  - HAL_PKA_Sub_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Arithmetic multiplication using:
  - HAL_PKA_Mul().
  - HAL_PKA_Mul_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Comparison using:
  - HAL_PKA_Cmp().
  - HAL_PKA_Cmp_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.

- Modular addition using:
  - HAL_PKA_ModAdd().
  - HAL_PKA_ModAdd_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Modular subtraction using:
  - HAL_PKA_ModSub().
  - HAL_PKA_ModSub_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Modular inversion using:
  - HAL_PKA_ModInv().
  - HAL_PKA_ModInv_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Modular reduction using:
  - HAL_PKA_ModRed().
  - HAL_PKA_ModRed_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Montgomery multiplication using:
  - HAL_PKA_MontgomeryMul().
  - HAL_PKA_MontgomeryMul_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.

Montgomery parameter

Polling mode operation

- When an operation is started in polling mode, the function returns when:
  - A timeout is encounter.
  - The operation is completed.

Interrupt mode operation

- Add HAL_PKA_IRQHandler to the IRQHandler of PKA.
- Enable the IRQ using HAL_NVIC_EnableIRQ().
- When an operation is started in interrupt mode, the function returns immediately.
- When the operation is completed, the callback HAL_PKA_OperationCpltCallback is called.
- When an error is encountered, the callback HAL_PKA_ErrorCallback is called.
- To stop any operation in interrupt mode, use HAL_PKA_Abort().

Utilities

- To clear the PKA RAM, use HAL_PKA_RAMReset().
- To get current state, use HAL_PKA_GetState().
- To get current error, use HAL_PKA_GetError().

Callback registration

The compilation flag USE_HAL_PKA_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_PKA_RegisterCallback() to register an interrupt callback.

Function HAL_PKA_RegisterCallback() allows to register following callbacks:

- OperationCpltCallback : callback for End of operation.
- ErrorCallback : callback for error detection.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_PKA_UnRegisterCallback to reset a callback to the default weak function.

HAL_PKA_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- OperationCpltCallback : callback for End of operation.
- ErrorCallback : callback for error detection.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

By default, after the HAL_PKA_Init() and when the state is HAL_PKA_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_PKA_OperationCpltCallback(), HAL_PKA_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_PKA_Init()/ HAL_PKA_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_PKA_Init()/ HAL_PKA_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_PKA_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_PKA_STATE_READY or HAL_PKA_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_PKA_RegisterCallback() before calling HAL_PKA_DeInit() or HAL_PKA_Init() function.

When the compilation flag USE_HAL_PKA_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

54.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the PKAx peripheral:

- User must implement HAL_PKA_MspInit() function in which he configures all related peripherals resources (CLOCK, IT and NVIC).
- Call the function HAL_PKA_Init() to configure the device.
- Call the function HAL_PKA_DeInit() to restore the default configuration of the selected PKAx peripheral.

This section contains the following APIs:

- ***HAL_PKA_Init()***
- ***HAL_PKA_DeInit()***
- ***HAL_PKA_MspInit()***
- ***HAL_PKA_MspDeInit()***
- ***HAL_PKA_RegisterCallback()***
- ***HAL_PKA_UnRegisterCallback()***

54.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PKA operations.

1. There are two modes of operation:
   - Blocking mode : The operation is performed in the polling mode. These functions return when data operation is completed.
   - No-Blocking mode : The operation is performed using Interrupts. These functions return immediately. The end of the operation is indicated by HAL_PKA_ErrorCallback in case of error. The end of the operation is indicated by HAL_PKA_OperationCpltCallback in case of success. To stop any operation in interrupt mode, use HAL_PKA_Abort().

2. Blocking mode functions are :
   - HAL_PKA_ModExp()
   - HAL_PKA_ModExpFastMode()
   - HAL_PKA_ModExpProtectMode()
   - HAL_PKA_ModExp_GetResult();
   - HAL_PKA_ECDSASign()
   - HAL_PKA_ECDSASign_GetResult();
   - HAL_PKA_ECDSAVerif()
   - HAL_PKA_ECDSAVerif_IsValidSignature();
   - HAL_PKA_RSACRTExp()
   - HAL_PKA_RSACRTExp_GetResult();
   - HAL_PKA_PointCheck()
   - HAL_PKA_PointCheck_IsOnCurve();
   - HAL_PKA_ECCMul()
   - HAL_PKA_ECCMulFastMode()
   - HAL_PKA_ECCMul_GetResult();
   - HAL_PKA_ECCDoubleBaseLadder()
   - HAL_PKA_ECCDoubleBaseLadder_GetResult();
   - HAL_PKA_ECCProjective2Affine()
   - HAL_PKA_ECCProjective2Affine_GetResult();
   - HAL_PKA_ECCCompleteAddition()
   - HAL_PKA_ECCCompleteAddition_GetResult();
   - HAL_PKA_Add()
   - HAL_PKA_Sub()
   - HAL_PKA_Cmp()
   - HAL_PKA_Mul()
   - HAL_PKA_ModAdd()
   - HAL_PKA_ModSub()
   - HAL_PKA_ModInv()
   - HAL_PKA_ModRed()
   - HAL_PKA_MontgomeryMul()
   - HAL_PKA_Arithmetic_GetResult(P);
   - HAL_PKA_MontgomeryParam()
   - HAL_PKA_MontgomeryParam_GetResult();

3. No-Blocking mode functions with Interrupt are :
   - HAL_PKA_ModExp_IT();
   - HAL_PKA_ModExpFastMode_IT();
   - HAL_PKA_ModExpProtectMode_IT()
   - HAL_PKA_ModExp_GetResult();
   - HAL_PKA_ECDSASign_IT();
   - HAL_PKA_ECDSASign_GetResult();
   - HAL_PKA_ECDSAVerif_IT();
   - HAL_PKA_ECDSAVerif_IsValidSignature();
   - HAL_PKA_RSACRTExp_IT();
   - HAL_PKA_RSACRTExp_GetResult();
   - HAL_PKA_PointCheck_IT();
   - HAL_PKA_PointCheck_IsOnCurve();
   - HAL_PKA_ECCMul_IT();
   - HAL_PKA_ECCMulFastMode_IT();
   - HAL_PKA_ECCMul_GetResult();
   - HAL_PKA_ECCDoubleBaseLadder_IT()
   - HAL_PKA_ECCDoubleBaseLadder_GetResult();
   - HAL_PKA_ECCProjective2Affine_IT()
   - HAL_PKA_ECCProjective2Affine_GetResult();
   - HAL_PKA_ECCCompleteAddition_IT()
   - HAL_PKA_ECCCompleteAddition_GetResult();
   - HAL_PKA_Add_IT();
   - HAL_PKA_Sub_IT();
   - HAL_PKA_Cmp_IT();
   - HAL_PKA_Mul_IT();
   - HAL_PKA_ModAdd_IT();
   - HAL_PKA_ModSub_IT();
   - HAL_PKA_ModInv_IT();
   - HAL_PKA_ModRed_IT();
   - HAL_PKA_MontgomeryMul_IT();
   - HAL_PKA_Arithmetic_GetResult();
   - HAL_PKA_MontgomeryParam_IT();
   - HAL_PKA_MontgomeryParam_GetResult();
   - HAL_PKA_Abort();

This section contains the following APIs:

- ***HAL_PKA_ModExp()***
- ***HAL_PKA_ModExp_IT()***
- ***HAL_PKA_ModExpFastMode()***
- ***HAL_PKA_ModExpFastMode_IT()***
- ***HAL_PKA_ModExpProtectMode()***

54.2.4 Peripheral State and Error functions

This subsection permit to get in run-time the status of the peripheral.
This section contains the following APIs:

- *HAL_PKA_GetState()*
- *HAL_PKA_GetError()*

54.2.5 Detailed description of functions

HAL_PKA_Init

Function name

HAL_StatusTypeDef HAL_PKA_Init (PKA_HandleTypeDef * hpka)

Function description

Initialize the PKA according to the specified parameters in the PKA_InitTypeDef and initialize the associated handle.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_DeInit

Function name

HAL_StatusTypeDef HAL_PKA_DeInit (PKA_HandleTypeDef * hpka)

Function description

DeInitialize the PKA peripheral.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_MspInit

Function name

void HAL_PKA_MspInit (PKA_HandleTypeDef * hpka)

Function description

Initialize the PKA MSP.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_MspDeInit

Function name

void HAL_PKA_MspDeInit (PKA_HandleTypeDef * hpka)

Function description

DeInitialize the PKA MSP.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_PKA_RegisterCallback (PKA_HandleTypeDef * hpka, HAL_PKA_CallbackIDTypeDef CallbackID, pPKA_CallbackTypeDef pCallback)

Function description

Register a User PKA Callback To be used instead of the weak predefined callback.

Parameters

- **hpka:** Pointer to a PKA_HandleTypeDef structure that contains the configuration information for the specified PKA.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_PKA_OPERATION_COMPLETE_CB_ID End of operation callback ID
  - HAL_PKA_ERROR_CB_ID Error callback ID
  - HAL_PKA_MSPINIT_CB_ID MspInit callback ID
  - HAL_PKA_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_PKA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_PKA_UnRegisterCallback (PKA_HandleTypeDef * hpka, HAL_PKA_CallbackIDTypeDef CallbackID)

Function description

Unregister a PKA Callback PKA callback is redirected to the weak predefined callback.

Parameters

- **hpka:** Pointer to a PKA_HandleTypeDef structure that contains the configuration information for the specified PKA.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_PKA_OPERATION_COMPLETE_CB_ID End of operation callback ID
  - HAL_PKA_ERROR_CB_ID Error callback ID
  - HAL_PKA_MSPINIT_CB_ID MspInit callback ID
  - HAL_PKA_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_PKA_ModExp

Function name

HAL_StatusTypeDef HAL_PKA_ModExp (PKA_HandleTypeDef * hpka, PKA_ModExpInTypeDef * in, uint32_t Timeout)

Function description

Modular exponentiation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModExp_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModExp_IT (PKA_HandleTypeDef * hpka, PKA_ModExpInTypeDef * in)

Function description

Modular exponentiation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModExpFastMode

Function name

HAL_StatusTypeDef HAL_PKA_ModExpFastMode (PKA_HandleTypeDef * hpka, PKA_ModExpFastModeInTypeDef * in, uint32_t Timeout)

Function description

Modular exponentiation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModExpFastMode_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModExpFastMode_IT (PKA_HandleTypeDef * hpka, PKA_ModExpFastModeInTypeDef * in)

Function description

Modular exponentiation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModExpProtectMode

Function name

HAL_StatusTypeDef HAL_PKA_ModExpProtectMode (PKA_HandleTypeDef * hpka, PKA_ModExpProtectModeInTypeDef * in, uint32_t Timeout)

Function description

Modular exponentiation (protected) in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModExpProtectMode_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModExpProtectMode_IT (PKA_HandleTypeDef * hpka, PKA_ModExpProtectModeInTypeDef * in)

Function description

Modular exponentiation (protected) in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModExp_GetResult

Function name

void HAL_PKA_ModExp_GetResult (PKA_HandleTypeDef * hpka, uint8_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** Output buffer

Return values

- **HAL:** status

HAL_PKA_ECDSASign

Function name

HAL_StatusTypeDef HAL_PKA_ECDSASign (PKA_HandleTypeDef * hpka, PKA_ECDSASignInTypeDef * in, uint32_t Timeout)

Function description

Sign a message using elliptic curves over prime fields in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECDSASign_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECDSASign_IT (PKA_HandleTypeDef * hpka, PKA_ECDSASignInTypeDef * in)

Function description

Sign a message using elliptic curves over prime fields in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECDSASign_GetResult

Function name

void HAL_PKA_ECDSASign_GetResult (PKA_HandleTypeDef * hpka, PKA_ECDSASignOutTypeDef * out, PKA_ECDSASignOutExtParamTypeDef * outExt)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information
- **outExt:** Additional Output information (facultative)

HAL_PKA_ECDSAVerif

Function name

HAL_StatusTypeDef HAL_PKA_ECDSAVerif (PKA_HandleTypeDef * hpka, PKA_ECDSAVerifInTypeDef * in, uint32_t Timeout)

Function description

Verify the validity of a signature using elliptic curves over prime fields in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECDSAVerif_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECDSAVerif_IT (PKA_HandleTypeDef * hpka, PKA_ECDSAVerifInTypeDef * in)

Function description

Verify the validity of a signature using elliptic curves over prime fields in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECDSAVerif_IsValidSignature

Function name

uint32_t HAL_PKA_ECDSAVerif_IsValidSignature (PKA_HandleTypeDef const *const hpka)

Function description

Return the result of the ECDSA verification operation.

Parameters

- **hpka:** PKA handle

Return values

- **1:** if signature is verified, 0 in other case

HAL_PKA_RSACRTExp

Function name

HAL_StatusTypeDef HAL_PKA_RSACRTExp (PKA_HandleTypeDef * hpka, PKA_RSACRTExpInTypeDef * in, uint32_t Timeout)

Function description

RSA CRT exponentiation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_RSACRTExp_IT

Function name

HAL_StatusTypeDef HAL_PKA_RSACRTExp_IT (PKA_HandleTypeDef * hpka, PKA_RSACRTExpInTypeDef * in)

Function description

RSA CRT exponentiation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_RSACRTExp_GetResult

Function name

void HAL_PKA_RSACRTExp_GetResult (PKA_HandleTypeDef * hpka, uint8_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** Pointer to memory location to receive the result of the operation

Return values

- **HAL:** status

HAL_PKA_PointCheck

Function name

HAL_StatusTypeDef HAL_PKA_PointCheck (PKA_HandleTypeDef * hpka, PKA_PointCheckInTypeDef * in, uint32_t Timeout)

Function description

Point on elliptic curve check in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_PointCheck_IT

Function name

HAL_StatusTypeDef HAL_PKA_PointCheck_IT (PKA_HandleTypeDef * hpka, PKA_PointCheckInTypeDef * in)

Function description

Point on elliptic curve check in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_PointCheck_IsOnCurve

Function name

uint32_t HAL_PKA_PointCheck_IsOnCurve (PKA_HandleTypeDef const *const hpka)

Function description

Return the result of the point check operation.

Parameters

- **hpka:** PKA handle

Return values

- **1:** if point is on curve, 0 in other case

HAL_PKA_ECCMul

Function name

HAL_StatusTypeDef HAL_PKA_ECCMul (PKA_HandleTypeDef * hpka, PKA_ECCMulInTypeDef * in, uint32_t Timeout)

Function description

ECC scalar multiplication in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCMul_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCMul_IT (PKA_HandleTypeDef * hpka, PKA_ECCMulInTypeDef * in)

Function description

ECC scalar multiplication in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCMul_GetResult

Function name

void HAL_PKA_ECCMul_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCMulOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_Add

Function name

HAL_StatusTypeDef HAL_PKA_Add (PKA_HandleTypeDef * hpka, PKA_AddInTypeDef * in, uint32_t Timeout)

Function description

Arithmetic addition in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Add_IT

Function name

HAL_StatusTypeDef HAL_PKA_Add_IT (PKA_HandleTypeDef * hpka, PKA_AddInTypeDef * in)

Function description

Arithmetic addition in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Sub

Function name

HAL_StatusTypeDef HAL_PKA_Sub (PKA_HandleTypeDef * hpka, PKA_SubInTypeDef * in, uint32_t Timeout)

Function description

Arithmetic subtraction in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Sub_IT

Function name

HAL_StatusTypeDef HAL_PKA_Sub_IT (PKA_HandleTypeDef * hpka, PKA_SubInTypeDef * in)

Function description

Arithmetic subtraction in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Cmp

Function name

HAL_StatusTypeDef HAL_PKA_Cmp (PKA_HandleTypeDef * hpka, PKA_CmpInTypeDef * in, uint32_t Timeout)

Function description

Comparison in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Cmp_IT

Function name

HAL_StatusTypeDef HAL_PKA_Cmp_IT (PKA_HandleTypeDef * hpka, PKA_CmpInTypeDef * in)

Function description

Comparison in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Mul

Function name

HAL_StatusTypeDef HAL_PKA_Mul (PKA_HandleTypeDef * hpka, PKA_MulInTypeDef * in, uint32_t Timeout)

Function description

Arithmetic multiplication in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Mul_IT

Function name

HAL_StatusTypeDef HAL_PKA_Mul_IT (PKA_HandleTypeDef * hpka, PKA_MulInTypeDef * in)

Function description

Arithmetic multiplication in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModAdd

Function name

HAL_StatusTypeDef HAL_PKA_ModAdd (PKA_HandleTypeDef * hpka, PKA_ModAddInTypeDef * in, uint32_t Timeout)

Function description

Modular addition in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModAdd_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModAdd_IT (PKA_HandleTypeDef * hpka, PKA_ModAddInTypeDef * in)

Function description

Modular addition in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModSub

Function name

HAL_StatusTypeDef HAL_PKA_ModSub (PKA_HandleTypeDef * hpka, PKA_ModSubInTypeDef * in, uint32_t Timeout)

Function description

Modular subtraction in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModSub_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModSub_IT (PKA_HandleTypeDef * hpka, PKA_ModSubInTypeDef * in)

Function description

Modular subtraction in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModInv

Function name

HAL_StatusTypeDef HAL_PKA_ModInv (PKA_HandleTypeDef * hpka, PKA_ModInvInTypeDef * in, uint32_t Timeout)

Function description

Modular inversion in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModInv_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModInv_IT (PKA_HandleTypeDef * hpka, PKA_ModInvInTypeDef * in)

Function description

Modular inversion in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModRed

Function name

HAL_StatusTypeDef HAL_PKA_ModRed (PKA_HandleTypeDef * hpka, PKA_ModRedInTypeDef * in, uint32_t Timeout)

Function description

Modular reduction in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModRed_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModRed_IT (PKA_HandleTypeDef * hpka, PKA_ModRedInTypeDef * in)

Function description

Modular reduction in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_MontgomeryMul

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryMul (PKA_HandleTypeDef * hpka, PKA_MontgomeryMulInTypeDef * in, uint32_t Timeout)

Function description

Montgomery multiplication in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_MontgomeryMul_IT

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryMul_IT (PKA_HandleTypeDef * hpka, PKA_MontgomeryMulInTypeDef * in)

Function description

Montgomery multiplication in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Arithmetic_GetResult

Function name

void HAL_PKA_Arithmetic_GetResult (PKA_HandleTypeDef * hpka, uint32_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** Pointer to memory location to receive the result of the operation

HAL_PKA_MontgomeryParam

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryParam (PKA_HandleTypeDef * hpka, PKA_MontgomeryParamInTypeDef * in, uint32_t Timeout)

Function description

Montgomery parameter computation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_MontgomeryParam_IT

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryParam_IT (PKA_HandleTypeDef * hpka, PKA_MontgomeryParamInTypeDef * in)

Function description

Montgomery parameter computation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_MontgomeryParam_GetResult

Function name

void HAL_PKA_MontgomeryParam_GetResult (PKA_HandleTypeDef * hpka, uint32_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** pointer to buffer where the result will be copied

Return values

- **HAL:** status

HAL_PKA_ECCDoubleBaseLadder

Function name

HAL_StatusTypeDef HAL_PKA_ECCDoubleBaseLadder (PKA_HandleTypeDef * hpka, PKA_ECCDoubleBaseLadderInTypeDef * in, uint32_t Timeout)

Function description

ECC double base ladder in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCDoubleBaseLadder_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCDoubleBaseLadder_IT (PKA_HandleTypeDef * hpka, PKA_ECCDoubleBaseLadderInTypeDef * in)

Function description

ECC double base ladder in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCDoubleBaseLadder_GetResult

Function name

void HAL_PKA_ECCDoubleBaseLadder_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCDoubleBaseLadderOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_ECCProjective2Affine

Function name

HAL_StatusTypeDef HAL_PKA_ECCProjective2Affine (PKA_HandleTypeDef * hpka, PKA_ECCProjective2AffineInTypeDef * in, uint32_t Timeout)

Function description

ECC projective to affine in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCProjective2Affine_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCProjective2Affine_IT (PKA_HandleTypeDef * hpka, PKA_ECCProjective2AffineInTypeDef * in)

Function description

ECC projective to affine in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCProjective2Affine_GetResult

Function name

void HAL_PKA_ECCProjective2Affine_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCProjective2AffineOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_ECCCompleteAddition

Function name

HAL_StatusTypeDef HAL_PKA_ECCCompleteAddition (PKA_HandleTypeDef * hpka, PKA_ECCCompleteAdditionInTypeDef * in, uint32_t Timeout)

Function description

ECC complete addition in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCCompleteAddition_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCCompleteAddition_IT (PKA_HandleTypeDef * hpka, PKA_ECCCompleteAdditionInTypeDef * in)

Function description

ECC complete addition in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCCompleteAddition_GetResult

Function name

void HAL_PKA_ECCCompleteAddition_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCCompleteAdditionOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_Abort

Function name

HAL_StatusTypeDef HAL_PKA_Abort (PKA_HandleTypeDef * hpka)

Function description

Abort any ongoing operation.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_RAMReset

Function name

void HAL_PKA_RAMReset (PKA_HandleTypeDef * hpka)

Function description

Reset the PKA RAM.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_OperationCpltCallback

Function name

void HAL_PKA_OperationCpltCallback (PKA_HandleTypeDef * hpka)

Function description

Process completed callback.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_ErrorCallback

Function name

void HAL_PKA_ErrorCallback (PKA_HandleTypeDef * hpka)

Function description

Error callback.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_IRQHandler

Function name

void HAL_PKA_IRQHandler (PKA_HandleTypeDef * hpka)

Function description

This function handles PKA event interrupt request.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_GetState

Function name

HAL_PKA_StateTypeDef HAL_PKA_GetState (const PKA_HandleTypeDef * hpka)

Function description

Return the PKA handle state.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_GetError

Function name

uint32_t HAL_PKA_GetError (const PKA_HandleTypeDef * hpka)

Function description

Return the PKA error code.

Parameters

- **hpka:** PKA handle

Return values

- **PKA:** error code

54.3 PKA Firmware driver defines

The following section lists the various define and macros of the module.

54.3.1 PKA

PKA

PKA Error Code definition

HAL_PKA_ERROR_NONE

HAL_PKA_ERROR_ADDRERR

HAL_PKA_ERROR_RAMERR

HAL_PKA_ERROR_TIMEOUT

HAL_PKA_ERROR_OPERATION

HAL_PKA_ERROR_INVALID_CALLBACK

Invalid Callback error

PKA Exported Macros

__HAL_PKA_RESET_HANDLE_STATE

Description:

- Reset PKA handle state.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

__HAL_PKA_ENABLE_IT

Description:

- Enable the specified PKA interrupt.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  - PKA_IT_PROCEND End Of Operation interrupt enable
  - PKA_IT_ADDRERR Address error interrupt enable
  - PKA_IT_RAMERR RAM error interrupt enable
  - PKA_IT_OPERR Operation error interrupt enable

Return value:

- None

__HAL_PKA_DISABLE_IT

Description:

- Disable the specified PKA interrupt.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  - PKA_IT_PROCEND End Of Operation interrupt enable
  - PKA_IT_ADDRERR Address error interrupt enable
  - PKA_IT_RAMERR RAM error interrupt enable
  - PKA_IT_OPERR Operation error interrupt enable

Return value:

- None

__HAL_PKA_GET_IT_SOURCE

Description:

- Check whether the specified PKA interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __INTERRUPT__: specifies the PKA interrupt source to check. This parameter can be one of the following values:
  - PKA_IT_PROCEND End Of Operation interrupt enable
  - PKA_IT_ADDRERR Address error interrupt enable
  - PKA_IT_RAMERR RAM error interrupt enable
  - PKA_IT_OPERR Operation error interrupt enable

Return value:

- The: new state of __INTERRUPT__ (SET or RESET)

__HAL_PKA_GET_FLAG

Description:

- Check whether the specified PKA flag is set or not.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - PKA_FLAG_PROCEND End Of Operation
  - PKA_FLAG_ADDRERR Address error
  - PKA_FLAG_RAMERR RAM error
  - PKA_FLAG_OPERR Operation error

Return value:

- The: new state of __FLAG__ (SET or RESET)

__HAL_PKA_CLEAR_FLAG

Description:

- Clear the PKA pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - PKA_FLAG_PROCEND End Of Operation
  - PKA_FLAG_ADDRERR Address error
  - PKA_FLAG_RAMERR RAM error
  - PKA_FLAG_OPERR Operation error

Return value:

- None

__HAL_PKA_ENABLE

Description:

- Enable the specified PKA peripheral.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

__HAL_PKA_DISABLE

Description:

- Disable the specified PKA peripheral.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

__HAL_PKA_START

Description:

- Start a PKA operation.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

55 HAL PSSI Generic Driver

55.1 PSSI Firmware driver registers structures

55.1.1 PSSI_InitTypeDef

PSSI_InitTypeDef is defined in the stm32h5xx_hal_pssi.h

Data Fields

- ***uint32_t DataWidth***
- ***uint32_t BusWidth***
- ***uint32_t ControlSignal***
- ***uint32_t ClockPolarity***
- ***uint32_t DataEnablePolarity***
- ***uint32_t ReadyPolarity***

Field Documentation

- ***uint32_t PSSI_InitTypeDef::DataWidth***
- ***uint32_t PSSI_InitTypeDef::BusWidth***
- ***uint32_t PSSI_InitTypeDef::ControlSignal***
- ***uint32_t PSSI_InitTypeDef::ClockPolarity***
- ***uint32_t PSSI_InitTypeDef::DataEnablePolarity***
- ***uint32_t PSSI_InitTypeDef::ReadyPolarity***

55.1.2 PSSI_HandleTypeDef

PSSI_HandleTypeDef is defined in the stm32h5xx_hal_pssi.h

Data Fields

- ***PSSI_TypeDef * Instance***
- ***PSSI_InitTypeDef Init***
- ***uint32_t * pBuffPtr***
- ***uint32_t XferCount***
- ***uint32_t XferSize***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_PSSI_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***PSSI_TypeDef* PSSI_HandleTypeDef::Instance***
  PSSI register base address.
- ***PSSI_InitTypeDef PSSI_HandleTypeDef::Init***
  PSSI Initialization Structure.
- ***uint32_t* PSSI_HandleTypeDef::pBuffPtr***
  PSSI Data buffer.
- ***uint32_t PSSI_HandleTypeDef::XferCount***
  PSSI transfer count
- ***uint32_t PSSI_HandleTypeDef::XferSize***
  PSSI transfer size
- ***DMA_HandleTypeDef* PSSI_HandleTypeDef::hdmatx***
  PSSI Tx DMA Handle parameters
- ***DMA_HandleTypeDef* PSSI_HandleTypeDef::hdmarx***
  PSSI Rx DMA Handle parameters

- ***HAL_LockTypeDef PSSI_HandleTypeDef::Lock***
  PSSI lock.
- ***__IO HAL_PSSI_StateTypeDef PSSI_HandleTypeDef::State***
  PSSI transfer state.
- ***__IO uint32_t PSSI_HandleTypeDef::ErrorCode***
  PSSI error code.

55.2 PSSI Firmware driver API description

The following section lists the various functions of the PSSI library.

55.2.1 How to use this driver

The PSSI HAL driver can be used as follows:

1. Declare a PSSI_HandleTypeDef handle structure, for example: PSSI_HandleTypeDef hpssi;
2. Initialize the PSSI low level resources by implementing the @ref HAL_PSSI_MspInit() API:
   a. Enable the PSSIx interface clock
   b. PSSI pins configuration
      - Enable the clock for the PSSI GPIOs
      - Configure PSSI pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the PSSIx interrupt priority
      - Enable the NVIC PSSI IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare DMA_HandleTypeDef handles structure for the transmit and receive
      - Enable the DMAx interface clock
      - Configure the DMA handle parameters
      - Configure the DMA Tx and Rx
      - Associate the initialized DMA handle to the hpssi DMA Tx and Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx and Rx
3. Configure the Communication Bus Width, Control Signals, Input Polarity and Output Polarity in the hpssi Init structure.
4. Initialize the PSSI registers by calling the @ref HAL_PSSI_Init(), configure also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized @ref HAL_PSSI_MspInit(&hpssi) API.
5. For PSSI IO operations, two operation modes are available within this driver :

Polling mode IO operation

- Transmit an amount of data by byte in blocking mode using @ref HAL_PSSI_Transmit()
- Receive an amount of data by byte in blocking mode using @ref HAL_PSSI_Receive()

DMA mode IO operation

- Transmit an amount of data in non-blocking mode (DMA) using @ref HAL_PSSI_Transmit_DMA()
- At transmission end of transfer, @ref HAL_PSSI_TxCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using @ref HAL_PSSI_Receive_DMA()
- At reception end of transfer, @ref HAL_PSSI_RxCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_RxCpltCallback()
- In case of transfer Error, @ref HAL_PSSI_ErrorCallback() function is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_ErrorCallback()
- Abort a PSSI process communication with Interrupt using @ref HAL_PSSI_Abort_IT()
- End of abort process, @ref HAL_PSSI_AbortCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_AbortCpltCallback()

PSSI HAL driver macros list

Below the list of most used macros in PSSI HAL driver.

- @ref HAL_PSSI_ENABLE : Enable the PSSI peripheral
- @ref HAL_PSSI_DISABLE : Disable the PSSI peripheral
- @ref HAL_PSSI_GET_FLAG : Check whether the specified PSSI flag is set or not
- @ref HAL_PSSI_CLEAR_FLAG : Clear the specified PSSI pending flag
- @ref HAL_PSSI_ENABLE_IT : Enable the specified PSSI interrupt
- @ref HAL_PSSI_DISABLE_IT : Disable the specified PSSI interrupt

Callback registration

Note: You can refer to the PSSI HAL driver header file for more useful macros

55.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the PSSIx peripheral:

- User must implement HAL_PSSI_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_PSSI_Init() to configure the selected device with the selected configuration:
  - Data Width
  - Control Signals
  - Input Clock polarity
  - Output Clock polarity
- Call the function HAL_PSSI_DeInit() to restore the default configuration of the selected PSSIx peripheral.

This section contains the following APIs:

- ***HAL_PSSI_Init()***
- ***HAL_PSSI_DeInit()***
- ***HAL_PSSI_MspInit()***
- ***HAL_PSSI_MspDeInit()***

55.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PSSI data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated the DMA IRQ .
2. Blocking mode functions are :
   - HAL_PSSI_Transmit()
   - HAL_PSSI_Receive()
3. No-Blocking mode functions with DMA are :
   - HAL_PSSI_Transmit_DMA()
   - HAL_PSSI_Receive_DMA()
4. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   - HAL_PSSI_TxCpltCallback()
   - HAL_PSSI_RxCpltCallback()
   - HAL_PSSI_ErrorCallback()
   - HAL_PSSI_AbortCpltCallback()

This section contains the following APIs:

- ***HAL_PSSI_Transmit()***

- *HAL_PSSI_Receive()*
- *HAL_PSSI_Transmit_DMA()*
- *HAL_PSSI_Receive_DMA()*
- *HAL_PSSI_Abort_DMA()*

55.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_PSSI_GetState()*
- *HAL_PSSI_GetError()*

55.2.5 Detailed description of functions

HAL_PSSI_Init

Function name

HAL_StatusTypeDef HAL_PSSI_Init (PSSI_HandleTypeDef * hpssi)

Function description

Initializes the PSSI according to the specified parameters in the PSSI_InitTypeDef and initialize the associated handle.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_DeInit

Function name

HAL_StatusTypeDef HAL_PSSI_DeInit (PSSI_HandleTypeDef * hpssi)

Function description

DeInitialize the PSSI peripheral.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_MspInit

Function name

void HAL_PSSI_MspInit (PSSI_HandleTypeDef * hpssi)

Function description

Initialize the PSSI MSP.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_MspDeInit

Function name

void HAL_PSSI_MspDeInit (PSSI_HandleTypeDef * hpssi)

Function description

De-Initialize the PSSI MSP.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_Transmit

Function name

HAL_StatusTypeDef HAL_PSSI_Transmit (PSSI_HandleTypeDef * hpssi, uint8_t * pData, uint32_t Size, uint32_t Timeout)

Function description

Transmits in master mode an amount of data in blocking mode.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent (in bytes)
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PSSI_Receive

Function name

HAL_StatusTypeDef HAL_PSSI_Receive (PSSI_HandleTypeDef * hpssi, uint8_t * pData, uint32_t Size, uint32_t Timeout)

Function description

Receives an amount of data in blocking mode.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be received (in bytes)
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PSSI_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Transmit_DMA (PSSI_HandleTypeDef * hpssi, uint32_t * pData, uint32_t Size)

Function description

Transmit an amount of data in non-blocking mode with DMA.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent (in bytes)

Return values

- **HAL:** status

HAL_PSSI_Receive_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Receive_DMA (PSSI_HandleTypeDef * hpssi, uint32_t * pData, uint32_t Size)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be received (in bytes)

Return values

- **HAL:** status

HAL_PSSI_Abort_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Abort_DMA (PSSI_HandleTypeDef * hpssi)

Function description

Abort a DMA process communication with Interrupt.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_GetState

Function name

HAL_PSSI_StateTypeDef HAL_PSSI_GetState (const PSSI_HandleTypeDef * hpssi)

Function description

Return the PSSI handle state.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** state

HAL_PSSI_GetError

Function name

uint32_t HAL_PSSI_GetError (const PSSI_HandleTypeDef * hpssi)

Function description

Return the PSSI error code.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **PSSI:** Error Code

HAL_PSSI_IRQHandler

Function name

void HAL_PSSI_IRQHandler (PSSI_HandleTypeDef * hpssi)

Function description

This function handles PSSI event interrupt request.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_TxCpltCallback

Function name

void HAL_PSSI_TxCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

Tx Transfer complete callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_RxCpltCallback

Function name

void HAL_PSSI_RxCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

Rx Transfer complete callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_ErrorCallback

Function name

void HAL_PSSI_ErrorCallback (PSSI_HandleTypeDef * hpssi)

Function description

PSSI error callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_AbortCpltCallback

Function name

void HAL_PSSI_AbortCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

PSSI abort callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

55.3 PSSI Firmware driver defines

The following section lists the various define and macros of the module.

55.3.1 PSSI

PSSI

PSSI Bus Width

HAL_PSSI_8LINES

8 data lines

HAL_PSSI_16LINES

16 data lines

PSSI Data Width

HAL_PSSI_8BITS

8 Bits

HAL_PSSI_16BITS

16 Bits

HAL_PSSI_32BITS

32 Bits

PSSI definitions

PSSI_MAX_NBYTE_SIZE

PSSI_TIMEOUT_TRANSMIT

Timeout Value

PSSI_CR_OUTEN_INPUT

Input Mode

PSSI_CR_OUTEN_OUTPUT

Output Mode

PSSI_CR_DMA_ENABLE

DMA Mode Enable

PSSI_CR_DMA_DISABLE

DMA Mode Disable

PSSI_CR_16BITS

16 Lines Mode

PSSI_CR_8BITS

8 Lines Mode

PSSI_FLAG_RTT1B

1 Byte Fifo Flag

PSSI_FLAG_RTT4B

4 Bytes Fifo Flag

PSSI Error Code

HAL_PSSI_ERROR_NONE

No error

HAL_PSSI_ERROR_NOT_SUPPORTED

Not supported operation

HAL_PSSI_ERROR_UNDER_RUN

FIFO Under-run error

HAL_PSSI_ERROR_OVER_RUN

FIFO Over-run error

HAL_PSSI_ERROR_DMA

Dma error

HAL_PSSI_ERROR_TIMEOUT

Timeout error

PSSI Exported Macros

HAL_PSSI_RESET_HANDLE_STATE

Description:

- Reset PSSI handle state.

Parameters:

- __HANDLE__: specifies the PSSI handle.

Return value:

- None

HAL_PSSI_ENABLE

Description:

- Enable the PSSI.

Parameters:

- __HANDLE__: PSSI handle

Return value:

- None.

HAL_PSSI_DISABLE

Description:

- Disable the PSSI.

Parameters:

- __HANDLE__: PSSI handle

Return value:

- None.

HAL_PSSI_GET_STATUS

Description:

- Get the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_RTT1B: FIFO is ready to transfer one byte
  - PSSI_FLAG_RTT4B: FIFO is ready to transfer four bytes

Return value:

- The: state of FLAG.

HAL_PSSI_GET_FLAG

Description:

- Get the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:

- The: state of FLAG.

HAL_PSSI_CLEAR_FLAG

Description:

- Clear the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:

- None

HAL_PSSI_ENABLE_IT

Description:

- Enable the specified PSSI interrupts.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Configuration error mask

Return value:

- None

HAL_PSSI_DISABLE_IT

Description:

- Disable the specified PSSI interrupts.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be disabled. This parameter can be any combination of the following values:
  - PSSI_IT_OVR_IE: Configuration error mask

Return value:

- None

HAL_PSSI_GET_IT_SOURCE

Description:

- Check whether the specified PSSI interrupt source is enabled or not.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt source to check. This parameter can be one of the following values:
  - PSSI_IT_OVR_IE: Data Buffer overrun/underrun error interrupt mask

Return value:

- The: state of INTERRUPT source.

IS_PSSI_CONTROL_SIGNAL

Description:

- Check whether the PSSI Control signal is valid.

Parameters:

- __CONTROL__: Control signals configuration

Return value:

- Valid: or not.

IS_PSSI_BUSWIDTH

Description:

- Check whether the PSSI Bus Width is valid.

Parameters:

- __BUSWIDTH__: PSSI Bush width

Return value:

- Valid: or not.

IS_PSSI_CLOCK_POLARITY

Description:

- Check whether the PSSI Clock Polarity is valid.

Parameters:

- __CLOCKPOL__: PSSI Clock Polarity

Return value:

- Valid: or not.

IS_PSSI_DE_POLARITY

Description:

- Check whether the PSSI Data Enable Polarity is valid.

Parameters:

- __DEPOL__: PSSI DE Polarity

Return value:

- Valid: or not.

IS_PSSI_RDY_POLARITY

Description:

- Check whether the PSSI Ready Polarity is valid.

Parameters:

- __RDYPOL__: PSSI RDY Polarity

Return value:

- Valid: or not.

PSSI Interrupts

PSSI_FLAG_OVR_RIS

Overrun, Underrun errors flag

PSSI_FLAG_MASK

Overrun, Underrun errors Mask

PSSI_FLAG_OVR_MIS

Overrun, Underrun masked errors flag

PSSI mode

HAL_PSSI_UNIDIRECTIONAL

Uni-directional mode

HAL_PSSI_BIDIRECTIONAL

Bi-directional mode

56 HAL PWR Generic Driver

56.1 PWR Firmware driver registers structures

56.1.1 PWR_PVDTypeDef

PWR_PVDTypeDef is defined in the stm32h5xx_hal_pwr.h

Data Fields

- ***uint32_t PVDLevel***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t PWR_PVDTypeDef::PVDLevel***
  Specifies the PVD detection level. This parameter can be a value of ***PWR_PVD_Detection_Level***.
- ***uint32_t PWR_PVDTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***PWR_PVD_Mode***.

56.2 PWR Firmware driver API description

The following section lists the various functions of the PWR library.

56.2.1 Initialization and De-Initialization Functions

This section contains the following APIs:

- ***HAL_PWR_DeInit()***
- ***HAL_PWR_EnableBkUpAccess()***
- ***HAL_PWR_DisableBkUpAccess()***

56.2.2 Peripheral Control functions

This section contains the following APIs:

- ***HAL_PWR_ConfigPVD()***
- ***HAL_PWR_EnablePVD()***
- ***HAL_PWR_DisablePVD()***
- ***HAL_PWR_EnableWakeUpPin()***
- ***HAL_PWR_DisableWakeUpPin()***
- ***HAL_PWR_EnterSLEEPMode()***
- ***HAL_PWR_EnterSTOPMode()***
- ***HAL_PWR_EnterSTANDBYMode()***
- ***HAL_PWR_EnableSleepOnExit()***
- ***HAL_PWR_DisableSleepOnExit()***
- ***HAL_PWR_EnableSEVOnPend()***
- ***HAL_PWR_DisableSEVOnPend()***
- ***HAL_PWR_PVD_IRQHandler()***
- ***HAL_PWR_PVDCallback()***

56.2.3 PWR Attributes Functions

This section contains the following APIs:

- ***HAL_PWR_ConfigAttributes()***
- ***HAL_PWR_GetConfigAttributes()***

56.2.4 Detailed description of functions

HAL_PWR_DeInit

Function name

void HAL_PWR_DeInit (void)

Function description

Deinitialize the HAL PWR peripheral registers to their default reset values.

Return values

- **None.:**

Notes

- This functionality is not available in this product. The prototype is kept just to maintain compatibility with other products.

HAL_PWR_EnableBkUpAccess

Function name

void HAL_PWR_EnableBkUpAccess (void)

Function description

Enable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).

Return values

- **None.:**

Notes

- After a system reset, the backup domain is protected against possible unwanted write accesses.

HAL_PWR_DisableBkUpAccess

Function name

void HAL_PWR_DisableBkUpAccess (void)

Function description

Disable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).

Return values

- **None:**

HAL_PWR_ConfigPVD

Function name

HAL_StatusTypeDef HAL_PWR_ConfigPVD (const PWR_PVDTypeDef * sConfigPVD)

Function description

Configure the voltage threshold detected by the Programmed Voltage Detector (PVD).

Parameters

- **sConfigPVD:** : Pointer to a PWR_PVDTypeDef structure that contains the PVD configuration information (PVDLevel and EventMode).

Return values

- **None.:**

HAL_PWR_EnablePVD

Function name

void HAL_PWR_EnablePVD (void)

Function description

Enable the programmable voltage detector (PVD).

Return values

- **None.:**

HAL_PWR_DisablePVD

Function name

void HAL_PWR_DisablePVD (void)

Function description

Disable the programmable voltage detector (PVD).

Return values

- **None.:**

HAL_PWR_EnableWakeUpPin

Function name

void HAL_PWR_EnableWakeUpPin (uint32_t WakeUpPinPolarity)

Function description

Enable the WakeUp PINx functionality.

Parameters

- **WakeUpPinPolarity:** : Specifies which Wake-Up pin to enable. This parameter can be one of the following legacy values, which sets the default (rising edge):
  - PWR_WAKEUP_PIN1, PWR_WAKEUP_PIN2, PWR_WAKEUP_PIN3,PWR_WAKEUP_PIN4, PWR_WAKEUP_PIN5, PWR_WAKEUP_PIN6, PWR_WAKEUP_PIN7.PWR_WAKEUP_PIN8. or one of the following values where the user can explicitly states the enabled pin and the chosen polarity:
  - PWR_WAKEUP_PIN1_HIGH, PWR_WAKEUP_PIN1_LOW, PWR_WAKEUP_PIN2_HIGH, PWR_WAKEUP_PIN2_LOW, PWR_WAKEUP_PIN3_HIGH, PWR_WAKEUP_PIN3_LOW, PWR_WAKEUP_PIN4_HIGH, PWR_WAKEUP_PIN4_LOW, PWR_WAKEUP_PIN5_HIGH, PWR_WAKEUP_PIN5_LOW, PWR_WAKEUP_PIN6_HIGH, PWR_WAKEUP_PIN6_LOW, PWR_WAKEUP_PIN7_HIGH, PWR_WAKEUP_PIN7_LOW, PWR_WAKEUP_PIN8_HIGH, PWR_WAKEUP_PIN8_LOW.

Return values

- **None.:**

Notes

- PWR_WAKEUP_PINx and PWR_WAKEUP_PINx_HIGH are equivalent.
- The PWR_WAKEUP_PIN6_HIGH, PWR_WAKEUP_PIN6_LOW, PWR_WAKEUP_PIN7_HIGH, PWR_WAKEUP_PIN7_LOW, PWR_WAKEUP_PIN8_HIGH and PWR_WAKEUP_PIN8_LOW are not available for STM32H503xx devices.

HAL_PWR_DisableWakeUpPin

Function name

void HAL_PWR_DisableWakeUpPin (uint32_t WakeUpPinx)

Function description

Disable the WakeUp PINx functionality.

Parameters

- **WakeUpPinx:** : Specifies the Power Wake-Up pin to disable. This parameter can be one of the following values:
  - PWR_WAKEUP_PIN1, PWR_WAKEUP_PIN2, PWR_WAKEUP_PIN3,PWR_WAKEUP_PIN4, PWR_WAKEUP_PIN5, PWR_WAKEUP_PIN6, PWR_WAKEUP_PIN7.PWR_WAKEUP_PIN8. or one of the following values where the user can explicitly states the enabled pin and the chosen polarity:
  - PWR_WAKEUP_PIN1_HIGH, PWR_WAKEUP_PIN1_LOW, PWR_WAKEUP_PIN2_HIGH, PWR_WAKEUP_PIN2_LOW, PWR_WAKEUP_PIN3_HIGH, PWR_WAKEUP_PIN3_LOW, PWR_WAKEUP_PIN4_HIGH, PWR_WAKEUP_PIN4_LOW, PWR_WAKEUP_PIN5_HIGH, PWR_WAKEUP_PIN5_LOW, PWR_WAKEUP_PIN6_HIGH, PWR_WAKEUP_PIN6_LOW, PWR_WAKEUP_PIN7_HIGH, PWR_WAKEUP_PIN7_LOW, PWR_WAKEUP_PIN8_HIGH, PWR_WAKEUP_PIN8_LOW.

Return values

- **None.:**

Notes

- The PWR_WAKEUP_PIN6_HIGH, PWR_WAKEUP_PIN6_LOW, PWR_WAKEUP_PIN7_HIGH, PWR_WAKEUP_PIN7_LOW, PWR_WAKEUP_PIN8_HIGH and PWR_WAKEUP_PIN8_LOW are not available for STM32H503xx devices.

HAL_PWR_EnterSLEEPMode

Function name

void HAL_PWR_EnterSLEEPMode (uint32_t Regulator, uint8_t SLEEPEntry)

Function description

Enter the CPU in SLEEP mode.

Parameters

- **Regulator:** : Specifies the regulator state in Sleep mode. This parameter can be one of the following values :
  - PWR_MAINREGULATOR_ON
  - PWR_LOWPOWERREGULATOR_ON
- **SLEEPEntry:** : Specifies if SLEEP mode is entered with WFI or WFE instruction. This parameter can be one of the following values :
  - PWR_SLEEPENTRY_WFI enter SLEEP mode with Wait For Interrupt request.
  - PWR_SLEEPENTRY_WFE enter SLEEP mode with Wait For Event request.

Return values

- **None.:**

Notes

- In SLEEP mode, all I/O pins keep the same state as in Run mode.
- CPU clock is off and all peripherals including Cortex-M33 core such as NVIC and SysTick can run and wake up the CPU when an interrupt or an event occurs.
- This parameter is not available in this product. The parameter is kept just to maintain compatibility with other products.
- When WFI entry is used, ticks interrupt must be disabled to avoid unexpected CPU wake up.

HAL_PWR_EnterSTOPMode

Function name

void HAL_PWR_EnterSTOPMode (uint32_t Regulator, uint8_t STOPEntry)

Function description

Enter the whole system to STOP mode.

Parameters

- **Regulator:** : Specifies the regulator state in Sleep mode. This parameter can be one of the following values :
  - PWR_MAINREGULATOR_ON
  - PWR_LOWPOWERREGULATOR_ON
- **STOPEntry:** : Specifies if STOP mode is entered with WFI or WFE instruction. This parameter can be one of the following values :
  - PWR_STOPENTRY_WFI enter STOP mode with Wait For Interrupt request.
  - PWR_STOPENTRY_WFE enter STOP mode with Wait For Event request.

Return values

- **None.:**

Notes

- In STOP mode, the regulator remains in main regulator mode, allowing a very fast wakeup time but with much higher consumption comparing to other STOP modes.
- STOP offers the largest number of active peripherals and wakeup sources, a smaller wakeup time but a higher consumption. STOP mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the VCORE domain are stopped. The PLL, the HSI, the CSI and the HSE crystal oscillators are disabled. The LSE or LSI is still running.
- The system clock when exiting from Stop mode can be either HSI or CSI, depending on software configuration.
- This parameter is not available in this product. The parameter is kept just to maintain compatibility with other products.

HAL_PWR_EnterSTANDBYMode

Function name

void HAL_PWR_EnterSTANDBYMode (void)

Function description

Enter the whole system to STANDBY mode.

Return values

- **None.:**

Notes

- The STANDBY mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the VCORE domain is powered off. The PLL, the HSI, the CSI and the HSE crystal oscillators are also switched off.
- After entering STANDBY mode, SRAMs and register contents are lost except for registers and backup SRAM in the Backup domain and STANDBY circuitry.

HAL_PWR_EnableSleepOnExit

Function name

void HAL_PWR_EnableSleepOnExit (void)

Function description

Indicate SLEEP-ON-EXIT feature when returning from handler mode to thread mode.

Return values

- **None.:**

Notes

- Set SLEEPONEXIT bit of SCR register. When this bit is set, the processor re-enters SLEEP mode when an interruption handling is over. Setting this bit is useful when the processor is expected to run only on interruptions handling.

HAL_PWR_DisableSleepOnExit

Function name

void HAL_PWR_DisableSleepOnExit (void)

Function description

Disable SLEEP-ON-EXIT feature when returning from handler mode to thread mode.

Return values

- **None.:**

Notes

- Clears SLEEPONEXIT bit of SCR register. When this bit is set, the processor re-enters SLEEP mode when an interruption handling is over.

HAL_PWR_EnableSEVOnPend

Function name

void HAL_PWR_EnableSEVOnPend (void)

Function description

Enable CORTEX SEV-ON-PEND feature.

Return values

- **None.:**

Notes

- Sets SEVONPEND bit of SCR register. When this bit is set, any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry wakes up the Cortex-M33.

HAL_PWR_DisableSEVOnPend

Function name

void HAL_PWR_DisableSEVOnPend (void)

Function description

Disable CORTEX SEVONPEND feature.

Return values

- **None.:**

Notes

- Resets SEVONPEND bit of SCR register. When this bit is reset, only enabled pending causes exception entry wakes up the Cortex-M33.

HAL_PWR_PVD_IRQHandler

Function name

void HAL_PWR_PVD_IRQHandler (void)

Function description

This function handles the PWR PVD interrupt request.

Return values

- **None.:**

Notes

- This API should be called under the PVD_AVD_IRQHandler().
- The use of this API is only when we activate the PVD.
- When the PVD and AVD are activated at the same time you must use this API: HAL_PWREx_PVD_AVD_IRQHandler.

HAL_PWR_PVDCallback

Function name

void HAL_PWR_PVDCallback (void)

Function description

PWR PVD interrupt callback.

Return values

- **None.:**

HAL_PWR_ConfigAttributes

Function name

void HAL_PWR_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the PWR item attributes.

Parameters

- **Item:** : Specifies the item(s) to set attributes on. This parameter can be a combination of PWR Items.
- **Attributes:** : Specifies the available attribute(s). This parameter can be one of PWR Attributes.

Return values

- **None.:**

Notes

- Available attributes are security and privilege protection.
- Security attribute can only be set only by secure access.
- Privilege attribute for secure items can be managed only by a secure privileged access.
- Privilege attribute for nsecure items can be managed by a secure privileged access or by a nsecure privileged access.

HAL_PWR_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_PWR_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get attribute(s) of a PWR item.

Parameters

- **Item:** : Specifies the item(s) to set attributes on. This parameter can be one of PWR Items.
- **pAttributes:** : Pointer to return attribute(s). Returned value could be on of PWR Attributes.

Return values

- **HAL:** Status.

56.3 PWR Firmware driver defines

The following section lists the various define and macros of the module.

56.3.1 PWR

PWR

PWR Attributes

PWR_NSEC_PRIV

NSecure and Privileged attribute

PWR_NSEC_NPRIV

NSecure and NPrivileged attribute

PWR_SEC_PRIV

Secure and Privileged attribute

PWR_SEC_NPRIV

Secure and NPrivileged attribute

PWR Exported Macros

__HAL_PWR_GET_FLAG

Description:

- Check PWR flags are set or not.

Parameters:

- __FLAG__: : Specifies the flag to check. This parameter can be one of the following values :
  - PWR_FLAG_STOPF : Stop flag. Indicates that the device was resumed from Stop mode.
  - PWR_FLAG_SBF : Standby flag. Indicates that the device was resumed from Standby mode.
  - PWR_FLAG_VOSRDY : Voltage scaling ready flag. Indicates that the Vcore level at or above VOS selected level.
  - PWR_FLAG_ACTVOSRDY : Currently applied VOS ready flag. Indicates that Vcore is equal to the current voltage scaling provided by ACTVOS.
  - PWR_FLAG_BRR : Backup regulator ready flag. This bit is not reset when the device wakes up from STANDBY mode or by a system reset or power-on reset.
  - PWR_FLAG_VBATL : Backup domain voltage level flag (versus low threshold). Indicates the backup domain voltage level is equal or above low threshold.
  - PWR_FLAG_VBATH : Backup domain voltage level flag (versus high threshold). Indicates the backup domain voltage level is equal or above high threshold.
  - PWR_FLAG_TEMPL : Temperature level flag (versus low threshold). Indicates the temperature is equal or above low threshold.
  - PWR_FLAG_TEMPH : Temperature level flag (versus high threshold). Indicates the temperature is equal or above high threshold.
  - PWR_FLAG_AVDO : Regulator selection flag. Indicates the regulator selected.
  - PWR_FLAG_VDDIO2RDY : VDDIO2 ready flag (versus 0.9 V threshold). Indicates that VDDIO2 is equal or above the threshold of the VDDIO2 voltage monitor (around 0.9 V).
  - PWR_FLAG_PVDO : Voltage detector output flag. Indicates that Vdd is equal or above the PVD threshold selected by PVDLS.
  - PWR_FLAG_USB33RDY : VDDUSB ready flag (versus 1.2 V threshold). Indicates that VDDUSB is equal or above the threshold of the VDDUSB voltage monitor (around 1.2 V).
  - PWR_WAKEUP_FLAG1 : Wakeup flag 1. Indicates that a wakeup event was received from the WKUP line 1.
  - PWR_WAKEUP_FLAG2 : Wakeup flag 2. Indicates that a wakeup event was received from the WKUP line 2.
  - PWR_WAKEUP_FLAG3 : Wakeup flag 3. Indicates that a wakeup event was received from the WKUP line 3.
  - PWR_WAKEUP_FLAG4 : Wakeup flag 4. Indicates that a wakeup event was received from the WKUP line 4.
  - PWR_WAKEUP_FLAG5 : Wakeup flag 5. Indicates that a wakeup event was received from the WKUP line 5.
  - PWR_WAKEUP_FLAG6 : Wakeup flag 6. Indicates that a wakeup event was received from the WKUP line 6.
  - PWR_WAKEUP_FLAG7 : Wakeup flag 7. Indicates that a wakeup event was received from the WKUP line 7.
  - PWR_WAKEUP_FLAG8 : Wakeup flag 8. Indicates that a wakeup event was received from the WKUP line 8.

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

Notes:

- The PWR_WAKEUP_FLAG6, PWR_WAKEUP_FLAG7 AND PWR_WAKEUP_FLAG8 are not available for STM32H503xx devices.

__HAL_PWR_CLEAR_FLAG

Description:

- Clear PWR flags.

Parameters:

- __FLAG__: : Specifies the flag to clear. This parameter can be one of the following values :
  - PWR_FLAG_STOPF : STOP flag. Indicates that the device was resumed from STOP mode.
  - PWR_FLAG_SBF : STANDBY flag. Indicates that the device was resumed from STANDBY mode.
  - PWR_WAKEUP_FLAG1 : Wakeup flag 1. Indicates that a wakeup event was received from the WKUP line 1.
  - PWR_WAKEUP_FLAG2 : Wakeup flag 2. Indicates that a wakeup event was received from the WKUP line 2.
  - PWR_WAKEUP_FLAG3 : Wakeup flag 3. Indicates that a wakeup event was received from the WKUP line 3.
  - PWR_WAKEUP_FLAG4 : Wakeup flag 4. Indicates that a wakeup event was received from the WKUP line 4.
  - PWR_WAKEUP_FLAG5 : Wakeup flag 5. Indicates that a wakeup event was received from the WKUP line 5.
  - PWR_WAKEUP_FLAG6 : Wakeup flag 6. Indicates that a wakeup event was received from the WKUP line 6.
  - PWR_WAKEUP_FLAG7 : Wakeup flag 7. Indicates that a wakeup event was received from the WKUP line 7.
  - PWR_WAKEUP_FLAG8 : Wakeup flag 8. Indicates that a wakeup event was received from the WKUP line 8.

Return value:

- None.

Notes:

- The PWR_WAKEUP_FLAG6, PWR_WAKEUP_FLAG7 AND PWR_WAKEUP_FLAG8 are not available for STM32H503xx devices.

__HAL_PWR_PVD_EXTI_ENABLE_IT

Description:

- Enable the PVD Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_IT

Description:

- Disable the PVD Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_EVENT

Description:

- Enable the PVD Event Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_EVENT

Description:

- Disable the PVD Event Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the PVD Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_RISING_EDGE

Description:

- Disable the PVD Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_FALLING_EDGE

Description:

- Enable the PVD Extended Interrupt Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_FALLING_EDGE

Description:

- Disable the PVD Extended Interrupt Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the PVD Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the PVD Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_GENERATE_SWIT

Description:

- Generate a Software Interrupt on selected EXTI line.

Return value:

- None

__HAL_PWR_PVD_EXTI_GET_RISING_FLAG

Description:

- Check whether the specified PVD EXTI Rising interrupt flag is set or not.

Return value:

- EXTI: PVD Line Status.

__HAL_PWR_PVD_EXTI_GET_FALLING_FLAG

Description:

- Check whether the specified PVD EXTI Falling interrupt flag is set or not.

Return value:

- EXTI: PVD Line Status.

__HAL_PWR_PVD_EXTI_CLEAR_RISING_FLAG

Description:

- Clear the PVD EXTI Interrupt Rising flag.

Return value:

- None.

__HAL_PWR_PVD_EXTI_CLEAR_FALLING_FLAG

Description:

- Clear the PVD EXTI Interrupt Falling flag.

Return value:

- None.

__HAL_PWR_PVD_EXTI_CLEAR_FLAG

Description:

- Clear the PVD EXTI Interrupt flag.

Return value:

- None.

PWR Flags

PWR_FLAG_STOPF

STOP flag

PWR_FLAG_SBF

STANDBY flag

PWR_FLAG_VOSRDY

Voltage scaling ready flag

PWR_FLAG_ACTVOSRDY

Currently applied VOS ready flag

PWR_FLAG_BRR

Backup regulator ready flag

PWR_FLAG_VBATL

Backup domain voltage level flag (versus low threshold)

PWR_FLAG_VBATH

Backup domain voltage level flag (versus high threshold)

PWR_FLAG_TEMPL

Temperature level flag (versus low threshold)

PWR_FLAG_TEMPH

Temperature level flag (versus high threshold)

PWR_FLAG_AVDO

VDDA voltage detector output flag

PWR_FLAG_VDDIO2RDY

VDDIO2 voltage detector output flag

PWR_FLAG_PVDO

VDD voltage detector output flag

PWR_FLAG_USB33RDY

VDDUSB33 ready flag

PWR_WAKEUP_FLAG1

Wake up line 1 flag

PWR_WAKEUP_FLAG2

Wake up line 2 flag

PWR_WAKEUP_FLAG3

Wake up line 3 flag

PWR_WAKEUP_FLAG4

Wake up line 4 flag

PWR_WAKEUP_FLAG5

Wake up line 5 flag

PWR_WAKEUP_FLAG6

Wake up line 6 flag

PWR_WAKEUP_FLAG7

Wake up line 7 flag

PWR_WAKEUP_FLAG8

Wake up line 8 flag

PWR_WAKEUP_ALL_FLAG

Wakeup flag all

PWR Items

WUP7 secure protection

PWR_WKUP8

WUP8 secure protection

PWR_RET

IO Retention secure protection

PWR_LPM

Low power modes secure protection

PWR_SCM

Voltage detection and monitoring secure protection

PWR_VB

Backup domain secure protection

PWR_VUSB

Voltage USB secure protection

PWR_ALL

Programmable Voltage Detection Level

PWR_PVDLEVEL_0

PVD threshold around 1.95 V

PWR_PVDLEVEL_1

PVD threshold around 2.1 V

PWR_PVDLEVEL_2

PVD threshold around 2.25 V

PWR_PVDLEVEL_3

PVD threshold around 2.4 V

PWR_PVDLEVEL_4

PVD threshold around 2.55 V

PWR_PVDLEVEL_5

PVD threshold around 2.7 V

PWR_PVDLEVEL_6

PVD threshold around 2.85 V

PWR_PVDLEVEL_7

External input analog voltage (compared internally to VREFINT)

PWR PVD Mode

PWR_PVD_MODE_NORMAL

Basic Mode is used

PWR_PVD_MODE_IT_RISING

External Interrupt Mode with Rising edge trigger detection

PWR_PVD_MODE_IT_FALLING

External Interrupt Mode with Falling edge trigger detection

PWR_PVD_MODE_IT_RISING_FALLING

External Interrupt Mode with Rising/Falling edge trigger detection

PWR_PVD_MODE_EVENT_RISING

Event Mode with Rising edge trigger detection

PWR_PVD_MODE_EVENT_FALLING

Event Mode with Falling edge trigger detection

PWR_PVD_MODE_EVENT_RISING_FALLING

Event Mode with Rising/Falling edge trigger detection

PWR PVD Mode Mask

PVD_RISING_EDGE

Mask for rising edge set as PVD trigger

PVD_FALLING_EDGE

Mask for falling edge set as PVD trigger

PVD_MODE_IT

Mask for interruption yielded by PVD threshold crossing

PVD_MODE_EVT

Mask for event yielded by PVD threshold crossing

PWR PVM Mode Mask

PVM_RISING_EDGE

Mask for rising edge set as PVM trigger

PVM_FALLING_EDGE

Mask for falling edge set as PVM trigger

PVM_MODE_IT

Mask for interruption yielded by PVM threshold crossing

PVM_MODE_EVT

Mask for event yielded by PVM threshold crossing

PWR Regulator State in SLEEP/STOP Mode

PWR_MAINREGULATOR_ON

Main Regulator ON in Run Mode

PWR_LOWPOWERREGULATOR_ON

Main Regulator ON in Low Power Mode

PWR SLEEP Mode Entry

PWR_SLEEPENTRY_WFI

Wait For Interruption instruction to enter Sleep mode

PWR_SLEEPENTRY_WFE

Wait For Event instruction to enter Sleep mode

PWR STOP Mode Entry

PWR_STOPENTRY_WFI

Wait For Interruption instruction to enter Stop mode

PWR_STOPENTRY_WFE

Wait For Event instruction to enter Stop mode

57 HAL PWR Extension Driver

57.1 PWREx Firmware driver registers structures

57.1.1 PWREx_AVDTypeDef

PWREx_AVDTypeDef is defined in the stm32h5xx_hal_pwr_ex.h

Data Fields

- ***uint32_t AVDLevel***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t PWREx_AVDTypeDef::AVDLevel***
  AVDLevel: Specifies the AVD detection level. This parameter can be a value of ***PWREx_AVD_detection_level***
- ***uint32_t PWREx_AVDTypeDef::Mode***
  Mode: Specifies the EXTI operating mode for the AVD event. This parameter can be a value of ***PWREx_AVD_Mode***.

57.1.2 PWREx_WakeupPinTypeDef

PWREx_WakeupPinTypeDef is defined in the stm32h5xx_hal_pwr_ex.h

Data Fields

- ***uint32_t WakeUpPin***
- ***uint32_t PinPolarity***
- ***uint32_t PinPull***

Field Documentation

- ***uint32_t PWREx_WakeupPinTypeDef::WakeUpPin***
  WakeUpPin: Specifies the Wake-Up pin to be enabled. This parameter can be a value of ***PWREx_WakeUp_Pins***
- ***uint32_t PWREx_WakeupPinTypeDef::PinPolarity***
  PinPolarity: Specifies the Wake-Up pin polarity. This parameter can be a value of ***PWREx_PIN_Polarity***
- ***uint32_t PWREx_WakeupPinTypeDef::PinPull***
  PinPull: Specifies the Wake-Up pin pull. This parameter can be a value of ***PWREx_PIN_Pull***

57.2 PWREx Firmware driver API description

The following section lists the various functions of the PWREx library.

57.2.1 Power supply control functions

This section contains the following APIs:

- ***HAL_PWREx_ConfigSupply()***
- ***HAL_PWREx_GetSupplyConfig()***
- ***HAL_PWREx_ControlVoltageScaling()***
- ***HAL_PWREx_GetVoltageRange()***
- ***HAL_PWREx_ControlStopModeVoltageScaling()***
- ***HAL_PWREx_GetStopModeVoltageRange()***

57.2.2 Voltage Monitoring Functions

This section contains the following APIs:

- ***HAL_PWREx_ConfigAVD()***
- ***HAL_PWREx_EnableAVD()***
- ***HAL_PWREx_DisableAVD()***

- *HAL_PWREx_EnableUSBVoltageDetector()*
- *HAL_PWREx_DisableUSBVoltageDetector()*
- *HAL_PWREx_EnableVddUSB()*
- *HAL_PWREx_DisableVddUSB()*
- *HAL_PWREx_EnableMonitoring()*
- *HAL_PWREx_DisableMonitoring()*
- *HAL_PWREx_EnableUCPDStandbyMode()*
- *HAL_PWREx_DisableUCPDStandbyMode()*
- *HAL_PWREx_EnableUCPDDeadBattery()*
- *HAL_PWREx_DisableUCPDDeadBattery()*
- *HAL_PWREx_EnableBatteryCharging()*
- *HAL_PWREx_DisableBatteryCharging()*
- *HAL_PWREx_EnableAnalogBooster()*
- *HAL_PWREx_DisableAnalogBooster()*
- *HAL_PWREx_PVD_AVD_IRQHandler()*
- *HAL_PWREx_PVD_AVD_Rising_Callback()*
- *HAL_PWREx_PVD_AVD_Falling_Callback()*

57.2.3 Wakeup Pins configuration Functions

This section contains the following APIs:

- *HAL_PWREx_EnableWakeUpPin()*
- *HAL_PWREx_DisableWakeUpPin()*

57.2.4 Memories Retention Functions

This section contains the following APIs:

- *HAL_PWREx_EnableFlashPowerDown()*
- *HAL_PWREx_DisableFlashPowerDown()*
- *HAL_PWREx_EnableMemoryShutOff()*
- *HAL_PWREx_DisableMemoryShutOff()*
- *HAL_PWREx_EnableBkupRAMRetention()*
- *HAL_PWREx_DisableBkupRAMRetention()*

57.2.5 IO and JTAG Retention Functions

In the Standby mode, the I/Os are by default in floating state. If the IORETEN bit in the PWR_IORETR register is set, the I/Os output state is retained. IO Retention mode is enabled for all IO except the IO support the standby functionality and JTAG IOs (PA13, PA14, PA15 and PB4). When entering into Standby mode, the state of the output is sampled, and pull-up or pull-down resistor are set to maintain the IO output during Standby mode. If the JTAGIORETEN bit in the PWR_IORETR register is set, the I/Os output state is retained. IO Retention mode is enabled for PA13, PA14, PA15 and PB4 (default JTAG pullup/ pull-down after wakeup are not enabled).

This section contains the following APIs:

- *HAL_PWREx_EnableStandbyIORetention()*
- *HAL_PWREx_DisableStandbyIORetention()*
- *HAL_PWREx_EnableStandbyJTAGIORetention()*
- *HAL_PWREx_DisableStandbyJTAGIORetention()*

57.2.6 Detailed description of functions

HAL_PWREx_ConfigSupply

Function name

HAL_StatusTypeDef HAL_PWREx_ConfigSupply (uint32_t SupplySource)

Function description

Configure the system Power Supply.

Parameters

- **SupplySource:** : Specifies the Power Supply source to set after a system startup. This parameter can be one of the following values :
  - PWR_EXTERNAL_SOURCE_SUPPLY : The SMPS and the LDO are Bypassed. The Vcore Power Domains are supplied from external source.

Return values

- **HAL:** status.

HAL_PWREx_GetSupplyConfig

Function name

uint32_t HAL_PWREx_GetSupplyConfig (void)

Function description

Get the power supply configuration.

Return values

- **The:** supply configuration.

HAL_PWREx_ControlVoltageScaling

Function name

HAL_StatusTypeDef HAL_PWREx_ControlVoltageScaling (uint32_t VoltageScaling)

Function description

Configure the main internal regulator output voltage.

Parameters

- **VoltageScaling:** : Specifies the regulator output voltage to achieve a tradeoff between performance and power consumption. This parameter can be one of the following values :
  - PWR_REGULATOR_VOLTAGE_SCALE0 : Regulator voltage output Scale 0 mode.
  - PWR_REGULATOR_VOLTAGE_SCALE1 : Regulator voltage output range 1 mode.
  - PWR_REGULATOR_VOLTAGE_SCALE2 : Regulator voltage output range 2 mode.
  - PWR_REGULATOR_VOLTAGE_SCALE3 : Regulator voltage output range 3 mode.

Return values

- **HAL:** Status

HAL_PWREx_GetVoltageRange

Function name

uint32_t HAL_PWREx_GetVoltageRange (void)

Function description

Get the main internal regulator output voltage.

Return values

- **The:** current applied VOS selection.

HAL_PWREx_ControlStopModeVoltageScaling

Function name

HAL_StatusTypeDef HAL_PWREx_ControlStopModeVoltageScaling (uint32_t VoltageScaling)

Function description

Configure the main internal regulator output voltage in STOP mode.

Parameters

- **VoltageScaling:** : Specifies the regulator output voltage when the system enters Stop mode to achieve a tradeoff between performance and power consumption. This parameter can be one of the following values:
  - PWR_REGULATOR_SVOS_SCALE3 : Regulator voltage output range 3 mode.
  - PWR_REGULATOR_SVOS_SCALE4 : Regulator voltage output range 4 mode.
  - PWR_REGULATOR_SVOS_SCALE5 : Regulator voltage output range 5 mode.

Return values

- **HAL:** Status.

Notes

- The Stop mode voltage scaling for SVOS4 and SVOS5 sets the voltage regulator in Low-power (LP) mode to further reduce power consumption. When preselecting SVOS3, the use of the voltage regulator low-power mode (LP) can be selected by LPDS register bit.
- The selected SVOS4 and SVOS5 levels add an additional startup delay when exiting from system Stop mode.

HAL_PWREx_GetStopModeVoltageRange

Function name

uint32_t HAL_PWREx_GetStopModeVoltageRange (void)

Function description

Get the main internal regulator output voltage in STOP mode.

Return values

- **The:** actual applied VOS selection.

HAL_PWREx_ConfigAVD

Function name

void HAL_PWREx_ConfigAVD (const PWREx_AVDTypeDef * sConfigAVD)

Function description

Configure the event mode and the voltage threshold detected by the Analog Voltage Detector (AVD).

Parameters

- **sConfigAVD:** : Pointer to an PWREx_AVDTypeDef structure that contains the configuration information for the AVD.

Return values

- **None.:**

Notes

- Refer to the electrical characteristics of your device datasheet for more details about the voltage threshold corresponding to each detection level.

HAL_PWREx_EnableAVD

Function name

void HAL_PWREx_EnableAVD (void)

Function description

Enable the Analog Voltage Detector (AVD).

Return values

- **None.:**

HAL_PWREx_DisableAVD

Function name

void HAL_PWREx_DisableAVD (void)

Function description

Disable the Analog Voltage Detector(AVD).

Return values

- **None.:**

HAL_PWREx_EnableUSBVoltageDetector

Function name

void HAL_PWREx_EnableUSBVoltageDetector (void)

Function description

Enable the USB voltage level detector.

Return values

- **None.:**

HAL_PWREx_DisableUSBVoltageDetector

Function name

void HAL_PWREx_DisableUSBVoltageDetector (void)

Function description

Disable the USB voltage level detector.

Return values

- **None.:**

HAL_PWREx_EnableVddUSB

Function name

void HAL_PWREx_EnableVddUSB (void)

Function description

Enable VDDUSB supply.

Return values

- **None.:**

Notes

- Remove VDDUSB electrical and logical isolation, once VDDUSB supply is present for consumption saving.

HAL_PWREx_DisableVddUSB

Function name

void HAL_PWREx_DisableVddUSB (void)

Function description

Disable VDDUSB supply.

Return values

- **None.:**

HAL_PWREx_EnableMonitoring

Function name

void HAL_PWREx_EnableMonitoring (void)

Function description

Enable the VBAT and temperature monitoring.

Return values

- **None.:**

HAL_PWREx_DisableMonitoring

Function name

void HAL_PWREx_DisableMonitoring (void)

Function description

Disable the VBAT and temperature monitoring.

Return values

- **None.:**

HAL_PWREx_EnableUCPDStandbyMode

Function name

void HAL_PWREx_EnableUCPDStandbyMode (void)

Function description

Enable UCPD configuration memorization in Standby mode.

Return values

- **None.:**

HAL_PWREx_DisableUCPDStandbyMode

Function name

void HAL_PWREx_DisableUCPDStandbyMode (void)

Function description

Disable UCPD configuration memorization in Standby mode.

Return values

- **None.:**

Notes

- This function must be called on exiting the Standby mode and before any UCPD configuration update.

HAL_PWREx_EnableUCPDDeadBattery

Function name

void HAL_PWREx_EnableUCPDDeadBattery (void)

Function description

Enable dead battery behavior.

Return values

- **None.:**

Notes

- After exiting reset, the USB Type-C (dead battery) behavior is enabled, which may have a pull-down effect on CC1 and CC2 pins. It is recommended to disable it in all cases, either to stop this pull-down or to handover control to the UCPD (the UCPD must be initialized before doing the disable).

HAL_PWREx_DisableUCPDDeadBattery

Function name

void HAL_PWREx_DisableUCPDDeadBattery (void)

Function description

Disable dead battery behavior.

Return values

- **None.:**

Notes

- After exiting reset, the USB Type-C (dead battery) behavior is enabled, which may have a pull-down effect on CC1 and CC2 pins. It is recommended to disable it in all cases, either to stop this pull-down or to handover control to the UCPD (the UCPD must be initialized before doing the disable).

HAL_PWREx_EnableBatteryCharging

Function name

void HAL_PWREx_EnableBatteryCharging (uint32_t ResistorValue)

Function description

Enable the Battery charging.

Parameters

- **ResistorValue:** : Specifies the charging resistor. This parameter can be one of the following values :
  - PWR_BATTERY_CHARGING_RESISTOR_5 : 5 KOhm resistor.
  - PWR_BATTERY_CHARGING_RESISTOR_1_5 : 1.5 KOhm resistor.

Return values

- **None.:**

Notes

- When VDD is present, charge the external battery through an internal resistor.

HAL_PWREx_DisableBatteryCharging

Function name

void HAL_PWREx_DisableBatteryCharging (void)

Function description

Disable the Battery charging.

Return values

- **None.:**

HAL_PWREx_EnableAnalogBooster

Function name

void HAL_PWREx_EnableAnalogBooster (void)

Function description

Enable the booster to guarantee the analog switch AC performance when the VDD supply voltage is below 2V7.

Return values

- **None.:**

Notes

- The VDD supply voltage can be monitored through the PVD and the PLS field bits.

HAL_PWREx_DisableAnalogBooster

Function name

void HAL_PWREx_DisableAnalogBooster (void)

Function description

Disable the analog booster.

Return values

- **None.:**

HAL_PWREx_PVD_AVD_IRQHandler

Function name

void HAL_PWREx_PVD_AVD_IRQHandler (void)

Function description

This function handles the PWR PVD/AVD interrupt request.

Return values

- **None:**

Notes

- This API should be called under the PVD_AVD_IRQHandler().
- The use of this API is when the PVD and AVD are activated at the same time.

HAL_PWREx_PVD_AVD_Rising_Callback

Function name

void HAL_PWREx_PVD_AVD_Rising_Callback (void)

Function description

PWR PVD AVD Rising interrupt callback.

Return values

- **None.:**

HAL_PWREx_PVD_AVD_Falling_Callback

Function name

void HAL_PWREx_PVD_AVD_Falling_Callback (void)

Function description

PWR PVD AVD Falling interrupt callback.

Return values

- **None.:**

HAL_PWREx_EnableWakeUpPin

Function name

void HAL_PWREx_EnableWakeUpPin (const PWREx_WakeupPinTypeDef * sPinParams)

Function description

Enable the Wake-up PINx functionality.

Parameters

- **sPinParams:** : Pointer to a PWREx_WakeupPinTypeDef structure that contains the configuration information for the wake-up Pin.

Return values

- **None.:**

HAL_PWREx_DisableWakeUpPin

Function name

void HAL_PWREx_DisableWakeUpPin (uint32_t WakeUpPinx)

Function description

Disable the Wake-up PINx functionality.

Parameters

- **WakeUpPinx:** : Specifies the Wake-Up pin to be disabled. This parameter can be one of the following values:
  - PWR_WAKEUP_PIN1
  - PWR_WAKEUP_PIN2
  - PWR_WAKEUP_PIN3
  - PWR_WAKEUP_PIN4
  - PWR_WAKEUP_PIN5
  - PWR_WAKEUP_PIN6
  - PWR_WAKEUP_PIN7
  - PWR_WAKEUP_PIN8

Return values

- **None:**

Notes

- The PWR_WAKEUP_PIN6, PWR_WAKEUP_PIN7 and PWR_WAKEUP_PIN8 are not available for STM32H503xx devices.

HAL_PWREx_EnableFlashPowerDown

Function name

void HAL_PWREx_EnableFlashPowerDown (void)

Function description

Enable the Flash Power Down in Stop mode.

Return values

- **None.:**

Notes

- When Flash Power Down is enabled the Flash memory enters low-power mode. This feature allows to obtain the best trade-off between low-power consumption and restart time when exiting from Stop mode.

HAL_PWREx_DisableFlashPowerDown

Function name

void HAL_PWREx_DisableFlashPowerDown (void)

Function description

Disable the Flash Power Down in Stop mode.

Return values

- **None.:**

Notes

- When Flash Power Down is disabled the Flash memory is kept on normal mode. This feature allows to obtain the best trade-off between low-power consumption and restart time when exiting from Stop mode.

HAL_PWREx_EnableMemoryShutOff

Function name

void HAL_PWREx_EnableMemoryShutOff (uint32_t MemoryBlock)

Function description

Enable memory block shut-off in Stop mode.

Parameters

- **MemoryBlock:** : Specifies the memory block to shut-off during Stop mode. This parameter can be one of the following values:
  - PWR_ETHERNET_MEMORY_BLOCK PWR_PMCR_ETHERNETSO : Ethernet shut-off control in Stop mode
  - PWR_RAM3_MEMORY_BLOCK PWR_PMCR_SRAM3SO : RAM3 shut-off control in Stop mode
  - PWR_RAM2_16_MEMORY_BLOCK PWR_PMCR_SRAM2_16SO : RAM2 16k byte shut-off control in Stop mode
  - PWR_RAM2_48_MEMORY_BLOCK PWR_PMCR_SRAM2_48SO : RAM2 48k byte shut-off control in Stop mode
  - PWR_RAM1_MEMORY_BLOCK PWR_PMCR_SRAM1SO : RAM1 shut-off control in Stop mode

Return values

- **None.:**

Notes

- In Stop mode, the content of the memory blocks is maintained. Further power optimization can be obtained by switching off some memory blocks. This optimization implies loss of the memory content. The user can select which memory is discarded during STOP mode by means of xxSO bits.
- The PWR_ETHERNET_MEMORY_BLOCK is not available for STM32H503xx devices.

HAL_PWREx_DisableMemoryShutOff

Function name

void HAL_PWREx_DisableMemoryShutOff (uint32_t MemoryBlock)

Function description

Disable memory block shut-off in Stop mode.

Parameters

- **MemoryBlock:** : Specifies the memory block to keep content during Stop mode. This parameter can be one of the following values:
  - PWR_ETHERNET_MEMORY_BLOCK PWR_PMCR_ETHERNETSO : Ethernet shut-off control in Stop mode
  - PWR_RAM3_MEMORY_BLOCK PWR_PMCR_SRAM3SO : RAM3 shut-off control in Stop mode
  - PWR_RAM2_16_MEMORY_BLOCK PWR_PMCR_SRAM2_16SO : RAM2 16k byte shut-off control in Stop mode
  - PWR_RAM2_48_MEMORY_BLOCK PWR_PMCR_SRAM2_48SO : RAM2 48k byte shut-off control in Stop mode
  - PWR_RAM1_MEMORY_BLOCK PWR_PMCR_SRAM1SO : RAM1 shut-off control in Stop mode

Return values

- **None.:**

Notes

- The PWR_ETHERNET_MEMORY_BLOCK is not available for STM32H503xx devices.

HAL_PWREx_EnableBkupRAMRetention

Function name

HAL_StatusTypeDef HAL_PWREx_EnableBkupRAMRetention (void)

Function description

Enable the Backup RAM retention in Standby and VBAT modes.

Return values

- **None.:**

Notes

- If BREN is reset, the backup RAM can still be used in Run, Sleep and Stop modes. However, its content is lost in Standby, Shutdown and VBAT modes. This bit can be writte

HAL_PWREx_DisableBkupRAMRetention

Function name

void HAL_PWREx_DisableBkupRAMRetention (void)

Function description

Disable the Backup RAM retention in Standby and VBAT modes.

Return values

- **None.:**

Notes

- If BREN is reset, the backup RAM can still be used in Run, Sleep and Stop modes. However, its content is lost in Standby, Shutdown and VBAT modes. This bit can be write

HAL_PWREx_EnableStandbyIORetention

Function name

void HAL_PWREx_EnableStandbyIORetention (void)

Function description

Enable GPIO state retention in Standby mode.

Return values

- **None.:**

Notes

- When entering into standby mode, the output is sampled, and applied to the output IO during the standby power mode

HAL_PWREx_DisableStandbyIORetention

Function name

void HAL_PWREx_DisableStandbyIORetention (void)

Function description

Disable GPIO state retention in Standby mode.

Return values

- **None.:**

HAL_PWREx_EnableStandbyJTAGIORetention

Function name

void HAL_PWREx_EnableStandbyJTAGIORetention (void)

Function description

Enable JTAG IOs state retention in Standby mode.

Return values

- **None.:**

Notes

- when entering into standby mode, the output is sampled, and applied to the output IO during the standby power mode

HAL_PWREx_DisableStandbyJTAGIORetention

Function name

void HAL_PWREx_DisableStandbyJTAGIORetention (void)

Function description

Disable JTAG IOs state retention in Standby mode.

Return values

- **None.:**

57.3 PWREx Firmware driver defines

The following section lists the various define and macros of the module.

57.3.1 PWREx

PWREx

PWREx AVD detection level

PWR_AVDLEVEL_0

Analog voltage detector level 0 selection : 1V7

PWR_AVDLEVEL_1

Analog voltage detector level 1 selection : 2V1

PWR_AVDLEVEL_2

Analog voltage detector level 2 selection : 2V5

PWR_AVDLEVEL_3

Analog voltage detector level 3 selection : 2V8

PWREx AVD EXTI Line 16

PWR_EXTI_LINE_AVD

External interrupt line 16 Connected to the AVD EXTI Line

PWREx AVD Mode

PWR_AVD_MODE_NORMAL

Basic mode is used

PWR_AVD_MODE_IT_RISING

External Interrupt Mode with Rising edge trigger detection

PWR_AVD_MODE_IT_FALLING

External Interrupt Mode with Falling edge trigger detection

PWR_AVD_MODE_IT_RISING_FALLING

External Interrupt Mode with Rising/Falling edge trigger detection

PWR_AVD_MODE_EVENT_RISING

Event Mode with Rising edge trigger detection

PWR_AVD_MODE_EVENT_FALLING

Event Mode with Falling edge trigger detection

PWR_AVD_MODE_EVENT_RISING_FALLING

Event Mode with Rising/Falling edge trigger detection

PWR Extended AVD Mode Mask

AVD_MODE_IT

AVD_MODE_EVT

AVD_RISING_EDGE

AVD_FALLING_EDGE

AVD_RISING_FALLING_EDGE

PWR Extended Exported Macros

__HAL_PWR_AVD_EXTI_ENABLE_IT

Description:

- Enable the AVD EXTI Line 16.

Return value:

- None.

__HAL_PWR_AVD_EXTI_DISABLE_IT

Description:

- Disable the AVD EXTI Line 16.

Return value:

- None.

__HAL_PWR_AVD_EXTI_ENABLE_EVENT

Description:

- Enable event on AVD EXTI Line 16.

Return value:

- None.

__HAL_PWR_AVD_EXTI_DISABLE_EVENT

Description:

- Disable event on AVD EXTI Line 16.

Return value:

- None.

__HAL_PWR_AVD_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the AVD Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_AVD_EXTI_DISABLE_RISING_EDGE

Description:

- Disable the AVD Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_AVD_EXTI_ENABLE_FALLING_EDGE

Description:

- Enable the AVD Extended Interrupt Falling Trigger.

Return value:

- None.

__HAL_PWR_AVD_EXTI_DISABLE_FALLING_EDGE

Description:

- Disable the AVD Extended Interrupt Falling Trigger.

Return value:

- None.

__HAL_PWR_AVD_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the AVD Extended Interrupt Rising and Falling Trigger.

Return value:

- None.

__HAL_PWR_AVD_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the AVD Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_AVD_EXTI_GET_RISING_FLAG

Description:

- Check whether the specified AVD EXTI Rising interrupt flag is set or not.

Return value:

- EXTI: AVD Line Status.

__HAL_PWR_PVD_AVD_EXTI_GET_FALLING_FLAG

Description:

- Check whether the specified AVD EXTI Falling interrupt flag is set or not.

Return value:

- EXTI: AVD Line Status.

__HAL_PWR_PVD_AVD_EXTI_CLEAR_FLAG

Description:

- Clear the AVD EXTI flag.

Return value:

- None.

__HAL_PWR_AVD_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on AVD EXTI line.

Return value:

- None.

__HAL_PWR_VOLTAGESCALING_CONFIG

Description:

- Configure the main internal regulator output voltage.

Parameters:

- __REGULATOR__: : Specifies the regulator output voltage to achieve a tradeoff between performance and power consumption. This parameter can be one of the following values :
  - PWR_REGULATOR_VOLTAGE_SCALE0 : Regulator voltage output scale 0. Provides a typical output voltage at 1.2 V. Used when system clock frequency is up to 160 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE1 : Regulator voltage output scale 1. Provides a typical output voltage at 1.1 V. Used when system clock frequency is up to 100 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE2 : Regulator voltage output scale 2. Provides a typical output voltage at 1.0 V. Used when system clock frequency is up to 50 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE3 : Regulator voltage output scale 3. Provides a typical output voltage at 0.9 V. Used when system clock frequency is up to 24 MHz.

Return value:

- None.

Notes:

- This macro is similar to HAL_PWREx_ControlVoltageScaling() API but doesn't check whether or not VOSREADY flag is set. User may resort to __HAL_PWR_GET_FLAG() macro to check VOSF bit state.

58.2 RAMCFG Firmware driver API description

The following section lists the various functions of the RAMCFG library.

58.2.1 RAMCFG Peripheral features

- Each SRAM is managed by a RAMCFG instance.
- Each SRAM can be erased independently through its RAMCFG instance.
- The wait state value for each SRAM can be configured independently through its RAMCFG instance.
- SRAM2 is divided to 64 pages with 1 kB granularity. Each page can be write protected independently through its RAMCFG instance.
- SRAM2, SRAM3 and BKPRAM support ECC correction feature. This mechanism adopts the Single Error Correction Double Error Detection (SECDED) algorithm. This feature provides the following information:
  - Single error address.
  - Double error address.

  ==========

58.2.2 How to use this driver

1. Call HAL_RAMCFG_Init() to initialize the RAMCFG peripheral before using any feature. Call HAL_RAMCFG_DeInit() to de-initialize the RAMCFG when using this peripheral is no more needed or a hardware issue has occurred. (+) HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

(#) Call HAL_RAMCFG_Init() to initialize the RAMCFG peripheral before using any feature. Call HAL_RAMCFG_DeInit() to de-initialize the RAMCFG when using this peripheral is no more needed or a hardware issue has occurred.

- HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

ECC feature

- Call HAL_RAMCFG_StartECC() and HAL_RAMCFG_StopECC() to enable and disable ECC hardware mechanism.
  - When ECC feature is previously enabled (case of option byte activation), calling HAL_RAMCFG_StartECC() is recommended to enable the ECC address latching feature.
- Call HAL_RAMCFG_EnableNotification() and HAL_RAMCFG_DisableNotification() to enable and disable ECC interrupts. Interrupts can be:
  - Single error interrupt.
  - Double error interrupt.
  - Double error interrupt redirected to Non maskable interrupt (NMI).
- Call HAL_RAMCFG_GetSingleErrorAddress() to get the address of the last fail RAM word detected (only for single error) and call HAL_RAMCFG_GetDoubleErrorAddress() to get the address of the last fail RAM word detected (only for double error).
- Call HAL_RAMCFG_IsECCErrorDetected() to check if an ECC single/double error was detected. This API is used in silent mode (No ECC interrupt is enabled).

Write protection feature

- Call HAL_RAMCFG_EnableWriteProtection() to enable the write protection for the given SRAM2 page(s).
- There is no API to disable write protection as this feature can be disabled only by a global peripheral reset or system reset.
- Any write access to a write protected area of SRAM2 causes a HardFault interrupt.

Erase feature

- Call HAL_RAMCFG_Erase() to launch a hardware erase for the given SRAM.
- The erase value is equal to 0 when launching erase hardware through RAMCFG.
- SRAM2 write protected pages are erased when performing an erase through RAMCFG.

RAMCFG HAL driver macros list

Below the list of used macros in RAMCFG HAL driver.

- __HAL_RAMCFG_ENABLE_IT : Enable the specified RAMCFG interrupts.
- __HAL_RAMCFG_DISABLE_IT : Disable the specified RAMCFG interrupts.
- __HAL_RAMCFG_GET_FLAG : Get the RAMCFG pending flags.
- __HAL_RAMCFG_CLEAR_FLAG : Clear the RAMCFG pending flags.
- __HAL_RAMCFG_GET_IT_SOURCE : Check whether the specified RAMCFG interrupt source is enabled or not.

58.2.3 Initialization and de-initialization Functions

This section provides functions allowing to initialize and de-initialize the RAMCFG instance.

The HAL_RAMCFG_Init() function follows the RAMCFG instance configuration procedures as described in the reference manual. The HAL_RAMCFG_DeInit() function allows to deinitialize the RAMCFG instance. HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

This section contains the following APIs:

- *HAL_RAMCFG_Init()*
- *HAL_RAMCFG_DeInit()*
- *HAL_RAMCFG_MspInit()*
- *HAL_RAMCFG_MspDeInit()*

58.2.4 ECC Operations Functions

This section provides functions allowing to manage ECC feature provided by the RAMCFG peripheral.

The HAL_RAMCFG_StartECC() function allows starting the ECC mechanism and enabling ECC address latching for the selected RAMCFG instance. The HAL_RAMCFG_StopECC() function allows stopping the ECC mechanism and disabling ECC address latching for the selected RAMCFG instance. The HAL_RAMCFG_EnableNotification() function allows enabling interrupts for single ECC error, double ECC error and NMI error. The HAL_RAMCFG_DisableNotification() function allows disabling interrupts for single ECC error, double ECC error. When NMI interrupt is enabled it can only be disabled by a global peripheral reset or by a system reset. The HAL_RAMCFG_IsECCErrorDetected() function allows to check if an ECC error has occurred. The HAL_RAMCFG_GetSingleErrorAddress() function allows to get the address of the last single ECC error detected. The HAL_RAMCFG_GetDoubleErrorAddress() function allows to get the address of the last double ECC error detected.

This section contains the following APIs:

- *HAL_RAMCFG_StartECC()*
- *HAL_RAMCFG_StopECC()*
- *HAL_RAMCFG_EnableNotification()*
- *HAL_RAMCFG_DisableNotification()*
- *HAL_RAMCFG_IsECCSingleErrorDetected()*
- *HAL_RAMCFG_IsECCDoubleErrorDetected()*
- *HAL_RAMCFG_GetSingleErrorAddress()*
- *HAL_RAMCFG_GetDoubleErrorAddress()*

58.2.5 Write Protection Functions

This section provides functions to enable write protection feature for the page(s) of SRAM2.

The HAL_RAMCFG_EnableWriteProtection() function allows the user to enable the write protection for the page(s) of SRAM2. Disabling SRAM2 page(s) protection is performed only by a global peripheral reset or a by a system reset.

This section contains the following APIs:

- *HAL_RAMCFG_EnableWriteProtection()*

58.2.6 Erase Operation Functions

This section provides functions allowing a hardware erase for the given SRAM.

The HAL_RAMCFG_Erase() function allows a hardware mass erase for the given SRAM. The erase value for all SRAMs is 0.

This section contains the following APIs:

- *HAL_RAMCFG_Erase()*

58.2.7 Handle Interrupt and Callbacks Functions

This section provides functions to handle RAMCFG interrupts and Register / UnRegister the different callbacks.

The HAL_RAMCFG_IRQHandler() function allows the user to handle the active RAMCFG interrupt request. The HAL_RAMCFG_RegisterCallback() function allows the user to register the selected RAMCFG callbacks. The HAL_RAMCFG_UnRegisterCallback() function allows the user to unregister the selected RAMCFG callbacks.

This section contains the following APIs:

- *HAL_RAMCFG_IRQHandler()*
- *HAL_RAMCFG_DetectSingleErrorCallback()*
- *HAL_RAMCFG_DetectDoubleErrorCallback()*
- *HAL_RAMCFG_RegisterCallback()*
- *HAL_RAMCFG_UnRegisterCallback()*

58.2.8 State and Error Functions

This section provides functions to check and get the RAMCFG state and the error code.

The HAL_RAMCFG_GetState() function allows the user to get the RAMCFG peripheral state. The HAL_RAMCFG_GetError() function allows the user to get the RAMCFG peripheral error code.

This section contains the following APIs:

- *HAL_RAMCFG_GetState()*
- *HAL_RAMCFG_GetError()*

58.2.9 Detailed description of functions

HAL_RAMCFG_Init

Function name

HAL_StatusTypeDef HAL_RAMCFG_Init (RAMCFG_HandleTypeDef * hramcfg)

Function description

Initialize the RAMCFG by clearing flags and disabling interrupts.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_DeInit

Function name

HAL_StatusTypeDef HAL_RAMCFG_DeInit (RAMCFG_HandleTypeDef * hramcfg)

Function description

DeInitialize the RAMCFG peripheral.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_MspInit

Function name

void HAL_RAMCFG_MspInit (RAMCFG_HandleTypeDef * hramcfg)

Function description

Initialize the RAMCFG MSP.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_MspDeInit

Function name

void HAL_RAMCFG_MspDeInit (RAMCFG_HandleTypeDef * hramcfg)

Function description

DeInitialize the RAMCFG MSP.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_StartECC

Function name

HAL_StatusTypeDef HAL_RAMCFG_StartECC (RAMCFG_HandleTypeDef * hramcfg)

Function description

Start ECC mechanism for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_StopECC

Function name

HAL_StatusTypeDef HAL_RAMCFG_StopECC (RAMCFG_HandleTypeDef * hramcfg)

Function description

Stop ECC mechanism for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_EnableNotification

Function name

HAL_StatusTypeDef HAL_RAMCFG_EnableNotification (RAMCFG_HandleTypeDef * hramcfg, uint32_t Notifications)

Function description

Enable the RAMCFG error interrupts.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **Notifications:** : Select the notification to be enabled. This parameter can be any value of RAMCFG Interrupts group.

Return values

- **HAL:** status.

HAL_RAMCFG_DisableNotification

Function name

HAL_StatusTypeDef HAL_RAMCFG_DisableNotification (RAMCFG_HandleTypeDef * hramcfg, uint32_t Notifications)

Function description

Disable the RAMCFG error interrupts.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **Notifications:** : Select the notification to be disabled. This parameter can be : RAMCFG_IT_SINGLEERR : Single Error Interrupt. RAMCFG_IT_DOUBLEERR : Double Error Interrupt.

Return values

- **HAL:** status.

HAL_RAMCFG_IsECCSingleErrorDetected

Function name

uint32_t HAL_RAMCFG_IsECCSingleErrorDetected (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Check if an ECC single error has occurred.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **State:** of bit (1 or 0).

HAL_RAMCFG_IsECCDoubleErrorDetected

Function name

uint32_t HAL_RAMCFG_IsECCDoubleErrorDetected (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Check if an ECC double error was occurred.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **State:** of bit (1 or 0).

HAL_RAMCFG_GetSingleErrorAddress

Function name

uint32_t HAL_RAMCFG_GetSingleErrorAddress (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG single error address.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **Single:** error address offset.

HAL_RAMCFG_GetDoubleErrorAddress

Function name

uint32_t HAL_RAMCFG_GetDoubleErrorAddress (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG double error address.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **Double:** error address offset.

HAL_RAMCFG_EnableWriteProtection

Function name

HAL_StatusTypeDef HAL_RAMCFG_EnableWriteProtection (RAMCFG_HandleTypeDef * hramcfg, uint32_t StartPage, uint32_t NbPage)

Function description

Enable write protection for the given page(s).

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **StartPage:** : Select the start page number.
- **NbPage:** : Number of page to be protected.

Return values

- **HAL:** status.

HAL_RAMCFG_Erase

Function name

HAL_StatusTypeDef HAL_RAMCFG_Erase (RAMCFG_HandleTypeDef * hramcfg)

Function description

Launch a Mass Erase for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_IRQHandler

Function name

void HAL_RAMCFG_IRQHandler (RAMCFG_HandleTypeDef * hramcfg)

Function description

Handles RAMCFG interrupt request.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **None.:**

HAL_RAMCFG_DetectSingleErrorCallback

Function name

void HAL_RAMCFG_DetectSingleErrorCallback (RAMCFG_HandleTypeDef * hramcfg)

Function description

RAMCFG single error detection callback.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_DetectDoubleErrorCallback

Function name

void HAL_RAMCFG_DetectDoubleErrorCallback (RAMCFG_HandleTypeDef * hramcfg)

Function description

RAMCFG double error detection callback.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_RAMCFG_RegisterCallback (RAMCFG_HandleTypeDef * hramcfg, HAL_RAMCFG_CallbackIDTypeDef CallbackID, void(*)(RAMCFG_HandleTypeDef *_hramcfg) pCallback)

Function description

Register RAMCFG callbacks.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **CallbackID:** : User Callback identifier a HAL_RAMCFG_CallbackIDTypeDef ENUM as parameter.
- **pCallback:** : Pointer to private callback function.

Return values

- **HAL:** status.

HAL_RAMCFG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_RAMCFG_UnRegisterCallback (RAMCFG_HandleTypeDef * hramcfg, HAL_RAMCFG_CallbackIDTypeDef CallbackID)

Function description

UnRegister RAMCFG callbacks.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **CallbackID:** : User Callback identifier a HAL_RAMCFG_CallbackIDTypeDef ENUM as parameter.

Return values

- **HAL:** status.

HAL_RAMCFG_GetError

Function name

uint32_t HAL_RAMCFG_GetError (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG peripheral error code.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **RAMCFG:** error code.

HAL_RAMCFG_GetState

Function name

HAL_RAMCFG_StateTypeDef HAL_RAMCFG_GetState (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG peripheral state.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **RAMCFG:** state.

58.3 RAMCFG Firmware driver defines

The following section lists the various define and macros of the module.

58.3.1 RAMCFG

RAMCFG

RAMCFG Error Codes

HAL_RAMCFG_ERROR_NONE

RAMCFG No Error

HAL_RAMCFG_ERROR_TIMEOUT

RAMCFG Timeout Error

HAL_RAMCFG_ERROR_BUSY

RAMCFG Busy Error

HAL_RAMCFG_ERROR_INVALID_CALLBACK

Invalid Callback error

RAMCFG Exported Macros

__HAL_RAMCFG_ENABLE_IT

Description:

- Enable the specified RAMCFG interrupts.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __INTERRUPT__: Specifies the RAMCFG interrupt sources to be enabled. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.
  - RAMCFG_IT_NMIERR : Double Error Interrupt redirection to NMI Mask.
  - RAMCFG_IT_ALL : All Interrupt Mask.

Return value:

- None

__HAL_RAMCFG_DISABLE_IT

Description:

- Disable the specified RAMCFG interrupts.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __INTERRUPT__: Specifies the RAMCFG interrupt sources to be disabled. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.

Return value:

- None

Notes:

- This macros is used only to disable RAMCFG_IT_SINGLEERR and RAMCFG_IT_DOUBLEERR interrupts. RAMCFG_IT_NMIERR interrupt can only be disabled by global peripheral reset or system reset.

__HAL_RAMCFG_GET_IT_SOURCE

Description:

- Check whether the specified RAMCFG interrupt source is enabled or not.

Parameters:

- __HANDLE__: : Specifies the RAMCFG Handle.
- __INTERRUPT__: : Specifies the RAMCFG interrupt source to check. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.
  - RAMCFG_IT_NMIERR : Double Error Interrupt Redirection to NMI Mask.

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_RAMCFG_GET_FLAG

Description:

- Get the RAMCFG pending flags.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __FLAG__: : Specifies the flag to be checked. This parameter can be one of the following values:
  - RAMCFG_FLAG_SINGLEERR : Single Error Detected and Corrected Flag.
  - RAMCFG_FLAG_DOUBLEERR : Double Error Detected Flag.
  - RAMCFG_FLAG_SRAMBUSY : SRAM Busy Flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_RAMCFG_CLEAR_FLAG

Description:

- Clear the RAMCFG pending flags.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __FLAG__: : Specifies the flag to be cleared. This parameter can be any combination of the following values:
  - RAMCFG_FLAG_SINGLEERR : Single Error Detected and Corrected Flag.
  - RAMCFG_FLAG_DOUBLEERR : Double Error Detected Flag.

Return value:

- None.

__HAL_RAMCFG_RESET_HANDLE_STATE

Description:

- Reset the RAMCFG handle state.

Parameters:

- __HANDLE__: : Specifies the RAMCFG Handle.

Return value:

- None.

RAMCFG Monitor Flags

RAMCFG_FLAG_SINGLEERR

RAMCFG Single Error Detected and Corrected Flag

RAMCFG_FLAG_DOUBLEERR

RAMCFG Double Error Detected Flag

RAMCFG_FLAG_SRAMBUSY

RAMCFG SRAM busy Flag

RAMCFG_FLAGS_ALL

RAMCFG All Flags

RAMCFG Interrupts

RAMCFG_IT_SINGLEERR

RAMCFG Single Error Interrupt

RAMCFG_IT_DOUBLEERR

RAMCFG Double Error Interrupt

RAMCFG_IT_NMIERR

RAMCFG Double Error redirected to NMI Interrupt

RAMCFG_IT_ALL

RAMCFG All RAMCFG interrupt

RAMCFG Keys

RAMCFG_ERASE_KEY1

RAMCFG launch Erase Key 1

RAMCFG_ERASE_KEY2

RAMCFG launch Erase Key 2

RAMCFG_ECC_KEY1

RAMCFG launch ECC Key 1

RAMCFG_ECC_KEY2

RAMCFG launch ECC Key 2

59 HAL RCC Generic Driver

59.1 RCC Firmware driver registers structures

59.1.1 RCC_PLLInitTypeDef

RCC_PLLInitTypeDef is defined in the stm32h5xx_hal_rcc.h

Data Fields

- ***uint32_t PLLState***
- ***uint32_t PLLSource***
- ***uint32_t PLLM***
- ***uint32_t PLLN***
- ***uint32_t PLLP***
- ***uint32_t PLLQ***
- ***uint32_t PLLR***
- ***uint32_t PLLRGE***
- ***uint32_t PLLVCOSEL***
- ***uint32_t PLLFRACN***

Field Documentation

- ***uint32_t RCC_PLLInitTypeDef::PLLState***
  PLLState: The new state of the PLL1. This parameter can be a value of ***RCC_PLL1_Config***
- ***uint32_t RCC_PLLInitTypeDef::PLLSource***
  PLLSource: PLL entry clock source. This parameter must be a value of ***RCC_PLL1_Clock_Source***
- ***uint32_t RCC_PLLInitTypeDef::PLLM***
  PLLM: Division factor for PLL1 VCO input clock. This parameter must be a number between Min_Data = 0 and Max_Data = 63
- ***uint32_t RCC_PLLInitTypeDef::PLLN***
  PLLN: Multiplication factor for PLL1 VCO output clock. This parameter must be a number between Min_Data = 4 and Max_Data = 512
- ***uint32_t RCC_PLLInitTypeDef::PLLP***
  PLLP: Division factor for system clock. This parameter must be a number between Min_Data = 2 and Max_Data = 128 odd division factors are not allowed
- ***uint32_t RCC_PLLInitTypeDef::PLLQ***
  PLLQ: Division factor for peripheral clocks. This parameter must be a number between Min_Data = 1 and Max_Data = 128
- ***uint32_t RCC_PLLInitTypeDef::PLLR***
  PLLR: Division factor for peripheral clocks. This parameter must be a number between Min_Data = 1 and Max_Data = 128
- ***uint32_t RCC_PLLInitTypeDef::PLLRGE***
  PLLRGE: PLL1 clock Input range This parameter must be a value of ***RCC_PLL1_VCI_Range***
- ***uint32_t RCC_PLLInitTypeDef::PLLVCOSEL***
  PLLVCOSEL: PLL1 clock Output range This parameter must be a value of ***RCC_PLL1_VCO_Range***
- ***uint32_t RCC_PLLInitTypeDef::PLLFRACN***
  PLLFRACN: Specifies Fractional Part Of The Multiplication Factor for PLL1 VCO It should be a value between 0 and 8191

59.1.2 RCC_OscInitTypeDef

RCC_OscInitTypeDef is defined in the stm32h5xx_hal_rcc.h

Data Fields

- ***uint32_t OscillatorType***
- ***uint32_t HSEState***
- ***uint32_t LSEState***

- ***uint32_t HSIState***
- ***uint32_t HSIDiv***
- ***uint32_t HSICalibrationValue***
- ***uint32_t LSIState***
- ***uint32_t CSIState***
- ***uint32_t CSICalibrationValue***
- ***uint32_t HSI48State***
- ***RCC_PLLInitTypeDef PLL***

Field Documentation

- ***uint32_t RCC_OscInitTypeDef::OscillatorType***
  The oscillators to be configured. This parameter can be a value of ***RCC_Oscillator_Type***
- ***uint32_t RCC_OscInitTypeDef::HSEState***
  The new state of the HSE. This parameter can be a value of ***RCC_HSE_Config***
- ***uint32_t RCC_OscInitTypeDef::LSEState***
  The new state of the LSE. This parameter can be a value of ***RCC_LSE_Config***
- ***uint32_t RCC_OscInitTypeDef::HSIState***
  The new state of the HSI. This parameter can be a value of ***RCC_HSI_Config***
- ***uint32_t RCC_OscInitTypeDef::HSIDiv***
  The division factor of the HSI. This parameter can be a value of ***RCC_HSI_Div***
- ***uint32_t RCC_OscInitTypeDef::HSICalibrationValue***
  The calibration trimming value (default is RCC_HSICALIBRATION_DEFAULT). This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x7F on the other devices
- ***uint32_t RCC_OscInitTypeDef::LSIState***
  The new state of the LSI. This parameter can be a value of ***RCC_LSI_Config***
- ***uint32_t RCC_OscInitTypeDef::CSIState***
  The new state of the CSI. This parameter can be a value of ***RCC_CSI_Config***
- ***uint32_t RCC_OscInitTypeDef::CSICalibrationValue***
  The calibration trimming value (default is RCC_CSICALIBRATION_DEFAULT). This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x3F
- ***uint32_t RCC_OscInitTypeDef::HSI48State***
  The new state of the HSI48. This parameter can be a value of ***RCC_HSI48_Config***
- ***RCC_PLLInitTypeDef RCC_OscInitTypeDef::PLL***
  PLL1 structure parameters

59.1.3 RCC_ClkInitTypeDef

RCC_ClkInitTypeDef is defined in the stm32h5xx_hal_rcc.h

Data Fields

- ***uint32_t ClockType***
- ***uint32_t SYSCLKSource***
- ***uint32_t AHBCLKDivider***
- ***uint32_t APB1CLKDivider***
- ***uint32_t APB2CLKDivider***
- ***uint32_t APB3CLKDivider***

Field Documentation

- ***uint32_t RCC_ClkInitTypeDef::ClockType***
  The clock to be configured. This parameter can be a value of ***RCC_System_Clock_Type***
- ***uint32_t RCC_ClkInitTypeDef::SYSCLKSource***
  The clock source used as system clock (SYSCLK). This parameter can be a value of ***RCC_System_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::AHBCLKDivider***
  The AHB clock (HCLK) divider. This clock is derived from the system clock (SYSCLK). This parameter can be a value of ***RCC_AHB_Clock_Source***

- ***uint32_t RCC_ClkInitTypeDef::APB1CLKDivider***
  The APB1 clock (PCLK1) divider. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_APB2_APB3_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB2CLKDivider***
  The APB2 clock (PCLK2) divider. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_APB2_APB3_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB3CLKDivider***
  The APB3 clock (PCLK3) divider. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_APB2_APB3_Clock_Source***

59.2 RCC Firmware driver API description

The following section lists the various functions of the RCC library.

59.2.1 RCC specific features

After reset the device is running from High Speed Internal oscillator (64 MHz) with Flash 3 wait states. Flash prefetch buffer, D-Cache and I-Cache are disabled, and all peripherals are off except internal SRAM, Flash and JTAG.

- There is no prescaler on High speed (AHBs) and Low speed (APBs) busses: all peripherals mapped on these busses are running at HSI speed.
- The clock for all peripherals is switched off, except the SRAM and FLASH.
- All GPIOs are in analog mode, except the JTAG pins which are assigned to be used for debug purpose.

Once the device started from reset, the user application has to:

- Configure the clock source to be used to drive the System clock (if the application needs higher frequency/ performance)
- Configure the System clock frequency and Flash settings
- Configure the AHB and APB busses prescalers
- Enable the clock for the peripheral(s) to be used
- Configure the clock source(s) for peripherals which clocks are not derived from the System clock (SAIx, RTC, ADC, USB, SDMMC, etc.)

59.2.2 Initialization and de-initialization functions

This section provides functions allowing to configure the internal and external oscillators (HSE, HSI, LSE, CSI, LSI, PLL1, HSE CSS and MCOs) and the System busses clocks (SYSCLK, AHB, APB1, APB2 and APB3).

Internal/external clock and PLL configuration (+) HSI (high-speed internal): 64 MHz factory-trimmed RC used directly or through the PLL as System clock source.

1. CSI is a low-power RC oscillator which can be used directly as system clock, peripheral clock, or PLL input. But even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator. (+) LSI (low-speed internal): 32 KHz low consumption RC used as IWDG and/or RTC clock source. (+) HSE (high-speed external): 4 to 48 MHz crystal oscillator used directly or through the PLL as System clock source. Can be used also optionally as RTC clock source. (+) LSE (low-speed external): 32.768 KHz oscillator used optionally as RTC clock source. (+) PLL1 (clocked by HSI, HSE or CSI) providing up to three independent output clocks:
   – The first output is used to generate the high speed system clock (up to 250MHz).
   – The second output is used to generate the clock for the USB (48 MHz), the FDCAN1/2, the SPI1/2/3, the OCTOSPI, the RNG (<=48 MHz), the SDMMC1/2 and to generate an accurate clock to achieve high-quality audio performance on SAI1/2 interface. (+) PLL2 (clocked by HSI, HSE or CSI) providing up to three independent output clocks:
   – The first output is used to generate the clock for the LPTIMs, the SPI1/2/3 and to generate an accurate clock to achieve high-quality audio performance on SAI1/2 interface.
   – The second output is used to generate the clock for USARTs, the UARTs, the LPUART1, the FDCAN1/2, the SPI4/5/6 and the USB.
   – The third output is used to generate the clock the SDMMC1/2, the ADC/DAC, the I2C1/2, the I3C1/2 and the OCTOSPI. (+) PLL3 (clocked by HSI , HSE or CSI) providing up to three independent output clocks:
   – The first output is used to generate the clock for SPI1/2/3 and to generate an accurate clock to achieve high-quality audio performance on SAI1/2 interface.
   – The second output is used to generate the clock for USARTs, the UARTs, the LPUART1, the SPI4/5/6 and the USB.
   – The third output is used to generate the clock for the I2Cs, the I3Cs and the LPTIMs. (+) HSE CSS (HSE Clock Security System): once enabled, if a HSE clock failure occurs (HSE used directly or through PLL1 as System clock source), the System clock is automatically switched to HSI and an interrupt is generated if enabled. The interrupt is linked to the Cortex-M33 NMI (Non-Maskable Interrupt) exception vector.
2. MCO1 (micro controller clock output1), used to output HSI, LSE, HSE, PLL1(PLL1_Q) or HSI48 clock (through a configurable pre-scaler) on PA8 pin.
3. MCO2 (micro controller clock output2), used to output HSE, PLL2(PLL2_P), SYSCLK, LSI, CSI, or PLL1(PLL1_P) clock (through a configurable pre-scaler) on PC9 pin.

Internal/external clock and PLL configuration

- HSI (high-speed internal): 64 MHz factory-trimmed RC used directly or through the PLL as System clock source. (#) CSI is a low-power RC oscillator which can be used directly as system clock, peripheral clock, or PLL input. But even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator.
- LSI (low-speed internal): 32 KHz low consumption RC used as IWDG and/or RTC clock source.
- HSE (high-speed external): 4 to 48 MHz crystal oscillator used directly or through the PLL as System clock source. Can be used also optionally as RTC clock source.
- LSE (low-speed external): 32.768 KHz oscillator used optionally as RTC clock source.
- PLL1 (clocked by HSI, HSE or CSI) providing up to three independent output clocks:
  – The first output is used to generate the high speed system clock (up to 250MHz).
  – The second output is used to generate the clock for the USB (48 MHz), the FDCAN1/2, the SPI1/2/3, the OCTOSPI, the RNG (<=48 MHz), the SDMMC1/2 and to generate an accurate clock to achieve high-quality audio performance on SAI1/2 interface.
- PLL2 (clocked by HSI, HSE or CSI) providing up to three independent output clocks:
  – The first output is used to generate the clock for the LPTIMs, the SPI1/2/3 and to generate an accurate clock to achieve high-quality audio performance on SAI1/2 interface.
  – The second output is used to generate the clock for USARTs, the UARTs, the LPUART1, the FDCAN1/2, the SPI4/5/6 and the USB.
  – The third output is used to generate the clock the SDMMC1/2, the ADC/DAC, the I2C1/2, the I3C1/2 and the OCTOSPI.

- PLL3 (clocked by HSI , HSE or CSI) providing up to three independent output clocks:
  - The first output is used to generate the clock for SPI1/2/3 and to generate an accurate clock to achieve high-quality audio performance on SAI1/2 interface.
  - The second output is used to generate the clock for USARTs, the UARTs, the LPUART1, the SPI4/5/6 and the USB.
  - The third output is used to generate the clock for the I2Cs, the I3Cs and the LPTIMs.
- HSE CSS (HSE Clock Security System): once enabled, if a HSE clock failure occurs (HSE used directly or through PLL1 as System clock source), the System clock is automatically switched to HSI and an interrupt is generated if enabled. The interrupt is linked to the Cortex-M33 NMI (Non-Maskable Interrupt) exception vector. (#) MCO1 (micro controller clock output1), used to output HSI, LSE, HSE, PLL1(PLL1_Q) or HSI48 clock (through a configurable pre-scaler) on PA8 pin. (#) MCO2 (micro controller clock output2), used to output HSE, PLL2(PLL2_P), SYSCLK, LSI, CSI, or PLL1(PLL1_P) clock (through a configurable pre-scaler) on PC9 pin.

System, AHB and APB busses clocks configuration

- Several clock sources can be used to drive the System clock (SYSCLK): CSI, HSI, HSE and the main PLL. The AHB clock (HCLK) is derived from System clock through configurable prescaler and used to clock the CPU, memory and peripherals mapped on AHB bus (DMA, GPIO...). APB1 (PCLK1), APB2 (PCLK2) and APB3 (PCLK3) clocks are derived from AHB clock through configurable prescalers and used to clock the peripherals mapped on these busses. You can use "HAL_RCC_GetSysClockFreq()" function to retrieve the frequencies of these clocks.

Note: All the peripheral clocks are derived from the System clock (SYSCLK) except:

- *SAI: the SAI clock can be derived either from specific PLL (PLL1, PLL2 or PLL3), the per_ck clock (HSE, HSI or CSI) or from an external clock mapped on the SAI_CKIN pin. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *SPI/I2S: the SPI1/2/3 clock can be derived either from specific PLL (PLL1, PLL2 or PLL3), the per_ck clock (HSE, HSI or CSI) or from an external clock mapped on the SPI_CKIN pin. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *RTC: the RTC clock can be derived either from the LSI, LSE or HSE clock divided by 2 to 31. You have to use __HAL_RCC_RTC_ENABLE() and HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *USB: USB requires a frequency equal to 48 MHz to work correctly. This clock is derived of the main PLL or PLL2 through PLLQ divider. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *UCPD: the UCPD clock is derived from HSI (divided by 4) clock.*
- *SDMMC: SDMMC1/2 peripherals require a frequency equal or lower than 48 MHz. This clock is derived from the PLL1 or PLL2 through PLL1Q or PLL2R divider. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *IWDG clock which is always the LSI clock. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *RNG: the RNG clock can be derived either from PLL1Q, HSI48, LSE or LSI clock. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *DAC: the DAC clock can be derived either from LSE or LSI clock. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *FDCAN: the FDCAN1/2 clock can be derived either from HSE, PLL1Q or PLL2Q clock. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *CEC: the CEC clock can be derived either from LSE, LSI or CSI (divided by 122) clock.You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *ETH: the Ethernet clock is derived from PLL1Q clock.*

- The maximum frequency of the SYSCLK, HCLK, PCLK1, PCLK2 and PCLK3 is 250 MHz. The clock source frequency should be adapted depending on the device voltage range as listed in the Reference Manual "Clock source frequency versus voltage scaling" chapter.

This section contains the following APIs:

- ***HAL_RCC_DeInit()***
- ***HAL_RCC_OscConfig()***
- ***HAL_RCC_ClockConfig()***

59.2.3 Peripheral Control functions

This subsection provides a set of functions allowing to:

- Output clock to MCO pin.
- Retrieve current clock frequencies.
- Enable the Clock Security System.

This section contains the following APIs:

- *HAL_RCC_MCOConfig()*
- *HAL_RCC_GetSysClockFreq()*
- *HAL_RCC_GetHCLKFreq()*
- *HAL_RCC_GetPCLK1Freq()*
- *HAL_RCC_GetPCLK2Freq()*
- *HAL_RCC_GetPCLK3Freq()*
- *HAL_RCC_GetOscConfig()*
- *HAL_RCC_GetClockConfig()*
- *HAL_RCC_GetResetSource()*
- *HAL_RCC_EnableCSS()*
- *HAL_RCC_NMI_IRQHandler()*
- *HAL_RCC_CSSCallback()*

59.2.4 RCC attributes functions

This subsection provides a set of functions allowing to:

- Configure the RCC item(s) attributes.
- Get the attribute of an RCC item.

This section contains the following APIs:

- *HAL_RCC_ConfigAttributes()*
- *HAL_RCC_GetConfigAttributes()*

59.2.5 Detailed description of functions

HAL_RCC_DeInit

Function name

HAL_StatusTypeDef HAL_RCC_DeInit (void)

Function description

Reset the RCC clock configuration to the default reset state.

Return values

- **HAL:** Status.

Notes

- The default reset state of the clock configuration is given below: HSI ON and used as system clock sourceHSE, CSI, PLL, PLL2 and PLL3 OFFAHB, APB1 and APB2 prescaler set to 1.HSECSS, MCO1 and MCO2 OFFAll interrupts disabled
- This function doesn't modify the configuration of the Peripheral clocksLSI, LSE and RTC clocks

HAL_RCC_OscConfig

Function name

HAL_StatusTypeDef HAL_RCC_OscConfig (const RCC_OscInitTypeDef * pOscInitStruct)

Function description

Initialize the RCC Oscillators according to the specified parameters in the RCC_OscInitTypeDef.

Parameters

- **pOscInitStruct:** pointer to an RCC_OscInitTypeDef structure that contains the configuration information for the RCC Oscillators.

Return values

- **HAL:** status

Notes

- The PLL is not disabled when used as system clock.
- Transitions LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this macro. User should request a transition to LSE Off first and then LSE On or LSE Bypass.
- Transition HSE Bypass to HSE On and HSE On to HSE Bypass are not supported by this macro. User should request a transition to HSE Off first and then HSE On or HSE Bypass.

HAL_RCC_ClockConfig

Function name

HAL_StatusTypeDef HAL_RCC_ClockConfig (const RCC_ClkInitTypeDef * pClkInitStruct, uint32_t FLatency)

Function description

Initialize the CPU, AHB and APB busses clocks according to the specified parameters in the pClkInitStruct.

Parameters

- **pClkInitStruct:** pointer to an RCC_OscInitTypeDef structure that contains the configuration information for the RCC peripheral.
- **FLatency:** FLASH Latency This parameter can be one of the following values:
  - FLASH_LATENCY_0 FLASH 0 Latency cycle
  - FLASH_LATENCY_1 FLASH 1 Latency cycle
  - FLASH_LATENCY_2 FLASH 2 Latency cycles
  - FLASH_LATENCY_3 FLASH 3 Latency cycles
  - FLASH_LATENCY_4 FLASH 4 Latency cycles
  - FLASH_LATENCY_5 FLASH 5 Latency cycles

Return values

- **HAL:** Status.

Notes

- The SystemCoreClock CMSIS variable is used to store System Clock Frequency and updated by HAL_RCC_GetHCLKFreq() function called within this function
- The HSI is used by default as system clock source after startup from Reset, wake-up from STANDBY mode. After restart from Reset, the HSI frequency is set to its default value 64 MHz.
- The HSI or CSI can be selected as system clock source after wake-up from STOP modes or in case of failure of the HSE when used directly or indirectly as system clock (if the Clock Security System CSS is enabled).
- A switch from one clock source to another occurs only if the target clock source is ready (clock stable after startup delay or PLL locked). If a clock source which is not yet ready is selected, the switch will occur when the clock source is ready.
- You can use HAL_RCC_GetClockConfig() function to know which clock is currently used as system clock source.

HAL_RCC_MCOConfig

Function name

void HAL_RCC_MCOConfig (uint32_t RCC_MCOx, uint32_t RCC_MCOSource, uint32_t RCC_MCODiv)

Function description

Select the clock source to output on MCO1 pin(PA8) or on MCO2 pin(PC9).

Parameters

- **RCC_MCOx:** specifies the output direction for the clock source. For STM32H5xx family this parameter can have only one value:
  - RCC_MCO1 Clock source to output on MCO1 pin(PA8).
  - RCC_MCO2 Clock source to output on MCO2 pin(PC9).
- **RCC_MCOSource:** specifies the clock source to output. This parameter can be one of the following values:
  - RCC_MCO1SOURCE_HSI: HSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_LSE: LSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSE: HSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_PLL1QCLK: PLL1Q clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSI48: HSI48 (48MHZ) selected as MCO1 source
  - RCC_MCO2SOURCE_SYSCLK: System clock (SYSCLK) selected as MCO2 source
  - RCC_MCO2SOURCE_PLL2PCLK: PLL2P clock selected as MCO2 source
  - RCC_MCO2SOURCE_HSE: HSE clock selected as MCO2 source
  - RCC_MCO2SOURCE_PLL1PCLK: PLL1P clock selected as MCO2 source
  - RCC_MCO2SOURCE_CSI: CSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_LSI: LSI clock selected as MCO2 source
- **RCC_MCODiv:** specifies the MCO prescaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 up to RCC_MCODIV_15 : divider applied to MCOx clock

Return values

- **None:**

Notes

- PA8/PC9 should be configured in alternate function mode.

HAL_RCC_EnableCSS

Function name

void HAL_RCC_EnableCSS (void)

Function description

Enable the HSE Clock Security System.

Return values

- **None:**

Notes

- If a failure is detected on the HSE oscillator clock, this oscillator is automatically disabled and an interrupt is generated to inform the software about the failure (Clock Security System Interrupt, CSSI), allowing the MCU to perform rescue operations. The CSSI is linked to the Cortex-M NMI (Non-Maskable Interrupt) exception vector.
- The Clock Security System can only be cleared by reset.

HAL_RCC_GetSysClockFreq

Function name

uint32_t HAL_RCC_GetSysClockFreq (void)

Function description

Return the SYSCLK frequency.

Return values

- **SYSCLK:** frequency

Notes

- The system frequency computed by this function may not be the real frequency in the chip. It is calculated based on the predefined constants of the selected clock source:
- If SYSCLK source is HSI, function returns values based on HSI_VALUE(*)
- If SYSCLK source is CSI, function returns values based on CSI_VALUE(**)
- If SYSCLK source is HSE, function returns values based on HSE_VALUE(***)
- If SYSCLK source is PLL, function returns values based on HSI_VALUE(*), CSI_VALUE(**) or HSE_VALUE(***) multiplied/divided by the PLL factors.
- (*) HSI_VALUE is a constant defined in stm32h5xx_hal_conf.h file (default value 64 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (**) CSI_VALUE is a constant defined in stm32h5xx_hal_conf.h file (default value 4 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (***) HSE_VALUE is a constant defined in stm32h5xx_hal_conf.h file (default value 24 MHz), user has to ensure that HSE_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.
- The result of this function could be not correct when using fractional value for HSE crystal.
- This function can be used by the user application to compute the baudrate for the communication peripherals or configure other parameters.
- Each time SYSCLK changes, this function must be called to update the right SYSCLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetHCLKFreq

Function name

uint32_t HAL_RCC_GetHCLKFreq (void)

Function description

Return the HCLK frequency.

Return values

- **HCLK:** frequency in Hz

Notes

- Each time HCLK changes, this function must be called to update the right HCLK value. Otherwise, any configuration based on this function will be incorrect.
- The SystemCoreClock CMSIS variable is used to store System Clock Frequency.

HAL_RCC_GetPCLK1Freq

Function name

uint32_t HAL_RCC_GetPCLK1Freq (void)

Function description

Return the PCLK1 frequency.

Return values

- **PCLK1:** frequency in Hz

Notes

- Each time PCLK1 changes, this function must be called to update the right PCLK1 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK2Freq

Function name

uint32_t HAL_RCC_GetPCLK2Freq (void)

Function description

Return the PCLK2 frequency.

Return values

- **PCLK2:** frequency in Hz

Notes

- Each time PCLK2 changes, this function must be called to update the right PCLK2 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK3Freq

Function name

uint32_t HAL_RCC_GetPCLK3Freq (void)

Function description

Return the PCLK3 frequency.

Return values

- **PCLK3:** frequency in Hz

Notes

- Each time PCLK3 changes, this function must be called to update the right PCLK3 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetOscConfig

Function name

void HAL_RCC_GetOscConfig (RCC_OscInitTypeDef * pOscInitStruct)

Function description

Configure the pOscInitStruct according to the internal RCC configuration registers.

Parameters

- **pOscInitStruct:** pointer to an RCC_OscInitTypeDef structure that will be configured.

Return values

- **None:**

HAL_RCC_GetClockConfig

Function name

void HAL_RCC_GetClockConfig (RCC_ClkInitTypeDef * pClkInitStruct, uint32_t * pFLatency)

Function description

Configure the pClkInitStruct according to the internal RCC configuration registers.

Parameters

- **pClkInitStruct:** pointer to an RCC_ClkInitTypeDef structure that will be configured.
- **pFLatency:** Pointer on the Flash Latency.

Return values

- **None:**

HAL_RCC_NMI_IRQHandler

Function name

void HAL_RCC_NMI_IRQHandler (void)

Function description

Handle the RCC Clock Security System interrupt request.

Return values

- **None:**

Notes

- This API should be called under the NMI_Handler().

HAL_RCC_CSSCallback

Function name

void HAL_RCC_CSSCallback (void)

Function description

RCC HSE Clock Security System interrupt callback.

Return values

- **none:**

HAL_RCC_GetResetSource

Function name

uint32_t HAL_RCC_GetResetSource (void)

Function description

Get and clear reset flags.

Return values

- **can:** be a combination of Reset Flag

Notes

- Once reset flags are retrieved, this API is clearing them in order to isolate next reset reason.

HAL_RCC_ConfigAttributes

Function name

void HAL_RCC_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the RCC item(s) attribute(s).

Parameters

- **Item:** Item(s) to set attributes on. This parameter can be a one or a combination of RCC items (**).
- **Attributes:** specifies the RCC secure/privilege attributes. This parameter can be a value of RCC attributes

Return values

- **None:** (*) : For stm32h503xx devices, attributes specifies the privilege attribute only (no items). (**) : For stm32h503xx devices, this parameter is unused, it can take 0 or any other numerical value.

Notes

- Available attributes are to secure items and set RCC as privileged (*). Default state is non-secure and unprivileged access allowed.
- Secure and non-secure attributes can only be set from the secure state when the system implements the security (TZEN=1).

HAL_RCC_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_RCC_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get the attribute of an RCC item.

Parameters

- **Item:** Single item to get secure/non-secure and privilege/non-privilege attribute from. This parameter can be a one value of RCC items except RCC_ALL. (*)
- **pAttributes:** pointer to return the attributes.

Return values

- **HAL:** Status.

Notes

- Secure and non-secure attributes are only available from secure state when the system implements the security (TZEN=1)

59.3 RCC Firmware driver defines

The following section lists the various define and macros of the module.

59.3.1 RCC

RCC

RCC Backup Domain Reset

__HAL_RCC_BACKUPRESET_FORCE

Description:

- Macros to force or release the Backup domain reset.

Return value:

- None

Notes:

- This function resets the RTC peripheral (including the backup registers) and the RTC clock source selection in RCC_BDCR register. The BKPSRAM is not affected by this reset.

__HAL_RCC_BACKUPRESET_RELEASE

CSI Config

RCC_CSI_OFF

CSI clock deactivation

RCC_CSI_ON

CSI clock activation

RCC_CSICALIBRATION_DEFAULT

Default CSI calibration trimming value

RCC Exported Macros

__HAL_RCC_HSI_DIVIDER_CONFIG

Description:

- Macro to configure the Internal High Speed oscillator (HSI).

Parameters:

- __HSIDIV__: specifies the HSI division factor. This parameter can be one of the following values:
  - RCC_HSI_DIV1 Divide the HSI oscillator clock by 1 (default after reset)
  - RCC_HSI_DIV2 Divide the HSI oscillator clock by 2
  - RCC_HSI_DIV4 Divide the HSI oscillator clock by 4
  - RCC_HSI_DIV8 Divide the HSI oscillator clock by 8

__HAL_RCC_GET_HSI_DIVIDER

Description:

- Macro to get the HSI divider.

Return value:

- The: HSI divider. The returned value can be one of the following:
  - RCC_HSI_DIV1 HSI oscillator divided by 1
  - RCC_HSI_DIV2 HSI oscillator divided by 2
  - RCC_HSI_DIV4 HSI oscillator divided by 4
  - RCC_HSI_DIV8 HSI oscillator divided by 8

__HAL_RCC_HSI_ENABLE

Description:

- Macros to enable or disable the Internal High Speed 64MHz oscillator (HSI).

Return value:

- None

Notes:

- The HSI is stopped by hardware when entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after startup from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the HSE Clock Security System HSECSS is enabled). HSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the HSI. After enabling the HSI, the application software should wait on HSIRDY flag to be set indicating that HSI clock is stable and can be used as system clock source. This parameter can be: ENABLE or DISABLE. When the HSI is stopped, HSIRDY flag goes low after 6 HSI oscillator clock cycles.

__HAL_RCC_HSI_DISABLE

__HAL_RCC_HSI_CALIBRATIONVALUE_ADJUST

Description:

- Macro to adjust the Internal High Speed 64MHz oscillator (HSI) calibration value.

Parameters:

- __HSICALIBRATIONVALUE__: specifies the calibration trimming value (default is RCC_HSICALIBRATION_DEFAULT). This parameter must be a number between 0 and 0x7F.

Return value:

- None

Notes:

- The calibration is used to compensate for the variations in voltage and temperature that influence the frequency of the internal HSI RC.

__HAL_RCC_HSISTOP_ENABLE

Description:

- Macros to enable or disable the force of the Internal High Speed oscillator (HSI) in STOP mode to be quickly available as kernel clock for USARTs, LPUART and I2Cs.

Return value:

- None

Notes:

- Keeping the HSI ON in STOP mode allows to avoid slowing down the communication speed because of the HSI startup time. The enable of this function has not effect on the HSION bit. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_HSISTOP_DISABLE

__HAL_RCC_CSI_ENABLE

Description:

- Macros to enable or disable the Internal Low-power oscillator (CSI).

Return value:

- None

Notes:

- The CSI is stopped by hardware when entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after startup from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the HSE Clock Security System HSECSS is enabled and CSI is selected as system clock after wake up from system stop). CSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the CSI. After enabling the CSI, the application software should wait on CSIRDY flag to be set indicating that CSI clock is stable and can be used as system clock source. When the CSI is stopped, CSIRDY flag goes low after 6 CSI oscillator clock cycles.

__HAL_RCC_CSI_DISABLE

__HAL_RCC_CSI_CALIBRATIONVALUE_ADJUST

Description:

- Macro Adjusts the Internal oscillator (CSI) calibration value.

Parameters:

- __CSICalibrationValue__: specifies the calibration trimming value. This parameter must be a number between 0 and 0x3F.

Notes:

- The calibration is used to compensate for the variations in voltage and temperature that influence the frequency of the internal CSI RC.

__HAL_RCC_CSISTOP_ENABLE

Description:

- Macros to enable or disable the force of the Low-power Internal oscillator (CSI) in STOP mode to be quickly available as kernel clock for USARTs and I2Cs.

Return value:

- None

Notes:

- Keeping the CSI ON in STOP mode allows to avoid slowing down the communication speed because of the CSI start-up time. The enable of this function has not effect on the CSION bit. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_CSISTOP_DISABLE

__HAL_RCC_LSI_ENABLE

Description:

- Macros to enable or disable the Internal Low Speed oscillator (LSI).

Return value:

- None

Notes:

- After enabling the LSI, the application software should wait on LSIRDY flag to be set indicating that LSI clock is stable and can be used to clock the IWDG and/or the RTC. LSI can not be disabled if the IWDG is running. When the LSI is stopped, LSIRDY flag goes low after 6 LSI oscillator clock cycles.

__HAL_RCC_LSI_DISABLE

__HAL_RCC_HSE_CONFIG

Description:

- Macro to configure the External High Speed oscillator (HSE).

Parameters:

- __STATE__: specifies the new state of the HSE. This parameter can be one of the following values:
  - RCC_HSE_OFF Turn OFF the HSE oscillator, HSERDY flag goes low after 6 HSE oscillator clock cycles.
  - RCC_HSE_ON Turn ON the HSE oscillator.
  - RCC_HSE_BYPASS HSE oscillator bypassed with external clock.
  - RCC_HSE_BYPASS_DIGITAL HSE oscillator bypassed with digital external clock.

Return value:

- None

Notes:

- Transition HSE Bypass to HSE On and HSE On to HSE Bypass are not supported by this macro. User should request a transition to HSE Off first and then HSE On or HSE Bypass. After enabling the HSE (RCC_HSE_ON or RCC_HSE_Bypass), the application software should wait on HSERDY flag to be set indicating that HSE clock is stable and can be used to clock the PLLs and/or system clock. HSE state can not be changed if it is used directly or through the PLL1 as system clock. In this case, you have to select another source of the system clock then change the HSE state (ex. disable it). The HSE is stopped by hardware when entering STOP and STANDBY modes.

__HAL_RCC_LSE_CONFIG

Description:

- Macro to configure the External Low Speed oscillator (LSE).

Parameters:

- __STATE__: specifies the new state of the LSE. This parameter can be one of the following values:
  - RCC_LSE_OFF Turn OFF the LSE oscillator, LSERDY flag goes low after 6 LSE oscillator clock cycles.
  - RCC_LSE_ON Turn ON the LSE oscillator.
  - RCC_LSE_BYPASS LSE oscillator bypassed with external clock.
  - RCC_LSE_BYPASS_DIGITAL LSE oscillator bypassed with external digital clock.

Return value:

- None

Notes:

- Transitions LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this macro. User should request a transition to LSE Off first and then LSE On or LSE Bypass. As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable write access using HAL_PWR_EnableBkUpAccess() function before to configure the LSE (to be done once after reset). After enabling the LSE (RCC_LSE_ON or RCC_LSE_BYPASS), the application software should wait on LSERDY flag to be set indicating that LSE clock is stable and can be used to clock the RTC.

__HAL_RCC_HSI48_ENABLE

Description:

- Macros to enable or disable the Internal High Speed 48MHz oscillator (HSI48).

Return value:

- None

Notes:

- The HSI48 is stopped by hardware when entering STOP and STANDBY modes. After enabling the HSI48, the application software should wait on HSI48RDY flag to be set indicating that HSI48 clock is stable. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_HSI48_DISABLE

__HAL_RCC_RTC_CLKPRESCALER

Description:

- Macros to configure the RTC clock (RTCCLK).

Parameters:

- __RTCCLKSource__: specifies the RTC clock source. This parameter can be one of the following values:
  - RCC_RTCCLKSOURCE_LSE LSE selected as RTC clock.
  - RCC_RTCCLKSOURCE_LSI LSI selected as RTC clock.
  - RCC_RTCCLKSOURCE_HSE_DIVx HSE clock divided by x selected as RTC clock, where x can be between 2 and 63

Notes:

- As the RTC clock configuration bits are in the Backup domain and write access is denied to this domain after reset, you have to enable write access using the Power Backup Access macro before to configure the RTC clock source (to be done once after reset). Once the RTC clock is configured it cannot be changed unless the Backup domain is reset using __HAL_RCC_BackupReset_RELEASE() macro, or by a Power On Reset (POR).
- If the LSE or LSI is used as RTC clock source, the RTC continues to work in STOP and STANDBY modes, and can be used as wakeup source. However, when the HSE clock is used as RTC clock source, the RTC cannot be used in STOP and STANDBY modes. The maximum input clock frequency for RTC is 1MHz (when using HSE as RTC clock source).

__HAL_RCC_RTC_CONFIG

__HAL_RCC_GET_RTC_SOURCE

Description:

- Macro to get the RTC clock source.

Return value:

- The: returned value can be one of the following:
  - RCC_RTCCLKSOURCE_NO_CLK No clock selected as RTC clock.
  - RCC_RTCCLKSOURCE_LSE LSE selected as RTC clock.
  - RCC_RTCCLKSOURCE_LSI LSI selected as RTC clock.
  - RCC_RTCCLKSOURCE_HSE_DIVx HSE clock divided by x selected as RTC clock, where x can be between 2 and 63 (x can be retrieved with __HAL_RCC_GET_RTC_HSE_PRESCALER())

__HAL_RCC_GET_RTC_HSE_PRESCALER

Description:

- Macro to get the HSE division factor for RTC clock.

Return value:

- The: HSE division factor for RTC clock. The returned value can be one of the following:
  - RCC_RTC_HSE_NOCLOCK : No HSE Clock selected as RTC clock
  - RCC_RTC_HSE_DIV2 : HSE Divided by 2 selected as RTC clock
  - RCC_RTC_HSE_DIV3 : HSE Divided by 3 selected as RTC clock
  - RCC_RTC_HSE_DIV4 : HSE Divided by 4 selected as RTC clock
  - RCC_RTC_HSE_DIV5 : HSE Divided by 5 selected as RTC clock
  - RCC_RTC_HSE_DIV6 : HSE Divided by 6 selected as RTC clock
  - RCC_RTC_HSE_DIV7 : HSE Divided by 7 selected as RTC clock
  - RCC_RTC_HSE_DIV8 : HSE Divided by 8 selected as RTC clock
  - RCC_RTC_HSE_DIV9 : HSE Divided by 9 selected as RTC clock
  - RCC_RTC_HSE_DIV10 : HSE Divided by 10 selected as RTC clock
  - RCC_RTC_HSE_DIV11 : HSE Divided by 11 selected as RTC clock
  - RCC_RTC_HSE_DIV12 : HSE Divided by 12 selected as RTC clock
  - RCC_RTC_HSE_DIV13 : HSE Divided by 13 selected as RTC clock
  - RCC_RTC_HSE_DIV14 : HSE Divided by 14 selected as RTC clock
  - RCC_RTC_HSE_DIV15 : HSE Divided by 15 selected as RTC clock
  - RCC_RTC_HSE_DIV16 : HSE Divided by 16 selected as RTC clock
  - RCC_RTC_HSE_DIV17 : HSE Divided by 17 selected as RTC clock
  - RCC_RTC_HSE_DIV18 : HSE Divided by 18 selected as RTC clock
  - RCC_RTC_HSE_DIV19 : HSE Divided by 19 selected as RTC clock
  - RCC_RTC_HSE_DIV20 : HSE Divided by 20 selected as RTC clock
  - RCC_RTC_HSE_DIV21 : HSE Divided by 21 selected as RTC clock
  - RCC_RTC_HSE_DIV22 : HSE Divided by 22 selected as RTC clock
  - RCC_RTC_HSE_DIV23 : HSE Divided by 23 selected as RTC clock
  - RCC_RTC_HSE_DIV24 : HSE Divided by 24 selected as RTC clock
  - RCC_RTC_HSE_DIV25 : HSE Divided by 25 selected as RTC clock
  - RCC_RTC_HSE_DIV26 : HSE Divided by 26 selected as RTC clock
  - RCC_RTC_HSE_DIV27 : HSE Divided by 27 selected as RTC clock
  - RCC_RTC_HSE_DIV28 : HSE Divided by 28 selected as RTC clock
  - RCC_RTC_HSE_DIV29 : HSE Divided by 29 selected as RTC clock
  - RCC_RTC_HSE_DIV30 : HSE Divided by 30 selected as RTC clock
  - RCC_RTC_HSE_DIV31 : HSE Divided by 31 selected as RTC clock
  - RCC_RTC_HSE_DIV32 : HSE Divided by 32 selected as RTC clock
  - RCC_RTC_HSE_DIV33 : HSE Divided by 33 selected as RTC clock
  - RCC_RTC_HSE_DIV34 : HSE Divided by 34 selected as RTC clock

__HAL_RCC_PLL1_ENABLE

Notes:

- After enabling the main PLL, the application software should wait on PLLRDY flag to be set indicating that PLL clock is stable and can be used as system clock source. The main PLL can not be disabled if it is used as system clock source The main PLL is disabled by hardware when entering STOP and STANDBY modes.

__HAL_RCC_PLL1_DISABLE

__HAL_RCC_PLL1_CLKOUT_ENABLE

Description:

- Enables or disables each clock output (PLL1P_CLK, PLL1Q_CLK, PLL1R_CLK)

Parameters:

- __PLL1_CLOCKOUT__: specifies the PLL clock to be outputted This parameter can be one of the following values:
  - RCC_PLL1_DIVP: This Clock is used to generate the high speed system clock (up to 250MHz)
  - RCC_PLL1_DIVQ: This Clock is used to generate the clock for USB (48 MHz), RNG (<=48 MHz), OCTOSPI, SPI, SAI and Ethernet
  - RCC_PLL1_DIVR: This Clock is used to generate an accurate clock

Return value:

- None

Notes:

- Enabling/disabling Those Clocks can be any time without the need to stop the PLL1, (except the ck_pll_p of the System PLL that cannot be stopped if used as System Clock. This is mainly used to save Power.

__HAL_RCC_PLL1_CLKOUT_DISABLE

__HAL_RCC_GET_PLL1_CLKOUT_CONFIG

Description:

- Macro to get the PLL clock output enable status.

Parameters:

- __PLL1_CLOCKOUT__: specifies the PLL1 clock to be output. This parameter can be one of the following values:
  - RCC_PLL1_DIVP: This Clock is used to generate the high speed system clock (up to 250MHz)
  - RCC_PLL1_DIVQ: This Clock is used to generate the clock for USB (48 MHz), RNG (<=48 MHz), OCTOSPI, SPI, SAI and Ethernet
  - RCC_PLL1_DIVR: This Clock is used to generate an accurate clock

Return value:

- SET: / RESET

__HAL_RCC_PLL1_FRACN_ENABLE

Description:

- Enables or disables Fractional Part Of The Multiplication Factor of PLL1 VCO.

Return value:

- None

Notes:

- Enabling/disabling Fractional Part can be any time without the need to stop the PLL1

__HAL_RCC_PLL1_FRACN_DISABLE

__HAL_RCC_PLL1_CONFIG

Description:

- Macro to configures the main PLL (PLL1) clock source, multiplication and division factors.

Parameters:

- __PLL1SOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLL1_SOURCE_CSI: CSI oscillator clock selected as PLL1 clock entry
  - RCC_PLL1_SOURCE_HSI: HSI oscillator clock selected as PLL1 clock entry
  - RCC_PLL1_SOURCE_HSE: HSE oscillator clock selected as PLL1 clock entry
- __PLL1M__: specifies the division factor for PLL VCO input clock This parameter must be a number between 1 and 63.
- __PLL1N__: specifies the multiplication factor for PLL VCO output clock This parameter must be a number between 4 and 512.
- __PLL1P__: specifies the division factor for system clock. This parameter must be a number between 2 and 128 (where odd numbers not allowed)
- __PLL1Q__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128
- __PLL1R__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128

Return value:

- None

Notes:

- This function must be used only when the main PLL1 is disabled.
- This clock source (__PLL1SOURCE__) is the clock source for PLL1 (main PLL) and is different from PLL2 & PLL3 clock sources.
- You have to set the PLL1M parameter correctly to ensure that the VCO input frequency ranges from 1 to 16 MHz.
- You have to set the PLL1N parameter correctly to ensure that the VCO output frequency is between 150 and 420 MHz (when in medium VCO range) or between 192 and 836 MHZ (when in wide VCO range)

__HAL_RCC_PLL1_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL1 clock source.

Parameters:

- __PLL1SOURCE__: specifies the PLL1 entry clock source. This parameter can be one of the following values:
  - RCC_PLL1_SOURCE_CSI: CSI oscillator clock selected as PLL1 clock entry
  - RCC_PLL1_SOURCE_HSI: HSI oscillator clock selected as PLL1 clock entry
  - RCC_PLL1_SOURCE_HSE: HSE oscillator clock selected as PLL1 clock entry

Notes:

- This function must be used only when PLL1 is disabled.

__HAL_RCC_PLL1_DIVM_CONFIG

Description:

- Macro to configure the PLL1 input clock division factor M.

Parameters:

- __PLL1M__: specifies the division factor for PLL1 clock. This parameter must be a number between Min_Data = 1 and Max_Data = 63. In order to save power when PLL1 is not used, the value of PLL1M must be set to 0.

Return value:

- None

Notes:

- This function must be used only when the PLL1 is disabled. PLL1 clock source is common with the main PLL (configured through __HAL_RCC_PLL1_CONFIG() macro)

__HAL_RCC_PLL1_FRACN_CONFIG

Description:

- Macro to configures the main PLL clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLL1FRACN__: specifies Fractional Part Of The Multiplication Factor for PLL1 VCO It should be a value between 0 and 8191

Return value:

- None

Notes:

- These bits can be written at any time, allowing dynamic fine-tuning of the PLL1 VCO
- Warning: The software has to set correctly these bits to insure that the VCO output frequency is between its valid frequency range, which is: 192 to 836 MHz if PLL1VCOSEL = 0 150 to 420 MHz if PLL1VCOSEL = 1.

__HAL_RCC_PLL1_VCIRANGE

Description:

- Macro to select the PLL1 reference frequency range.

Parameters:

- __PLL1VCIRange__: specifies the PLL1 input frequency range This parameter can be one of the following values:
  - RCC_PLL1_VCIRANGE_0: Range frequency is between 1 and 2 MHz
  - RCC_PLL1_VCIRANGE_1: Range frequency is between 2 and 4 MHz
  - RCC_PLL1_VCIRANGE_2: Range frequency is between 4 and 8 MHz
  - RCC_PLL1_VCIRANGE_3: Range frequency is between 8 and 16 MHz

Return value:

- None

__HAL_RCC_PLL1_VCORANGE

Description:

- Macro to select the PLL1 reference frequency range.

Parameters:

- __RCC_PLL1VCORange__: specifies the PLL1 input frequency range This parameter can be one of the following values:
  - RCC_PLL1_VCORANGE_WIDE: Range frequency is between 192 and 836 MHz
  - RCC_PLL1_VCORANGE_MEDIUM: Range frequency is between 150 and 420 MHz

Return value:

- None

__HAL_RCC_GET_PLL1_OSCSOURCE

Description:

- Macro to get the oscillator used as PLL1 clock source.

Return value:

- The: oscillator used as PLL1 clock source. The returned value can be one of the following:
  - RCC_PLL1_SOURCE_NONE: No oscillator is used as PLL clock source.
  - RCC_PLL1_SOURCE_CSI: CSI oscillator is used as PLL clock source.
  - RCC_PLL1_SOURCE_HSI: HSI oscillator is used as PLL clock source.
  - RCC_PLL1_SOURCE_HSE: HSE oscillator is used as PLL clock source.

__HAL_RCC_SYSCLK_CONFIG

Description:

- Macro to configure the system clock source.

Parameters:

- __SYSCLKSOURCE__: specifies the system clock source. This parameter can be one of the following values:
  - RCC_SYSCLKSOURCE_CSI: CSI oscillator is used as system clock source.
  - RCC_SYSCLKSOURCE_HSI: HSI oscillator is used as system clock source.
  - RCC_SYSCLKSOURCE_HSE: HSE oscillator is used as system clock source.
  - RCC_SYSCLKSOURCE_PLL1CLK: PLL1P output is used as system clock source.

Return value:

- None

__HAL_RCC_GET_SYSCLK_SOURCE

Description:

- Macro to get the clock source used as system clock.

Return value:

- The: clock source used as system clock. The returned value can be one of the following:
  - RCC_SYSCLKSOURCE_STATUS_CSI: CSI used as system clock.
  - RCC_SYSCLKSOURCE_STATUS_HSI: HSI used as system clock.
  - RCC_SYSCLKSOURCE_STATUS_HSE: HSE used as system clock.
  - RCC_SYSCLKSOURCE_STATUS_PLL1CLK: PLL1P used as system clock.

__HAL_RCC_LSEDRIVE_CONFIG

Description:

- Macro to configure the External Low Speed oscillator (LSE) drive capability.

Parameters:

- __LSEDRIVE__: specifies the new state of the LSE drive capability. This parameter can be one of the following values:
  - RCC_LSEDRIVE_LOW LSE oscillator low drive capability.
  - RCC_LSEDRIVE_MEDIUMLOW LSE oscillator medium low drive capability.
  - RCC_LSEDRIVE_MEDIUMHIGH LSE oscillator medium high drive capability.
  - RCC_LSEDRIVE_HIGH LSE oscillator high drive capability.

Return value:

- None

Notes:

- As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable the write access using HAL_PWR_EnableBkUpAccess() function before to configure the LSE (to be done once after reset).

__HAL_RCC_WAKEUPSTOP_CLK_CONFIG

Description:

- Macro to configure the wake up from stop clock.

Parameters:

- __STOPWUCLK__: specifies the clock source used after wake up from stop. This parameter can be one of the following values:
  - RCC_STOP_WAKEUPCLOCK_HSI HSI selected as system clock source
  - RCC_STOP_WAKEUPCLOCK_CSI CSI selected as system clock source

Return value:

- None

Notes:

- The configured clock is also used as emergency clock for the Clock Security System on HSE (HSECSS).

__HAL_RCC_HSECSS_RECOVCLK_CONFIG

__HAL_RCC_KERWAKEUPSTOP_CLK_CONFIG

Description:

- Macro to configure the Kernel wake up from stop clock.

Parameters:

- __RCC_STOPKERWUCLK__: specifies the Kernel clock source used after wake up from stop This parameter can be one of the following values:
  - RCC_STOP_KERWAKEUPCLOCK_CSI: CSI selected as Kernel clock source
  - RCC_STOP_KERWAKEUPCLOCK_HSI: HSI selected as Kernel clock source

Return value:

- None

__HAL_RCC_ENABLE_IT

Description:

- Enable RCC interrupt (Perform access to RCC_CIER[8:0] bits to enable the selected interrupts).

Parameters:

- __INTERRUPT__: specifies the RCC interrupt sources to be enabled. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_CSIRDY CSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt (*)
  - RCC_IT_HSECSS HSE Clock security system interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_DISABLE_IT

Description:

- Disable RCC interrupt (Perform access to RCC_CIER[8:0] bits to disable the selected interrupts).

Parameters:

- __INTERRUPT__: specifies the RCC interrupt sources to be disabled. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_CSIRDY CSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt (*)
  - RCC_IT_HSECSS HSE Clock security system interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_CLEAR_IT

Description:

- Clear the RCC's interrupt pending bits (Perform Byte access to RCC_CICR[10:0] bits to clear the selected interrupt pending bits.

Parameters:

- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_CSIRDY CSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt (*)
  - RCC_IT_HSECSS HSE Clock security system interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_GET_IT

Description:

- Check whether the RCC interrupt has occurred or not.

Parameters:

- __INTERRUPT__: specifies the RCC interrupt source to check. This parameter can be one of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_CSIRDY CSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt (*)
  - RCC_IT_HSECSS HSE Clock security system interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RCC_CLEAR_RESET_FLAGS

Description:

- Set RMVF bit to clear the reset flags.

Return value:

- None

__HAL_RCC_GET_FLAG

Description:

- Check whether the selected RCC flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - RCC_FLAG_CSIRDY CSI oscillator clock ready
  - RCC_FLAG_HSIRDY HSI oscillator clock ready
  - RCC_FLAG_HSERDY HSE oscillator clock ready
  - RCC_FLAG_PLL1RDY Main PLL1 clock ready
  - RCC_FLAG_PLL2RDY PLL2 clock ready
  - RCC_FLAG_PLL3RDY PLL3 clock ready (*)
  - RCC_FLAG_HSI48RDY HSI48 clock ready
  - RCC_FLAG_LSERDY LSE oscillator clock ready
  - RCC_FLAG_LSECSSD Clock security system failure on LSE oscillator detection
  - RCC_FLAG_LSIRDY LSI oscillator clock ready
  - RCC_FLAG_HSIDIVF HSI Divider
  - RCC_FLAG_BORRST BOR reset
  - RCC_FLAG_PINRST Pin reset
  - RCC_FLAG_RMVF Remove reset Flag
  - RCC_FLAG_SFTRST Software reset
  - RCC_FLAG_IWDGRST Independent Watchdog reset
  - RCC_FLAG_WWDGRST Window Watchdog reset
  - RCC_FLAG_LPWRRST Low Power reset

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

  Specifies USART6 clock source. This parameter can be a value of ***RCCEx_USART6_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart7ClockSelection***
  Specifies UART7 clock source. This parameter can be a value of ***RCCEx_UART7_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart8ClockSelection***
  Specifies UART8 clock source. This parameter can be a value of ***RCCEx_UART8_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart9ClockSelection***
  Specifies UART9 clock source. This parameter can be a value of ***RCCEx_UART9_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart10ClockSelection***
  Specifies USART10 clock source. This parameter can be a value of ***RCCEx_USART10_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart11ClockSelection***
  Specifies USART11 clock source. This parameter can be a value of ***RCCEx_USART11_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart12ClockSelection***
  Specifies UART12 clock source. This parameter can be a value of ***RCCEx_UART12_Clock_Source***

- ***uint32_t RCC_PeriphCLKInitTypeDef::Lpuart1ClockSelection***
  Specifies LPUART1 clock source. This parameter can be a value of ***RCCEx_LPUART1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c1ClockSelection***
  Specifies I2C1 clock source. This parameter can be a value of ***RCCEx_I2C1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c2ClockSelection***
  Specifies I2C2 clock source. This parameter can be a value of ***RCCEx_I2C2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c3ClockSelection***
  Specifies I2C3 clock source. This parameter can be a value of ***RCCEx_I2C3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c4ClockSelection***
  Specifies I2C4 clock source. This parameter can be a value of ***RCCEx_I2C4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I3c1ClockSelection***
  Specifies I3C1 clock source. This parameter can be a value of ***RCCEx_I3C1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim1ClockSelection***
  Specifies LPTIM1 clock source. This parameter can be a value of ***RCCEx_LPTIM1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim2ClockSelection***
  Specifies LPTIM2 clock source. This parameter can be a value of ***RCCEx_LPTIM2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim3ClockSelection***
  Specifies LPTIM3 clock source. This parameter can be a value of ***RCCEx_LPTIM3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim4ClockSelection***
  Specifies LPTIM4 clock source. This parameter can be a value of ***RCCEx_LPTIM4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim5ClockSelection***
  Specifies LPTIM5 clock source. This parameter can be a value of ***RCCEx_LPTIM5_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim6ClockSelection***
  Specifies LPTIM6 clock source. This parameter can be a value of ***RCCEx_LPTIM6_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::FdcanClockSelection***
  Specifies FDCAN kernel clock source. This parameter can be a value of ***RCCEx_FDCAN_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sai1ClockSelection***
  Specifies SAI1 clock source. This parameter can be a value of ***RCCEx_SAI1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sai2ClockSelection***
  Specifies SAI2 clock source. This parameter can be a value of ***RCCEx_SAI2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::RngClockSelection***
  Specifies RNG clock source. This parameter can be a value of ***RCCEx_RNG_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sdmmc1ClockSelection***
  Specifies SDMMC1 clock source. This parameter can be a value of ***RCCEx_SDMMC1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sdmmc2ClockSelection***
  Specifies SDMMC2 clock source. This parameter can be a value of ***RCCEx_SDMMC2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::AdcDacClockSelection***
  Specifies ADC1, ADC2 and DAC interface clock source. This parameter can be a value of ***RCCEx_ADCDAC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::DacLowPowerClockSelection***
  Specifies DAC low-power clock source used in Sample and hold mode. This parameter can be a value of ***RCCEx_DAC_Low_Power_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::OspiClockSelection***
  Specifies OctoSPI clock source. This parameter can be a value of ***RCCEx_OSPI_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi1ClockSelection***
  Specifies SPI1 clock source. This parameter can be a value of ***RCCEx_SPI1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi2ClockSelection***
  Specifies SPI2 clock source. This parameter can be a value of ***RCCEx_SPI2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi3ClockSelection***
  Specifies SPI3 clock source. This parameter can be a value of ***RCCEx_SPI3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi4ClockSelection***
  Specifies SPI4 clock source. This parameter can be a value of ***RCCEx_SPI4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi5ClockSelection***
  Specifies SPI5 clock source. This parameter can be a value of ***RCCEx_SPI5_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi6ClockSelection***
  Specifies SPI6 clock source. This parameter can be a value of ***RCCEx_SPI6_Clock_Source***

- ***uint32_t RCC_PeriphCLKInitTypeDef::RTCClockSelection***
  Specifies RTC clock source. This parameter can be a value of ***RCC_RTC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::CecClockSelection***
  Specifies CEC clock source. This parameter can be a value of ***RCCEx_CEC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::UsbClockSelection***
  Specifies USB clock source. This parameter can be a value of ***RCCEx_USB_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::TimPresSelection***
  Specifies TIM Clock Prescalers Selection. This parameter can be a value of ***RCCEx_TIM_Prescaler_Selection***

60.1.7 RCC_CRSInitTypeDef

RCC_CRSInitTypeDef is defined in the stm32h5xx_hal_rcc_ex.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t Source***
- ***uint32_t Polarity***
- ***uint32_t ReloadValue***
- ***uint32_t ErrorLimitValue***
- ***uint32_t HSI48CalibrationValue***

Field Documentation

- ***uint32_t RCC_CRSInitTypeDef::Prescaler***
  Specifies the division factor of the SYNC signal. This parameter can be a value of ***RCCEx_CRS_SynchroDivider***
- ***uint32_t RCC_CRSInitTypeDef::Source***
  Specifies the SYNC signal source. This parameter can be a value of ***RCCEx_CRS_SynchroSource***
- ***uint32_t RCC_CRSInitTypeDef::Polarity***
  Specifies the input polarity for the SYNC signal source. This parameter can be a value of ***RCCEx_CRS_SynchroPolarity***
- ***uint32_t RCC_CRSInitTypeDef::ReloadValue***
  Specifies the value to be loaded in the frequency error counter with each SYNC event. It can be calculated in using macro **__HAL_RCC_CRS_RELOADVALUE_CALCULATE(__FTARGET__, __FSYNC__)** This parameter must be a number between 0 and 0xFFFF or a value of ***RCCEx_CRS_ReloadValueDefault*** .
- ***uint32_t RCC_CRSInitTypeDef::ErrorLimitValue***
  Specifies the value to be used to evaluate the captured frequency error value. This parameter must be a number between 0 and 0xFF or a value of ***RCCEx_CRS_ErrorLimitDefault***
- ***uint32_t RCC_CRSInitTypeDef::HSI48CalibrationValue***
  Specifies a user-programmable trimming value to the HSI48 oscillator. This parameter must be a number between 0 and 0x7F or a value of ***RCCEx_CRS_HSI48CalibrationDefault***

60.1.8 RCC_CRSSynchroInfoTypeDef

RCC_CRSSynchroInfoTypeDef is defined in the stm32h5xx_hal_rcc_ex.h

Data Fields

- ***uint32_t ReloadValue***
- ***uint32_t HSI48CalibrationValue***
- ***uint32_t FreqErrorCapture***
- ***uint32_t FreqErrorDirection***

Field Documentation

- ***uint32_t RCC_CRSSynchroInfoTypeDef::ReloadValue***
  Specifies the value loaded in the Counter reload value. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t RCC_CRSSynchroInfoTypeDef::HSI48CalibrationValue***
  Specifies value loaded in HSI48 oscillator smooth trimming. This parameter must be a number between 0 and 0x3F

- ***uint32_t RCC_CRSSynchroInfoTypeDef::FreqErrorCapture***
  Specifies the value loaded in the .FECAP, the frequency error counter value latched in the time of the last SYNC event. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t RCC_CRSSynchroInfoTypeDef::FreqErrorDirection***
  Specifies the value loaded in the .FEDIR, the counting direction of the frequency error counter latched in the time of the last SYNC event. It shows whether the actual frequency is below or above the target. This parameter must be a value of ***RCCEx_CRS_FreqErrorDirection***

60.2 RCCEx Firmware driver API description

The following section lists the various functions of the RCCEx library.

60.2.1 Extended Peripheral Control functions

This subsection provides a set of functions allowing to control the RCC Clocks frequencies.

Note: *Important note: Care must be taken when HAL_RCCEx_PeriphCLKConfig() is used to select the RTC clock source; in this case the Backup domain will be reset in order to modify the RTC Clock source, as consequence RTC registers (including the backup registers) are set to their reset values.*

This section contains the following APIs:

- ***HAL_RCCEx_PeriphCLKConfig()***
- ***HAL_RCCEx_GetPeriphCLKConfig()***
- ***HAL_RCCEx_GetPLL1ClockFreq()***
- ***HAL_RCCEx_GetPLL2ClockFreq()***
- ***HAL_RCCEx_GetPLL3ClockFreq()***
- ***HAL_RCCEx_GetPeriphCLKFreq()***

60.2.2 Extended clock management functions

This subsection provides a set of functions allowing to control the activation or deactivation of PLL2, PLL3, LSE CSS, Low speed clock output and clock after wake-up from STOP mode.

This section contains the following APIs:

- ***HAL_RCCEx_EnablePLL2()***
- ***HAL_RCCEx_DisablePLL2()***
- ***HAL_RCCEx_EnablePLL3()***
- ***HAL_RCCEx_DisablePLL3()***
- ***HAL_RCCEx_WakeUpStopCLKConfig()***
- ***HAL_RCCEx_KerWakeUpStopCLKConfig()***
- ***HAL_RCCEx_EnableLSECSS()***
- ***HAL_RCCEx_DisableLSECSS()***
- ***HAL_RCCEx_LSECSS_IRQHandler()***
- ***HAL_RCCEx_LSECSS_Callback()***
- ***HAL_RCCEx_EnableLSCO()***
- ***HAL_RCCEx_DisableLSCO()***

60.2.3 Extended Clock Recovery System Control functions

For devices with Clock Recovery System feature (CRS), RCC Extension HAL driver can be used as follows:

1. In System clock config, HSI48 needs to be enabled
2. Enable CRS clock in IP MSP init which will use CRS functions

3. Call CRS functions as follows:
   a. Prepare synchronization configuration necessary for HSI48 calibration
      - Default values can be set for frequency Error Measurement (reload and error limit) and also HSI48 oscillator smooth trimming.
      - Macro __HAL_RCC_CRS_RELOADVALUE_CALCULATE can be also used to calculate directly reload value with target and synchronization frequencies values
   b. Call function HAL_RCCEx_CRSConfig which
      - Resets CRS registers to their default values.
      - Configures CRS registers with synchronization configuration
      - Enables automatic calibration and frequency error counter feature Note: When using USB LPM (Link Power Management) and the device is in Sleep mode, the periodic USB SOF will not be generated by the host. No SYNC signal will therefore be provided to the CRS to calibrate the HSI48 on the run. To guarantee the required clock precision after waking up from Sleep mode, the LSE or reference clock on the GPIOs should be used as SYNC signal.
   c. A polling function is provided to wait for complete synchronization
      - Call function HAL_RCCEx_CRSWaitSynchronization()
      - According to CRS status, user can decide to adjust again the calibration or continue application if synchronization is OK
4. User can retrieve information related to synchronization in calling function HAL_RCCEx_CRSGetSynchronizationInfo()
5. Regarding synchronization status and synchronization information, user can try a new calibration in changing synchronization configuration and call again HAL_RCCEx_CRSConfig. Note: When the SYNC event is detected during the downcounting phase (before reaching the zero value), it means that the actual frequency is lower than the target (and so, that the TRIM value should be incremented), while when it is detected during the upcounting phase it means that the actual frequency is higher (and that the TRIM value should be decremented).
6. In interrupt mode, user can resort to the available macros (__HAL_RCC_CRS_XXX_IT). Interrupts will go through CRS Handler (CRS_IRQn/CRS_IRQHandler)
   – Call function HAL_RCCEx_CRSConfig()
   – Enable CRS_IRQn (thanks to NVIC functions)
   – Enable CRS interrupt (__HAL_RCC_CRS_ENABLE_IT)
   – Implement CRS status management in the following user callbacks called from HAL_RCCEx_CRS_IRQHandler():
      - HAL_RCCEx_CRS_SyncOkCallback()
      - HAL_RCCEx_CRS_SyncWarnCallback()
      - HAL_RCCEx_CRS_ExpectedSyncCallback()
      - HAL_RCCEx_CRS_ErrorCallback()
7. To force a SYNC EVENT, user can use the function HAL_RCCEx_CRSSoftwareSynchronizationGenerate(). This function can be called before calling HAL_RCCEx_CRSConfig (for instance in Systick handler)

This section contains the following APIs:

- ***HAL_RCCEx_CRSConfig()***
- ***HAL_RCCEx_CRSSoftwareSynchronizationGenerate()***
- ***HAL_RCCEx_CRSGetSynchronizationInfo()***
- ***HAL_RCCEx_CRSWaitSynchronization()***
- ***HAL_RCCEx_CRS_IRQHandler()***
- ***HAL_RCCEx_CRS_SyncOkCallback()***
- ***HAL_RCCEx_CRS_SyncWarnCallback()***
- ***HAL_RCCEx_CRS_ExpectedSyncCallback()***
- ***HAL_RCCEx_CRS_ErrorCallback()***

60.2.4 Detailed description of functions

HAL_RCCEx_PeriphCLKConfig

Function name

HAL_StatusTypeDef HAL_RCCEx_PeriphCLKConfig (const RCC_PeriphCLKInitTypeDef * pPeriphClkInit)

Function description

Initialize the RCC extended peripherals clocks according to the specified parameters in the RCC_PeriphCLKInitTypeDef.

Parameters

- **pPeriphClkInit:** pointer to an RCC_PeriphCLKInitTypeDef structure that contains a field PeriphClockSelection which can be a combination of the following values:
  - RCC_PERIPHCLK_USART1 USART1 peripheral clock
  - RCC_PERIPHCLK_USART2 USART2 peripheral clock
  - RCC_PERIPHCLK_USART3 USART3 peripheral clock
  - RCC_PERIPHCLK_UART4 UART4 peripheral clock (*)
  - RCC_PERIPHCLK_UART5 UART5 peripheral clock (*)
  - RCC_PERIPHCLK_USART6 USART6 peripheral clock (*)
  - RCC_PERIPHCLK_UART7 UART7 peripheral clock (*)
  - RCC_PERIPHCLK_UART8 UART8 peripheral clock (*)
  - RCC_PERIPHCLK_UART9 UART9 peripheral clock (*)
  - RCC_PERIPHCLK_USART10 USART10 peripheral clock (*)
  - RCC_PERIPHCLK_USART11 USART11 peripheral clock (*)
  - RCC_PERIPHCLK_UART12 UART12 peripheral clock (*)
  - RCC_PERIPHCLK_LPUART1 LPUART1 peripheral clock
  - RCC_PERIPHCLK_I2C1 I2C1 peripheral clock
  - RCC_PERIPHCLK_I2C2 I2C2 peripheral clock
  - RCC_PERIPHCLK_I2C3 I2C3 peripheral clock (*)
  - RCC_PERIPHCLK_I2C4 I2C4 peripheral clock (*)
  - RCC_PERIPHCLK_I3C1 I3C1 peripheral clock
  - RCC_PERIPHCLK_I3C2 I3C2 peripheral clock (***)
  - RCC_PERIPHCLK_LPTIM1 LPTIM1 peripheral clock
  - RCC_PERIPHCLK_LPTIM2 LPTIM2 peripheral clock
  - RCC_PERIPHCLK_SAI1 SAI1 peripheral clock (*)
  - RCC_PERIPHCLK_SAI2 SAI2 peripheral clock (*)
  - RCC_PERIPHCLK_ADCDAC ADCDAC peripheral clock
  - RCC_PERIPHCLK_ADC ADC peripheral clock
  - RCC_PERIPHCLK_SDMMC1 SDMMC1 peripheral clock (*)
  - RCC_PERIPHCLK_SDMMC2 SDMMC2 peripheral clock (**)
  - RCC_PERIPHCLK_CKPER CKPER peripheral clock
  - RCC_PERIPHCLK_RTC RTC peripheral clock
  - RCC_PERIPHCLK_RNG RNG peripheral clock
  - RCC_PERIPHCLK_SPI1 SPI1 peripheral clock
  - RCC_PERIPHCLK_SPI2 SPI2 peripheral clock
  - RCC_PERIPHCLK_SPI3 SPI3 peripheral clock
  - RCC_PERIPHCLK_SPI4 SPI4 peripheral clock (*)
  - RCC_PERIPHCLK_SPI5 SPI5 peripheral clock (*)
  - RCC_PERIPHCLK_SPI6 SPI6 peripheral clock (*)
  - RCC_PERIPHCLK_OSPI OCTOSPI peripheral clock (*)
  - RCC_PERIPHCLK_FDCAN FDCAN peripheral clock
  - RCC_PERIPHCLK_CEC CEC peripheral clock (*)
  - RCC_PERIPHCLK_USB USB peripheral clock
  - RCC_PERIPHCLK_LPTIM3 LPTIM3 peripheral clock (*)
  - RCC_PERIPHCLK_LPTIM4 LPTIM4 peripheral clock (*)
  - RCC_PERIPHCLK_LPTIM5 LPTIM5 peripheral clock (*)
  - RCC_PERIPHCLK_LPTIM6 LPTIM6 peripheral clock (*)
  - RCC_PERIPHCLK_DAC_LP DAC peripheral low-power clock
  - RCC_PERIPHCLK_TIM TIM peripheral clock

Return values

- **HAL:** status

Notes

- Care must be taken when HAL_RCCEx_PeriphCLKConfig() is used to select the RTC clock source: in this case the access to Backup domain is enabled.

HAL_RCCEx_GetPeriphCLKConfig

Function name

void HAL_RCCEx_GetPeriphCLKConfig (RCC_PeriphCLKInitTypeDef * pPeriphClkInit)

Function description

Get the pPeriphClkInit according to the internal RCC configuration registers.

Parameters

- **pPeriphClkInit:** pointer to an RCC_PeriphCLKInitTypeDef structure that returns the configuration information for the Extended Peripherals clocks (ADC12, DAC, SDMMC1, SDMMC2, OCTOSPI1, TIM, LPTIM1, LPTIM2, LPTIM3, LPTIM4, LPTIM5, LPTIM6, SPI1, SPI2, SPI3, SPI4, SPI5, SPI6, USART1, USART2, USART3, UART4, UART5, USART6, UART7, UART8, UART9, USART10, USART11, UART12, LPUART1, I2C1, I2C2, I2C3, I2C4, I3C1, I3C2, CEC, FDCAN, SAI1, SAI2, USB,), PLL2 and PLL3.

Return values

- **None:**

HAL_RCCEx_GetPeriphCLKFreq

Function name

uint32_t HAL_RCCEx_GetPeriphCLKFreq (uint64_t PeriphClk)

Function description

Return the peripheral clock frequency for peripherals.

Parameters

- **PeriphClk:** Peripheral clock identifier This parameter can be one of the following values:
  - RCC_PERIPHCLK_USART1 USART1 peripheral clock
  - RCC_PERIPHCLK_USART2 USART2 peripheral clock
  - RCC_PERIPHCLK_USART3 USART3 peripheral clock
  - RCC_PERIPHCLK_UART4 UART4 peripheral clock (*)
  - RCC_PERIPHCLK_UART5 UART5 peripheral clock (*)
  - RCC_PERIPHCLK_USART6 USART6 peripheral clock (*)
  - RCC_PERIPHCLK_UART7 UART7 peripheral clock (*)
  - RCC_PERIPHCLK_UART8 UART8 peripheral clock (*)
  - RCC_PERIPHCLK_UART9 UART9 peripheral clock (*)
  - RCC_PERIPHCLK_USART10 USART10 peripheral clock (*)
  - RCC_PERIPHCLK_USART11 USART11 peripheral clock (*)
  - RCC_PERIPHCLK_UART12 UART12 peripheral clock (*)
  - RCC_PERIPHCLK_LPUART1 LPUART1 peripheral clock
  - RCC_PERIPHCLK_I2C1 I2C1 peripheral clock
  - RCC_PERIPHCLK_I2C2 I2C2 peripheral clock
  - RCC_PERIPHCLK_I2C3 I2C3 peripheral clock (*)
  - RCC_PERIPHCLK_I2C4 I2C4 peripheral clock (*)
  - RCC_PERIPHCLK_I3C1 I3C1 peripheral clock
  - RCC_PERIPHCLK_I3C2 I3C2 peripheral clock (***)
  - RCC_PERIPHCLK_LPTIM1 LPTIM1 peripheral clock
  - RCC_PERIPHCLK_LPTIM2 LPTIM2 peripheral clock
  - RCC_PERIPHCLK_SAI1 SAI1 peripheral clock (*)
  - RCC_PERIPHCLK_SAI2 SAI2 peripheral clock (*)
  - RCC_PERIPHCLK_ADCDAC ADCDAC peripheral clock
  - RCC_PERIPHCLK_ADC ADC peripheral clock
  - RCC_PERIPHCLK_SDMMC1 SDMMC1 peripheral clock (*)
  - RCC_PERIPHCLK_SDMMC2 SDMMC2 peripheral clock (**)
  - RCC_PERIPHCLK_CKPER CKPER peripheral clock
  - RCC_PERIPHCLK_RTC RTC peripheral clock
  - RCC_PERIPHCLK_RNG RNG peripheral clock
  - RCC_PERIPHCLK_SPI1 SPI1 peripheral clock
  - RCC_PERIPHCLK_SPI2 SPI2 peripheral clock
  - RCC_PERIPHCLK_SPI3 SPI3 peripheral clock
  - RCC_PERIPHCLK_SPI4 SPI4 peripheral clock (*)
  - RCC_PERIPHCLK_SPI5 SPI5 peripheral clock (*)
  - RCC_PERIPHCLK_SPI6 SPI6 peripheral clock (*)
  - RCC_PERIPHCLK_OSPI OCTOSPI peripheral clock (*)
  - RCC_PERIPHCLK_FDCAN FDCAN peripheral clock
  - RCC_PERIPHCLK_CEC CEC peripheral clock (*)
  - RCC_PERIPHCLK_USB USB peripheral clock
  - RCC_PERIPHCLK_LPTIM3 LPTIM3 peripheral clock (*)
  - RCC_PERIPHCLK_LPTIM4 LPTIM4 peripheral clock (*)
  - RCC_PERIPHCLK_LPTIM5 LPTIM5 peripheral clock (*)
  - RCC_PERIPHCLK_LPTIM6 LPTIM6 peripheral clock (*)
  - RCC_PERIPHCLK_DAC_LP DAC low-power peripheral clock
  - RCC_PERIPHCLK_TIM TIM peripheral clock

Return values

- **Frequency:** in Hz

Notes

- Return 0 if peripheral clock identifier not managed by this API

HAL_RCCEx_GetPLL1ClockFreq

Function name

void HAL_RCCEx_GetPLL1ClockFreq (PLL1_ClocksTypeDef * pPLL1_Clocks)

Function description

Returns the PLL1 clock frequencies : PLL1_P_Frequency, PLL1_R_Frequency and PLL1_Q_Frequency.

Parameters

- **pPLL1_Clocks:** pointer to PLL1_ClocksTypeDef structure.

Return values

- **None:**

Notes

- The PLL1 clock frequencies computed by this function may not be the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:
- The function returns values based on HSE_VALUE, HSI_VALUE or CSI Value multiplied/divided by the PLL factors.
- This function can be used by the user application to compute the baud-rate for the communication peripherals or configure other parameters.
- Each time PLL1CLK changes, this function must be called to update the right PLL1CLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCCEx_GetPLL2ClockFreq

Function name

void HAL_RCCEx_GetPLL2ClockFreq (PLL2_ClocksTypeDef * pPLL2_Clocks)

Function description

Returns the PLL2 clock frequencies: PLL2_P_Frequency, PLL2_R_Frequency and PLL2_Q_Frequency.

Parameters

- **pPLL2_Clocks:** pointer to PLL2_ClocksTypeDef structure.

Return values

- **None:**

Notes

- The PLL2 clock frequencies computed by this function may not be the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:
- The function returns values based on HSE_VALUE, HSI_VALUE or CSI Value multiplied/divided by the PLL factors.
- This function can be used by the user application to compute the baud-rate for the communication peripherals or configure other parameters.
- Each time PLL2CLK changes, this function must be called to update the right PLL2CLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCCEx_GetPLL3ClockFreq

Function name

void HAL_RCCEx_GetPLL3ClockFreq (PLL3_ClocksTypeDef * pPLL3_Clocks)

Function description

Returns the PLL3 clock frequencies: PLL3_P_Frequency, PLL3_R_Frequency and PLL3_Q_Frequency.

Parameters

- **pPLL3_Clocks:** pointer to PLL3_ClocksTypeDef structure.

Return values

- **None:**

Notes

- The PLL3 clock frequencies computed by this function may not be the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:
- The function returns values based on HSE_VALUE, HSI_VALUE or CSI Value multiplied/divided by the PLL factors.
- This function can be used by the user application to compute the baud-rate for the communication peripherals or configure other parameters.
- Each time PLL3CLK changes, this function must be called to update the right PLL3CLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCCEx_EnablePLL2

Function name

HAL_StatusTypeDef HAL_RCCEx_EnablePLL2 (RCC_PLL2InitTypeDef * pPLL2Init)

Function description

Initialize and Enable the PLL2 according to the specified parameters in the RCC_PLL2InitTypeDef.

Parameters

- **pPLL2Init:** pointer to an RCC_PLL2InitTypeDef structure that contains the configuration information for the PLL2

Return values

- **HAL:** status

HAL_RCCEx_DisablePLL2

Function name

HAL_StatusTypeDef HAL_RCCEx_DisablePLL2 (void)

Function description

Disable PLL2.

Return values

- **HAL:** status

HAL_RCCEx_EnablePLL3

Function name

HAL_StatusTypeDef HAL_RCCEx_EnablePLL3 (RCC_PLL3InitTypeDef * pPLL3Init)

Function description

Initialize and Enable the PLL3 according to the specified parameters in the RCC_PLL3InitTypeDef.

Parameters

- **pPLL3Init:** pointer to an RCC_PLL3InitTypeDef structure that contains the configuration information for the PLL3

Return values

- **HAL:** status.

HAL_RCCEx_DisablePLL3

Function name

HAL_StatusTypeDef HAL_RCCEx_DisablePLL3 (void)

Function description

Disable PLL3.

Return values

- **HAL:** status.

HAL_RCCEx_WakeUpStopCLKConfig

Function name

void HAL_RCCEx_WakeUpStopCLKConfig (uint32_t WakeUpClk)

Function description

Configure the oscillator clock source for wakeup from Stop and HSE CSS backup clock.

Parameters

- **WakeUpClk:** Wakeup clock This parameter can be one of the following values:
  - RCC_STOP_WAKEUPCLOCK_HSI HSI oscillator selection
  - RCC_STOP_WAKEUPCLOCK_CSI CSI oscillator selection

Return values

- **None:**

Notes

- This function shall not be called after the Clock Security System on HSE has been enabled.

HAL_RCCEx_KerWakeUpStopCLKConfig

Function name

void HAL_RCCEx_KerWakeUpStopCLKConfig (uint32_t WakeUpClk)

Function description

Configure the oscillator Kernel clock source for wakeup from Stop.

Parameters

- **WakeUpClk:** Kernel Wakeup clock This parameter can be one of the following values:
  - RCC_STOP_KERWAKEUPCLOCK_HSI: HSI oscillator selection
  - RCC_STOP_KERWAKEUPCLOCK_CSI: CSI oscillator selection

Return values

- **None:**

HAL_RCCEx_EnableLSECSS

Function name

void HAL_RCCEx_EnableLSECSS (void)

Function description

Enable the LSE Clock Security System.

Return values

- **None:**

Notes

- Prior to enable the LSE Clock Security System, LSE oscillator is to be enabled with HAL_RCC_OscConfig() and the LSE oscillator clock is to be selected as RTC clock with HAL_RCCEx_PeriphCLKConfig().

HAL_RCCEx_DisableLSECSS

Function name

void HAL_RCCEx_DisableLSECSS (void)

Function description

Disable the LSE Clock Security System.

Return values

- **None:**

Notes

- LSE Clock Security System can only be disabled after a LSE failure detection.

HAL_RCCEx_LSECSS_IRQHandler

Function name

void HAL_RCCEx_LSECSS_IRQHandler (void)

Function description

Handle the RCC LSE Clock Security System interrupt request.

Return values

- **None:**

HAL_RCCEx_LSECSS_Callback

Function name

void HAL_RCCEx_LSECSS_Callback (void)

Function description

RCCEx LSE Clock Security System interrupt callback.

Return values

- **none:**

HAL_RCCEx_EnableLSCO

Function name

void HAL_RCCEx_EnableLSCO (uint32_t LSCOSource)

Function description

Select the Low Speed Microcontroller Clock source to output on LSCO pin (PB2).

Parameters

- **LSCOSource:** specifies the Low Speed clock source to output. This parameter can be one of the following values:
  - RCC_LSCOSOURCE_LSI LSI clock selected as LSCO source
  - RCC_LSCOSOURCE_LSE LSE clock selected as LSCO source

Return values

- **None:**

HAL_RCCEx_DisableLSCO

Function name

void HAL_RCCEx_DisableLSCO (void)

Function description

Disable the Low Speed Microcontroller Clock Output.

Return values

- **None:**

HAL_RCCEx_CRSConfig

Function name

void HAL_RCCEx_CRSConfig (const RCC_CRSInitTypeDef * pInit)

Function description

Start automatic synchronization for polling mode.

Parameters

- **pInit:** Pointer on RCC_CRSInitTypeDef structure

Return values

- **None:**

HAL_RCCEx_CRSSoftwareSynchronizationGenerate

Function name

void HAL_RCCEx_CRSSoftwareSynchronizationGenerate (void)

Function description

Generate the software synchronization event.

Return values

- **None:**

HAL_RCCEx_CRSGetSynchronizationInfo

Function name

void HAL_RCCEx_CRSGetSynchronizationInfo (RCC_CRSSynchroInfoTypeDef * pSynchroInfo)

Function description

Return synchronization info.

Parameters

- **pSynchroInfo:** Pointer on RCC_CRSSynchroInfoTypeDef structure

Return values

- **None:**

HAL_RCCEx_CRSWaitSynchronization

Function name

uint32_t HAL_RCCEx_CRSWaitSynchronization (uint32_t Timeout)

Function description

Wait for CRS Synchronization status.

Parameters

- **Timeout:** Duration of the timeout

Return values

- **Combination:** of Synchronization status This parameter can be a combination of the following values:
  - RCC_CRS_TIMEOUT
  - RCC_CRS_SYNCOK
  - RCC_CRS_SYNCWARN
  - RCC_CRS_SYNCERR
  - RCC_CRS_SYNCMISS
  - RCC_CRS_TRIMOVF

Notes

- Timeout is based on the maximum time to receive a SYNC event based on synchronization frequency.
- If Timeout set to HAL_MAX_DELAY, HAL_TIMEOUT will be never returned.

HAL_RCCEx_CRS_IRQHandler

Function name

void HAL_RCCEx_CRS_IRQHandler (void)

Function description

Handle the Clock Recovery System interrupt request.

Return values

- **None:**

HAL_RCCEx_CRS_SyncOkCallback

Function name

void HAL_RCCEx_CRS_SyncOkCallback (void)

Function description

RCCEx Clock Recovery System SYNCOK interrupt callback.

Return values

- **none:**

HAL_RCCEx_CRS_SyncWarnCallback

Function name

void HAL_RCCEx_CRS_SyncWarnCallback (void)

Function description

RCCEx Clock Recovery System SYNCWARN interrupt callback.

Return values

- **none:**

HAL_RCCEx_CRS_ExpectedSyncCallback

Function name

void HAL_RCCEx_CRS_ExpectedSyncCallback (void)

Function description

RCCEx Clock Recovery System Expected SYNC interrupt callback.

Return values

- **none:**

HAL_RCCEx_CRS_ErrorCallback

Function name

void HAL_RCCEx_CRS_ErrorCallback (uint32_t Error)

Function description

RCCEx Clock Recovery System Error interrupt callback.

Parameters

- **Error:** Combination of Error status. This parameter can be a combination of the following values:
  - RCC_CRS_SYNCERR
  - RCC_CRS_SYNCMISS
  - RCC_CRS_TRIMOVF

Return values

- **none:**

60.3 RCCEx Firmware driver defines

The following section lists the various define and macros of the module.

60.3.1 RCCEx

RCCEx

ADCDAC Kernel Clock Source

RCC_ADCDACCLKSOURCE_HCLK

RCC_ADCDACCLKSOURCE_SYSCLK

RCC_ADCDACCLKSOURCE_PLL2R

RCC_ADCDACCLKSOURCE_HSE

RCC_ADCDACCLKSOURCE_HSI

RCC_ADCDACCLKSOURCE_CSI

CEC Clock Source

RCC_CECCLKSOURCE_LSE

RCC_CECCLKSOURCE_LSI

RCC_CECCLKSOURCE_CSI_DIV122

RCCEx CLKP Clock Source

RCC_CLKPSOURCE_HSI

RCC_CLKPSOURCE_CSI

RCC_CLKPSOURCE_HSE

RCCEx CRS ErrorLimitDefault

RCC_CRS_ERRORLIMIT_DEFAULT

Default Frequency error limit

RCCEx CRS Extended Features

__HAL_RCC_CRS_FREQ_ERROR_COUNTER_ENABLE

Description:

- Enable the oscillator clock for frequency error counter.

Return value:

- None

Notes:

- when the CEN bit is set the CRS_CFGR register becomes write-protected.

__HAL_RCC_CRS_FREQ_ERROR_COUNTER_DISABLE

Description:

- Disable the oscillator clock for frequency error counter.

Return value:

- None

__HAL_RCC_CRS_AUTOMATIC_CALIB_ENABLE

Description:

- Enable the automatic hardware adjustment of TRIM bits.

Return value:

- None

Notes:

- When the AUTOTRIMEN bit is set the CRS_CFGR register becomes write-protected.

__HAL_RCC_CRS_AUTOMATIC_CALIB_DISABLE

Description:

- Enable or disable the automatic hardware adjustment of TRIM bits.

Return value:

- None

__HAL_RCC_CRS_RELOADVALUE_CALCULATE

Description:

- Macro to calculate reload value to be set in CRS register according to target and sync frequencies.

Parameters:

- __FTARGET__: Target frequency (value in Hz)
- __FSYNC__: Synchronization signal frequency (value in Hz)

Return value:

- None

Notes:

- The RELOAD value should be selected according to the ratio between the target frequency and the frequency of the synchronization source after prescaling. It is then decreased by one in order to reach the expected synchronization on the zero value. The formula is the following: RELOAD = (fTARGET / fSYNC) -1

RCCEx CRS Flags

RCC_CRS_FLAG_SYNCOK

SYNC event OK flag

RCC_CRS_FLAG_SYNCWARN

SYNC warning flag

RCC_CRS_FLAG_ERR

Error flag

RCC_CRS_FLAG_ESYNC

Expected SYNC flag

RCC_CRS_FLAG_SYNCERR

SYNC error

RCC_CRS_FLAG_SYNCMISS

SYNC missed

RCC_CRS_FLAG_TRIMOVF

Trimming overflow or underflow

RCCEx CRS FreqErrorDirection

RCC_CRS_FREQERRORDIR_UP

Upcounting direction, the actual frequency is above the target

RCC_CRS_FREQERRORDIR_DOWN

Downcounting direction, the actual frequency is below the target

RCCEx CRS HSI48CalibrationDefault

RCC_CRS_HSI48CALIBRATION_DEFAULT

The default value is 32, which corresponds to the middle of the trimming interval. The trimming step is around 67 kHz between two consecutive TRIM steps. A higher TRIM value corresponds to a higher output frequency

RCCEx CRS Interrupt Sources

RCC_CRS_IT_SYNCOK

SYNC event OK

RCC_CRS_IT_SYNCWARN

SYNC warning

RCC_CRS_IT_ERR

Error

RCC_CRS_IT_ESYNC

Expected SYNC

RCC_CRS_IT_SYNCERR

SYNC error

RCC_CRS_IT_SYNCMISS

SYNC missed

RCC_CRS_IT_TRIMOVF

Trimming overflow or underflow

RCCEx CRS ReloadValueDefault

RCC_CRS_RELOADVALUE_DEFAULT

The reset value of the RELOAD field corresponds to a target frequency of 48 MHz and a synchronization signal frequency of 1 kHz (SOF signal from USB).

RCCEx CRS Status

RCC_CRS_NONE

RCC_CRS_TIMEOUT

RCC_CRS_SYNCOK

RCC_CRS_SYNCWARN

RCC_CRS_SYNCERR

RCC_CRS_SYNCMISS

RCC_CRS_TRIMOVF

RCCEx CRS SynchroDivider

RCC_CRS_SYNC_DIV1

Synchro Signal not divided (default)

RCC_CRS_SYNC_DIV2

Synchro Signal divided by 2

RCC_CRS_SYNC_DIV4

Synchro Signal divided by 4

RCC_CRS_SYNC_DIV8

Synchro Signal divided by 8

RCC_CRS_SYNC_DIV16

Synchro Signal divided by 16

RCC_CRS_SYNC_DIV32

Synchro Signal divided by 32

RCC_CRS_SYNC_DIV64

Synchro Signal divided by 64

RCC_CRS_SYNC_DIV128

Synchro Signal divided by 128

RCCEx CRS SynchroPolarity

RCC_CRS_SYNC_POLARITY_RISING

Synchro Active on rising edge (default)

RCC_CRS_SYNC_POLARITY_FALLING

Synchro Active on falling edge

RCCEx CRS SynchroSource

RCC_CRS_SYNC_SOURCE_GPIO

Synchro Signal source GPIO

RCC_CRS_SYNC_SOURCE_LSE

Synchro Signal source LSE

RCC_CRS_SYNC_SOURCE_USB

Synchro Signal source USB SOF (default)

DAC Low Power Kernel Clock Source

RCC_DACLPCLKSOURCE_LSE

RCC_DACLPCLKSOURCE_LSI

RCCEx Exported Macros

__HAL_RCC_TIMIC_ENABLE

Description:

- Macros to enable or disable the HSI and CSI divided clock for Timers 12, 15 and LPTimer2 input capture.

Return value:

- None: HSI/1024, CSI/128 and HSI/8 generation for Timers 12,15 and LPTimer2 Input capture

Notes:

- HSI and CSI clocks without division are available when TIMIC is enabled

__HAL_RCC_TIMIC_DISABLE

No clock available for Timers Input capture

__HAL_RCC_PLL2_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL2 clock source.

Parameters:

- __PLL2SOURCE__: specifies the PLL2 entry clock source. This parameter can be one of the following values:
  - RCC_PLL2_SOURCE_NONE: No oscillator clock selected as PLL2 clock entry
  - RCC_PLL2_SOURCE_CSI: CSI oscillator clock selected as PLL2 clock entry
  - RCC_PLL2_SOURCE_HSI: HSI oscillator clock selected as PLL2 clock entry
  - RCC_PLL2_SOURCE_HSE: HSE oscillator clock selected as PLL2 clock entry

Notes:

- This function must be used only when all PLL2 is disabled.

__HAL_RCC_GET_PLL2_OSCSOURCE

Description:

- Macro to get the oscillator used as PLL2 clock source.

Return value:

- The: oscillator used as PLL2 clock source. The returned value can be one of the following:
  - RCC_PLL2_SOURCE_NONE: No oscillator is used as PLL clock source.
  - RCC_PLL2_SOURCE_CSI: CSI oscillator is used as PLL clock source.
  - RCC_PLL2_SOURCE_HSI: HSI oscillator is used as PLL clock source.
  - RCC_PLL2_SOURCE_HSE: HSE oscillator is used as PLL clock source.

__HAL_RCC_PLL2_CONFIG

Description:

- Macro to configures the PLL2 source, multiplication and division factors.

Parameters:

- __PLL2SOURCE__: specifies the PLL2 entry clock source. This parameter can be one of the following values:
  - RCC_PLL2_SOURCE_NONE No clock selected as PLL2 clock entry
  - RCC_PLL2_SOURCE_CSI CSI oscillator clock selected as PLL2 clock entry
  - RCC_PLL2_SOURCE_HSI HSI oscillator clock selected as PLL2 clock entry
  - RCC_PLL2_SOURCE_HSE HSE oscillator clock selected as PLL2 clock entry
- __PLL2M__: specifies the division factor of PLL2 input clock. This parameter must be a number between Min_Data = 1 and Max_Data = 63.
- __PLL2N__: specifies the multiplication factor for PLL2 VCO output clock This parameter must be a number between 4 and 512.
- __PLL2P__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128
- __PLL2Q__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128
- __PLL2R__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128

Return value:

- None

Notes:

- This function must be used only when PLL2 is disabled.
- You have to set the PLL2N parameter correctly to ensure that the VCO output frequency is between 192 and 836 MHz (Wide range) or 150 and 420 Mhz (Medium range). PLL2 clock frequency = f(PLL2) multiplied by PLL2N

__HAL_RCC_PLL2_MULN_CONFIG

Description:

- Macro to configure the PLL2 clock multiplication factor N.

Parameters:

- __PLL2N__: specifies the multiplication factor for PLL2 VCO output clock. This parameter must be a number between 4 and 512.

Return value:

- None

Notes:

- This function must be used only when the PLL2 is disabled. PLL2 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL2_CONFIG() macro.
- You have to set the PLL2N parameter correctly to ensure that the VCO output frequency is between 192 and 836 MHz (Wide range) or 150 and 420 Mhz (Medium range). PLL2 clock frequency = f(PLL2) multiplied by PLL2N

__HAL_RCC_PLL2_DIVM_CONFIG

Description:

- Macro to configure the PLL2 input clock division factor M.

Parameters:

- __PLL2M__: specifies the division factor for PLL2 clock. This parameter must be a number between Min_Data = 1 and Max_Data = 63. In order to save power when PLL2 is not used, the value of PLL2M must be set to 0.

Return value:

- None

Notes:

- This function must be used only when the PLL2 is disabled. PLL2 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL2_CONFIG() macro.

__HAL_RCC_PLL2_DIVP_CONFIG

Description:

- Macro to configure the PLL2 clock division factor P.

Parameters:

- __PLL2P__: specifies the division factor for PLL2 output P clock. This parameter must be a number in the range (1 to 128). Use to set PLL2 output P clock frequency = f(PLL2) / PLL2P

Return value:

- None

Notes:

- This function must be used only when the PLL2 is disabled. PLL2 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL2_CONFIG() macro.

__HAL_RCC_PLL2_DIVQ_CONFIG

Description:

- Macro to configure the PLL2 clock division factor Q.

Parameters:

- __PLL2Q__: specifies the division factor for PLL2 output Q clock. This parameter must be a number in the range (1 to 128). Use to set PLL2 output Q clock frequency = f(PLL2) / PLL2Q

Return value:

- None

Notes:

- This function must be used only when the PLL2 is disabled. PLL2 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL2_CONFIG() macro.

__HAL_RCC_PLL2_DIVR_CONFIG

Description:

- Macro to configure the PLL2 clock division factor R.

Parameters:

- __PLL2R__: specifies the division factor for PLL2 output R clock. This parameter must be a number in the range (1 to 128). Use to set PLL2 output R clock frequency = f(PLL2) / PLL2R

Return value:

- None

Notes:

- This function must be used only when the PLL2 is disabled. PLL2 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL2_CONFIG() macro.

__HAL_RCC_PLL2_ENABLE

Description:

- Macros to enable or disable the PLL2.

Return value:

- None

Notes:

- After enabling PLL2, the application software should wait on PLL2RDY flag to be set indicating that PLL2 clock is stable and can be used as kernel clock source. The PLL2 is disabled by hardware when entering STOP and STANDBY modes.

__HAL_RCC_PLL2_DISABLE

__HAL_RCC_PLL2_CLKOUT_ENABLE

Description:

- Enables or disables each clock output (PLL2_P_CLK, PLL2_Q_CLK, PLL2_R_CLK)

Parameters:

- __PLL2_CLOCKOUT__: specifies the PLL2 clock to be output. This parameter can be one or a combination of the following values:
  - RCC_PLL2_DIVP: This clock is used to generate an accurate kernel clock to achieve high-quality audio performance on SAI interface, SPI/I2S and LPTIM peripherals.
  - RCC_PLL2_DIVQ: This clock is used to generate kernel clock for the random number generator RNG (<=48 MHz), SPI, FDCAN and UART/USART peripherals.
  - RCC_PLL2_DIVR: This clock is used to generate kernel clock for ADC and DAC peripherals.

Return value:

- None

Notes:

- Enabling/disabling those clocks can be done at any time without the need to stop the PLL2, This is mainly used to save Power.

__HAL_RCC_PLL2_CLKOUT_DISABLE

__HAL_RCC_GET_PLL2_CLKOUT_CONFIG

Description:

- Macro to get the PLL2 clock output enable status.

Parameters:

- __PLL2_CLOCKOUT__: specifies the PLL2 clock to be output. This parameter can be one or a combination of the following values:
  - RCC_PLL2_DIVP: This clock is used to generate an accurate kernel clock to achieve high-quality audio performance on SAI interface, SPI/I2S and LPTIM peripherals.
  - RCC_PLL2_DIVQ: This clock is used to generate kernel clock for the random number generator RNG (<=48 MHz), SPI, FDCAN and UART/USART peripherals.
  - RCC_PLL2_DIVR: This clock is used to generate kernel clock for ADC and DAC peripherals.

Return value:

- SET: / RESET

__HAL_RCC_PLL2_FRACN_ENABLE

Description:

- Enables or disables Fractional Part Of The Multiplication Factor of PLL2 VCO.

Return value:

- None

Notes:

- Enabling/disabling Fractional Part can be done at any time without the need to stop the PLL2

__HAL_RCC_PLL2_FRACN_DISABLE

__HAL_RCC_PLL2_FRACN_CONFIG

Description:

- Macro to configures PLL2 clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLL2FRACN__: Specifies Fractional Part Of The Multiplication factor for PLL2 VCO It should be a value between 0 and 8191

Return value:

- None

Notes:

- These bits can be written at any time, allowing dynamic fine-tuning of the PLL2 VCO
- Warning: the software has to set correctly these bits to insure that the VCO output frequency is between its valid frequency range, which is: 192 to 836 MHz if PLL2VCOSEL = 0 150 to 420 MHz if PLL2VCOSEL = 1.

__HAL_RCC_PLL2_VCIRANGE

Description:

- Macro to select the PLL2 reference frequency range.

Parameters:

- __PLL2VCIRange__: specifies the PLL2 input frequency range This parameter can be one of the following values:
  - RCC_PLL2_VCIRANGE_0: Range frequency is between 1 and 2 MHz
  - RCC_PLL2_VCIRANGE_1: Range frequency is between 2 and 4 MHz
  - RCC_PLL2_VCIRANGE_2: Range frequency is between 4 and 8 MHz
  - RCC_PLL2_VCIRANGE_3: Range frequency is between 8 and 16 MHz

Return value:

- None

__HAL_RCC_PLL2_VCORANGE

Description:

- Macro to select the PLL2 reference frequency range.

Parameters:

- __RCC_PLL2VCORange__: specifies the PLL2 output frequency range This parameter can be one of the following values:
  - RCC_PLL2_VCORANGE_WIDE: Range frequency is between 192 and 836 MHz
  - RCC_PLL2_VCORANGE_MEDIUM: Range frequency is between 150 and 420 MHz

Return value:

- None

__HAL_RCC_PLL3_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL3 clock source.

Parameters:

- __PLL3SOURCE__: specifies the PLL3 entry clock source. This parameter can be one of the following values:
  - RCC_PLL3_SOURCE_NONE: No oscillator clock selected as PLL3 clock entry
  - RCC_PLL3_SOURCE_CSI: CSI oscillator clock selected as PLL3 clock entry
  - RCC_PLL3_SOURCE_HSI: HSI oscillator clock selected as PLL3 clock entry
  - RCC_PLL3_SOURCE_HSE: HSE oscillator clock selected as PLL3 clock entry

Notes:

- This function must be used only when all PLL3 is disabled.

__HAL_RCC_GET_PLL3_OSCSOURCE

Description:

- Macro to get the oscillator used as PLL3 clock source.

Return value:

- The: oscillator used as PLL3 clock source. The returned value can be one of the following:
  - RCC_PLL3_SOURCE_NONE: No oscillator is used as PLL3 clock source.
  - RCC_PLL3_SOURCE_CSI: CSI oscillator is used as PLL3 clock source.
  - RCC_PLL3_SOURCE_HSI: HSI oscillator is used as PLL3 clock source.
  - RCC_PLL3_SOURCE_HSE: HSE oscillator is used as PLL3 clock source.

__HAL_RCC_PLL3_CONFIG

Description:

- Macro to configures the PLL3 source, multiplication and division factors.

Parameters:

- __PLL3SOURCE__: specifies the PLL3 entry clock source. This parameter can be one of the following values:
  - RCC_PLL3_SOURCE_NONE No clock selected as PLL3 clock entry
  - RCC_PLL3_SOURCE_CSI CSI oscillator clock selected as PLL3 clock entry
  - RCC_PLL3_SOURCE_HSI HSI oscillator clock selected as PLL3 clock entry
  - RCC_PLL3_SOURCE_HSE HSE oscillator clock selected as PLL3 clock entry
- __PLL3M__: specifies the division factor of PLL3 input clock. This parameter must be a number between Min_Data = 1 and Max_Data = 63.
- __PLL3N__: specifies the multiplication factor for PLL3 VCO output clock This parameter must be a number between 4 and 512.
- __PLL3P__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128
- __PLL3Q__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128
- __PLL3R__: specifies the division factor for peripheral kernel clocks This parameter must be a number between 1 and 128

Return value:

- None

Notes:

- This function must be used only when PLL3 is disabled.
- You have to set the PLL3N parameter correctly to ensure that the VCO output frequency is between 150 and 420 MHz (when in medium VCO range) or between 192 and 836 MHZ (when in wide VCO range)

__HAL_RCC_PLL3_MULN_CONFIG

Description:

- Macro to configure the PLL3 clock multiplication factor N.

Parameters:

- __PLL3N__: specifies the multiplication factor for PLL3 VCO output clock. This parameter must be a number between 8 and 86.

Return value:

- None

Notes:

- This function must be used only when the PLL3 is disabled. PLL3 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL3_CONFIG() macro.
- You have to set the PLL3N parameter correctly to ensure that the VCO output frequency is between 192 and 836 MHz (Wide range) or 150 and 420 Mhz (Medium range). PLL3 clock frequency = f(PLL3) multiplied by PLL3N

__HAL_RCC_PLL3_DIVM_CONFIG

Description:

- Macro to configure the PLL3 input clock division factor M.

Parameters:

- __PLL3M__: specifies the division factor for PLL3 clock. This parameter must be a number between Min_Data = 1 and Max_Data = 63. In order to save power when PLL3 is not used, the value of PLL3M must be set to 0.

Return value:

- None

Notes:

- This function must be used only when the PLL3 is disabled. PLL3 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL3_CONFIG() macro.

__HAL_RCC_PLL3_DIVP_CONFIG

Description:

- Macro to configure the PLL3 clock division factor P.

Parameters:

- __PLL3P__: specifies the division factor for PLL3 output P clock. This parameter must be a number in the range (1 to 128). Use to set PLL3 output P clock frequency = f(PLL3) / PLL3P

Return value:

- None

Notes:

- This function must be used only when the PLL3 is disabled. PLL3 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL3_CONFIG() macro.

__HAL_RCC_PLL3_DIVQ_CONFIG

Description:

- Macro to configure the PLL3 clock division factor Q.

Parameters:

- __PLL3Q__: specifies the division factor for PLL3 output Q clock. This parameter must be a number in the range (1 to 128). Use to set PLL3 output Q clock frequency = f(PLL3) / PLL3Q

Return value:

- None

Notes:

- This function must be used only when the PLL3 is disabled. PLL3 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL3_CONFIG() macro.

__HAL_RCC_PLL3_DIVR_CONFIG

Description:

- Macro to configure the PLL3 clock division factor R.

Parameters:

- __PLL3R__: specifies the division factor for PLL3 output R clock. This parameter must be a number in the range (1 to 128). Use to set PLL3 output R clock frequency = f(PLL3) / PLL3R

Return value:

- None

Notes:

- This function must be used only when the PLL3 is disabled. PLL3 clock source is independent from the main PLL and is configured through __HAL_RCC_PLL3_CONFIG() macro.

__HAL_RCC_PLL3_FRACN_CONFIG

Description:

- Macro to configures PLL3 clock Fractional Part of The Multiplication Factor.

Parameters:

- __PLL3FRACN__: specifies Fractional Part Of The Multiplication Factor for PLL3 VCO It should be a value between 0 and 8191

Return value:

- None

Notes:

- These bits can be written at any time, allowing dynamic fine-tuning of the PLL3 VCO
- Warning: the software has to set correctly these bits to insure that the VCO output frequency is between its valid frequency range, which is: 192 to 836 MHz if PLL3VCOSEL = 0 150 to 420 MHz if PLL3VCOSEL = 1.

__HAL_RCC_PLL3_VCIRANGE

Description:

- Macro to select the PLL3 reference frequency range.

Parameters:

- __PLL3VCIRange__: specifies the PLL3 input frequency range This parameter can be one of the following values:
  - RCC_PLL3_VCIRANGE_0: Range frequency is between 1 and 2 MHz
  - RCC_PLL3_VCIRANGE_1: Range frequency is between 2 and 4 MHz
  - RCC_PLL3_VCIRANGE_2: Range frequency is between 4 and 8 MHz
  - RCC_PLL3_VCIRANGE_3: Range frequency is between 8 and 16 MHz

Return value:

- None

__HAL_RCC_PLL3_VCORANGE

Description:

- Macro to select the PLL3 reference frequency range.

Parameters:

- __RCC_PLL3VCORange__: specifies the PLL3 input frequency range This parameter can be one of the following values:
  - RCC_PLL3VCOWIDE: Range frequency is between 192 and 836 MHz
  - RCC_PLL3VCOMEDIUM: Range frequency is between 150 and 420 MHz

Return value:

- None

__HAL_RCC_PLL3_ENABLE

Description:

- Macros to enable or disable the PLL3.

Return value:

- NoneMacros: to enable or disable the main PLL3.

Notes:

- The PLL3 is disabled by hardware when entering STOP and STANDBY modes.
- After enabling PLL3, the application software should wait on PLL3RDY flag to be set indicating that PLL3 clock is stable and can be used as kernel clock source. PLL3 is disabled by hardware when entering STOP and STANDBY modes.

__HAL_RCC_PLL3_DISABLE

__HAL_RCC_PLL3_FRACN_ENABLE

Description:

- Enables or disables Fractional Part Of The Multiplication Factor of PLL3 VCO.

Return value:

- None

Notes:

- Enabling/disabling Fractional Part can be done at any time without the need to stop the PLL3

__HAL_RCC_PLL3_FRACN_DISABLE

__HAL_RCC_PLL3_CLKOUT_ENABLE

Description:

- Enables or disables each clock output (PLL3_P_CLK, PLL3_Q_CLK, PLL3_R_CLK)

Parameters:

- __PLL3_CLOCKOUT__: specifies the PLL3 clock to be outputted This parameter can be one of the following values:
  - RCC_PLL3_DIVP: This clock is used to generate an accurate clock to achieve high-quality audio performance on SAI and SPI/I2S interfaces.
  - RCC_PLL3_DIVQ: This clock is used to generate kernel clock for SPI, LPUART, UART/USART and USB peripherals.
  - RCC_PLL3_DIVR: This clock is used to generate kernel clock for I2C, I3C and LPTIM peripherals.

Return value:

- None

Notes:

- Enabling/disabling Those Clocks can be any time without the need to stop the PLL3, This is mainly used to save Power.

__HAL_RCC_PLL3_CLKOUT_DISABLE

__HAL_RCC_GET_PLL3_CLKOUT_CONFIG

Description:

- Macro to get clock output enable status (PLL3_SAI2).

Parameters:

- __PLL3_CLOCKOUT__: specifies the PLL3 clock to be output. This parameter can be one or a combination of the following values:
  - RCC_PLL3_DIVP: This clock is used to generate an accurate clock to achieve high-quality audio performance on SAI and SPI/I2S interfaces.
  - RCC_PLL3_DIVQ: This clock is used to generate kernel clock for SPI, LPUART, UART/USART and USB peripherals.
  - RCC_PLL3_DIVR: This clock is used to generate kernel clock for I2C, I3C and LPTIM peripherals.

Return value:

- SET: / RESET

__HAL_RCC_ADCDAC_CONFIG

Description:

- Macro to configure the ADC and DAC kernel clock source.

Parameters:

- __ADCDAC_CLKSOURCE__: specifies the ADC and DAC kernel clock source. This parameter can be one of the following values:
  - RCC_ADCDACCLKSOURCE_HCLK AHB bus clock selected as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_SYSCLK System clock selected as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_PLL2R PLL2R clock selected as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_HSE HSE clock selected as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_HSI HSI clock selected as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_CSI CSI clock selected as ADC and DAC kernel clock

Return value:

- None

__HAL_RCC_GET_ADCDAC_SOURCE

Description:

- Macro to get the ADC and DAC kernel clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ADCDACCLKSOURCE_HCLK AHB Bus clock used as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_SYSCLK System clock used as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_PLL2R PLL2R clock used as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_HSE HSE oscillator used as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_HSI HSI oscillator used as ADC and DAC kernel clock
  - RCC_ADCDACCLKSOURCE_CSI CSI oscillator used as ADC and DAC kernel clock

__HAL_RCC_DAC_LP_CONFIG

Description:

- Macro to configure the DAC kernel clock source in low-power mode.

Parameters:

- __DACLPCLKSOURCE__: specifies the DAC kernel clock source in low-power mode. This parameter can be one of the following values:
  - RCC_DACLPCLKSOURCE_LSE LSE oscillator selected as DAC kernel clock in low-power mode
  - RCC_DACLPCLKSOURCE_LSI LSI oscillator selected as DAC kernel clock in low-power mode

Return value:

- None

__HAL_RCC_GET_DAC_LP_SOURCE

Description:

- Macro to get the DAC kernel clock source in low-power mode.

Return value:

- The: clock source can be one of the following values:
  - RCC_DACLPCLKSOURCE_LSE LSE oscillator used as DAC kernel clock in low-power mode
  - RCC_DACLPCLKSOURCE_LSI LSI oscillator used as DAC kernel clock in low-power mode

__HAL_RCC_FDCAN_CONFIG

Description:

- Macro to configure the FDCAN kernel clock (FDCANCLK).

Parameters:

- __FDCAN_CLKSOURCE__: specifies the FDCAN kernel clock source. This parameter can be one of the following values:
  - RCC_FDCANCLKSOURCE_HSE HSE oscillator selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_PLL1Q PLL1Q Clock selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_PLL2Q PLL2Q Clock selected as FDCAN kernel clock

Return value:

- None

__HAL_RCC_GET_FDCAN_SOURCE

Description:

- Macro to get the FDCAN clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_FDCANCLKSOURCE_HSE HSE oscillator selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_PLL1Q PLL1Q Clock selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_PLL2Q PLL2Q Clock selected as FDCAN kernel clock

__HAL_RCC_LPTIM1_CONFIG

Description:

- Macro to configure the LPTIM1 clock (LPTIM1CLK).

Parameters:

- __LPTIM1_CLKSOURCE__: specifies the LPTIM1 clock source. This parameter can be one of the following values:
  - RCC_LPTIM1CLKSOURCE_PCLK3 PCLK3 selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_PLL2P PLL2P selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_PLL3R PLL3R selected as LPTIM1 clock (*)
  - RCC_LPTIM1CLKSOURCE_LSE LSE selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_LSI LSI selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_CLKP CLKP selected as LPTIM1 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_GET_LPTIM1_SOURCE

Description:

- Macro to get the LPTIM1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM1CLKSOURCE_PCLK3 PCLK3 selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_PLL2P PLL2P selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_PLL3R PLL3R selected as LPTIM1 clock (*)
  - RCC_LPTIM1CLKSOURCE_LSE LSE selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_LSI LSI selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_CLKP CLKP selected as LPTIM1 clock

__HAL_RCC_LPTIM2_CONFIG

Description:

- Macro to configure the LPTIM2 clock (LPTIM2CLK).

Parameters:

- __LPTIM2_CLKSOURCE__: specifies the LPTIM2 clock source. This parameter can be one of the following values:
  - RCC_LPTIM2CLKSOURCE_PCLK1 PCLK1 selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_PLL2P PLL2P selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_PLL3R PLL3R selected as LPTIM2 clock (*)
  - RCC_LPTIM2CLKSOURCE_LSE LSE selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_LSI LSI selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_CLKP CLKP selected as LPTIM2 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_GET_LPTIM2_SOURCE

Description:

- Macro to get the LPTIM2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM2CLKSOURCE_PCLK1 PCLK1 selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_PLL2P PLL2P selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_PLL3R PLL3R selected as LPTIM2 clock (*)
  - RCC_LPTIM2CLKSOURCE_LSE LSE selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_LSI LSI selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_CLKP CLKP selected as LPTIM2 clock

__HAL_RCC_LPTIM3_CONFIG

Description:

- Macro to configure the LPTIM3 clock (LPTIM3CLK).

Parameters:

- __LPTIM3_CLKSOURCE__: specifies the LPTIM3 clock source. This parameter can be one of the following values:
  - RCC_LPTIM3CLKSOURCE_PCLK3 PCLK3 selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_PLL2P PLL2P selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_PLL3R PLL3R selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSE LSE selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSI LSI selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_CLKP CLKP selected as LPTIM3 clock

Return value:

- None

__HAL_RCC_GET_LPTIM3_SOURCE

Description:

- Macro to get the LPTIM3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM3CLKSOURCE_PCLK3 PCLK3 selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_PLL2P PLL2P selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_PLL3R PLL3R selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSE LSE selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSI LSI selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_CLKP CLKP selected as LPTIM3 clock

__HAL_RCC_LPTIM4_CONFIG

Description:

- Macro to configure the LPTIM4 clock (LPTIM4CLK).

Parameters:

- __LPTIM4_CLKSOURCE__: specifies the LPTIM4 clock source. This parameter can be one of the following values:
  - RCC_LPTIM4CLKSOURCE_PCLK3 PCLK3 selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_PLL2P PLL2P selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_PLL3R PLL3R selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSE LSE selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSI LSI selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_CLKP CLKP selected as LPTIM4 clock

Return value:

- None

__HAL_RCC_GET_LPTIM4_SOURCE

Description:

- Macro to get the LPTIM4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM4CLKSOURCE_PCLK3 PCLK3 selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_PLL2P PLL2P selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_PLL3R PLL3R selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSE LSE selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSI LSI selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_CLKP CLKP selected as LPTIM4 clock

__HAL_RCC_LPTIM5_CONFIG

Description:

- Macro to configure the LPTIM5 clock (LPTIM5CLK).

Parameters:

- __LPTIM5_CLKSOURCE__: specifies the LPTIM5 clock source. This parameter can be one of the following values:
  - RCC_LPTIM5CLKSOURCE_PCLK3 PCLK3 selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_PLL2P PLL2P selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_PLL3R PLL3R selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSE LSE selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSI LSI selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_CLKP CLKP selected as LPTIM5 clock

Return value:

- None

__HAL_RCC_GET_LPTIM5_SOURCE

Description:

- Macro to get the LPTIM5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM5CLKSOURCE_PCLK3 PCLK3 selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_PLL2P PLL2P selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_PLL3R PLL3R selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSE LSE selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSI LSI selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_CLKP CLKP selected as LPTIM5 clock

__HAL_RCC_LPTIM6_CONFIG

Description:

- Macro to configure the LPTIM6 clock (LPTIM6CLK).

Parameters:

- __LPTIM6_CLKSOURCE__: specifies the LPTIM6 clock source. This parameter can be one of the following values:
  - RCC_LPTIM6CLKSOURCE_PCLK3 PCLK3 selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_PLL2P PLL2P selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_PLL3R PLL3R selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_LSE LSE selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_LSI LSI selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_CLKP CLKP selected as LPTIM6 clock

Return value:

- None

__HAL_RCC_GET_LPTIM6_SOURCE

Description:

- Macro to get the LPTIM6 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM6CLKSOURCE_PCLK3 PCLK3 selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_PLL2P PLL2P selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_PLL3R PLL3R selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_LSE LSE selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_LSI LSI selected as LPTIM6 clock
  - RCC_LPTIM6CLKSOURCE_CLKP CLKP selected as LPTIM6 clock

__HAL_RCC_SPI1_CONFIG

Description:

- macro to configure the SPI1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI1CLKSOURCE_PLL1Q PLL1Q selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_PLL2P PLL2P selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_PLL3P PLL3P selected as SPI1 clock (*)
  - RCC_SPI1CLKSOURCE_PIN External Clock selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_CLKP CLKP selected as SPI1 clock

__HAL_RCC_GET_SPI1_SOURCE

Description:

- macro to get the SPI1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI1CLKSOURCE_PLL1Q PLL1Q selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_PLL2P PLL2P selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_PLL3P PLL3P selected as SPI1 clock (*)
  - RCC_SPI1CLKSOURCE_PIN External Clock selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_CLKP CLKP selected as SPI1 clock

__HAL_RCC_SPI2_CONFIG

Description:

- macro to configure the SPI2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI2CLKSOURCE_PLL1Q PLL1Q selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_PLL2P PLL2P selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_PLL3P PLL3P selected as SPI2 clock (*)
  - RCC_SPI2CLKSOURCE_PIN External Clock selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_CLKP CLKP selected as SPI2 clock

__HAL_RCC_GET_SPI2_SOURCE

Description:

- macro to get the SPI2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI2CLKSOURCE_PLL1Q PLL1Q selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_PLL2P PLL2P selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_PLL3P PLL3P selected as SPI2 clock (*)
  - RCC_SPI2CLKSOURCE_PIN External Clock selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_CLKP CLKP selected as SPI2 clock

__HAL_RCC_SPI3_CONFIG

Description:

- macro to configure the SPI3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI3CLKSOURCE_PLL1Q PLL1Q used as SPI3 clock
  - RCC_SPI3CLKSOURCE_PLL2P PLL2P used as SPI3 clock
  - RCC_SPI3CLKSOURCE_PLL3P PLL3P used as SPI3 clock (*)
  - RCC_SPI3CLKSOURCE_PIN External Clock used as SPI3 clock
  - RCC_SPI3CLKSOURCE_CLKP CLKP used as SPI3 clock

__HAL_RCC_GET_SPI3_SOURCE

Description:

- macro to get the SPI3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI3CLKSOURCE_PLL1Q PLL1Q used as SPI3 clock
  - RCC_SPI3CLKSOURCE_PLL2P PLL2P used as SPI3 clock
  - RCC_SPI3CLKSOURCE_PLL3P PLL3P used as SPI3 clock (*)
  - RCC_SPI3CLKSOURCE_PIN External Clock used as SPI3 clock
  - RCC_SPI3CLKSOURCE_CLKP CLKP used as SPI3 clock

__HAL_RCC_SPI4_CONFIG

Description:

- macro to configure the SPI4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI4CLKSOURCE_PCLK2 PCLK2 used as SPI4 clock
  - RCC_SPI4CLKSOURCE_PLL2Q PLL2Q used as SPI4 clock
  - RCC_SPI4CLKSOURCE_PLL3Q PLL3Q used as SPI4 clock
  - RCC_SPI4CLKSOURCE_HSI HSI used as SPI4 clock
  - RCC_SPI4CLKSOURCE_CSI CSI Clock used as SPI4 clock
  - RCC_SPI4CLKSOURCE_HSE HSE Clock used as SPI4 clock

__HAL_RCC_GET_SPI4_SOURCE

Description:

- macro to get the SPI4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI4CLKSOURCE_PCLK2 PCLK2 used as SPI4 clock
  - RCC_SPI4CLKSOURCE_PLL2Q PLL2Q used as SPI4 clock
  - RCC_SPI4CLKSOURCE_PLL3Q PLL3Q used as SPI4 clock
  - RCC_SPI4CLKSOURCE_HSI HSI used as SPI4 clock
  - RCC_SPI4CLKSOURCE_CSI CSI used as SPI4 clock
  - RCC_SPI4CLKSOURCE_HSE HSE used as SPI4 clock

__HAL_RCC_SPI5_CONFIG

Description:

- macro to configure the SPI5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI5CLKSOURCE_PCLK3 PCLK3 used as SPI5 clock
  - RCC_SPI5CLKSOURCE_PLL2Q PLL2Q used as SPI5 clock
  - RCC_SPI5CLKSOURCE_PLL3Q PLL3Q used as SPI5 clock
  - RCC_SPI5CLKSOURCE_HSI HSI used as SPI5 clock
  - RCC_SPI5CLKSOURCE_CSI CSI Clock used as SPI5 clock
  - RCC_SPI5CLKSOURCE_HSE HSE Clock used as SPI5 clock

__HAL_RCC_GET_SPI5_SOURCE

Description:

- macro to get the SPI5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI5CLKSOURCE_PCLK3 PCLK3 used as SPI5 clock
  - RCC_SPI5CLKSOURCE_PLL2Q PLL2Q used as SPI5 clock
  - RCC_SPI5CLKSOURCE_PLL3Q PLL3Q used as SPI5 clock
  - RCC_SPI5CLKSOURCE_HSI HSI used as SPI5 clock
  - RCC_SPI5CLKSOURCE_CSI CSI used as SPI5 clock
  - RCC_SPI5CLKSOURCE_HSE HSE used as SPI5 clock

__HAL_RCC_SPI6_CONFIG

Description:

- macro to configure the SPI6 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI6CLKSOURCE_PCLK2 PCLK2 used as SPI6 clock
  - RCC_SPI6CLKSOURCE_PLL2Q PLL2Q used as SPI6 clock
  - RCC_SPI6CLKSOURCE_PLL3Q PLL3Q used as SPI6 clock
  - RCC_SPI6CLKSOURCE_HSI HSI used as SPI6 clock
  - RCC_SPI6CLKSOURCE_CSI CSI used as SPI6 clock
  - RCC_SPI6CLKSOURCE_HSE HSE used as SPI6 clock

__HAL_RCC_GET_SPI6_SOURCE

Description:

- macro to get the SPI6 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI6CLKSOURCE_PCLK2 PCLK2 used as SPI6 clock
  - RCC_SPI6CLKSOURCE_PLL2Q PLL2Q used as SPI6 clock
  - RCC_SPI6CLKSOURCE_PLL3Q PLL3Q used as SPI6 clock
  - RCC_SPI6CLKSOURCE_HSI HSI used as SPI6 clock
  - RCC_SPI6CLKSOURCE_CSI CSI used as SPI6 clock
  - RCC_SPI6CLKSOURCE_HSE HSE used as SPI6 clock

__HAL_RCC_I2C1_CONFIG

Description:

- Macro to configure the I2C1 clock (I2C1CLK).

Parameters:

- __I2C1_CLKSOURCE__: specifies the I2C1 clock source. This parameter can be one of the following values:
  - RCC_I2C1CLKSOURCE_PCLK1 PCLK1 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_PLL3R PLL3R selected as I2C1 clock (*)
  - RCC_I2C1CLKSOURCE_PLL2R PLL2R selected as I2C1 clock (**)
  - RCC_I2C1CLKSOURCE_HSI HSI selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_CSI CSI selected as I2C1 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines. (**) : For stm32h503xx family line.

__HAL_RCC_GET_I2C1_SOURCE

Description:

- Macro to get the I2C1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C1CLKSOURCE_PCLK1 PCLK1 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_PLL3R PLL3R selected as I2C1 clock (*)
  - RCC_I2C1CLKSOURCE_PLL2R PLL2R selected as I2C1 clock (**)
  - RCC_I2C1CLKSOURCE_HSI HSI selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_CSI CSI selected as I2C1 clock

__HAL_RCC_I2C2_CONFIG

Description:

- Macro to configure the I2C2 clock (I2C2CLK).

Parameters:

- __I2C2_CLKSOURCE__: specifies the I2C2 clock source. This parameter can be one of the following values:
  - RCC_I2C2CLKSOURCE_PCLK1 PCLK1 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_PLL3R PLL3R selected as I2C2 clock (*)
  - RCC_I2C2CLKSOURCE_PLL2R PLL2R selected as I2C2 clock (**)
  - RCC_I2C2CLKSOURCE_HSI HSI selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_CSI CSI selected as I2C2 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines. (**) : For stm32h503xx family line.

__HAL_RCC_GET_I2C2_SOURCE

Description:

- Macro to get the I2C2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C2CLKSOURCE_PCLK1 PCLK1 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_PLL3R PLL3R selected as I2C2 clock (*)
  - RCC_I2C2CLKSOURCE_PLL2R PLL2R selected as I2C2 clock (**)
  - RCC_I2C2CLKSOURCE_HSI HSI selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_CSI CSI selected as I2C2 clock

__HAL_RCC_I2C3_CONFIG

Description:

- Macro to configure the I2C3 clock (I2C3CLK).

Parameters:

- __I2C3_CLKSOURCE__: specifies the I2C3 clock source. This parameter can be one of the following values:
  - RCC_I2C3CLKSOURCE_PCLK3 PCLK3 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_PLL3R PLL3R selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_HSI HSI selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_CSI CSI selected as I2C3 clock

Return value:

- None

__HAL_RCC_GET_I2C3_SOURCE

Description:

- Macro to get the I2C3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C3CLKSOURCE_PCLK3 PCLK3 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_PLL3R PLL3R selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_HSI HSI selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_CSI CSI selected as I2C3 clock

__HAL_RCC_I2C4_CONFIG

Description:

- Macro to configure the I2C4 clock (I2C4CLK).

Parameters:

- __I2C4_CLKSOURCE__: specifies the I2C4 clock source. This parameter can be one of the following values:
  - RCC_I2C4CLKSOURCE_PCLK3 PCLK3 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_PLL3R PLL3R selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_HSI HSI selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_CSI CSI selected as I2C4 clock

Return value:

- None

__HAL_RCC_GET_I2C4_SOURCE

Description:

- Macro to get the I2C4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C4CLKSOURCE_PCLK3 PCLK3 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_PLL3R PLL3R selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_HSI HSI selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_CSI CSI selected as I2C4 clock

__HAL_RCC_I3C1_CONFIG

Description:

- Macro to configure the I3C1 clock (I3C1CLK).

Parameters:

- __I3C1_CLKSOURCE__: specifies the I3C1 clock source. This parameter can be one of the following values:
  - RCC_I3C1CLKSOURCE_PCLK1 PCLK1 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_PLL3R PLL3R selected as I3C1 clock (*)
  - RCC_I3C1CLKSOURCE_PLL2R PLL2R selected as I3C1 clock (**)
  - RCC_I3C1CLKSOURCE_HSI HSI selected as I3C1 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines. (**) : For stm32h503xx family line.

__HAL_RCC_GET_I3C1_SOURCE

Description:

- Macro to get the I3C1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I3C1CLKSOURCE_PCLK1 PCLK1 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_PLL3R PLL3R selected as I3C1 clock (*)
  - RCC_I3C1CLKSOURCE_PLL2R PLL2R selected as I3C1 clock (**)
  - RCC_I3C1CLKSOURCE_HSI HSI selected as I3C1 clock

__HAL_RCC_USART1_CONFIG

Description:

- Macro to configure the USART1 clock (USART1CLK).

Parameters:

- __USART1_CLKSOURCE__: specifies the USART1 clock source. This parameter can be one of the following values:
  - RCC_USART1CLKSOURCE_PCLK2 PCLK2 selected as USART1 clock
  - RCC_USART1CLKSOURCE_PLL2Q PLL2Q selected as USART1 clock
  - RCC_USART1CLKSOURCE_PLL3Q PLL3Q selected as USART1 clock (*)
  - RCC_USART1CLKSOURCE_HSI HSI selected as USART1 clock
  - RCC_USART1CLKSOURCE_CSI CSI selected as USART1 clock
  - RCC_USART1CLKSOURCE_LSE LSE selected as USART1 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_GET_USART1_SOURCE

Description:

- Macro to get the USART1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART1CLKSOURCE_PCLK2 PCLK2 selected as USART1 clock
  - RCC_USART1CLKSOURCE_PLL2Q PLL2Q selected as USART1 clock
  - RCC_USART1CLKSOURCE_PLL3Q PLL3Q selected as USART1 clock (*)
  - RCC_USART1CLKSOURCE_HSI HSI selected as USART1 clock
  - RCC_USART1CLKSOURCE_CSI CSI selected as USART1 clock
  - RCC_USART1CLKSOURCE_LSE LSE selected as USART1 clock

__HAL_RCC_USART2_CONFIG

Description:

- Macro to configure the USART2 clock (USART2CLK).

Parameters:

- __USART2_CLKSOURCE__: specifies the USART2 clock source. This parameter can be one of the following values:
  - RCC_USART2CLKSOURCE_PCLK1 PCLK2 selected as USART2 clock
  - RCC_USART2CLKSOURCE_PLL2Q PLL2Q selected as USART2 clock
  - RCC_USART2CLKSOURCE_PLL3Q PLL3Q selected as USART2 clock (*)
  - RCC_USART2CLKSOURCE_HSI HSI selected as USART2 clock
  - RCC_USART2CLKSOURCE_CSI CSI selected as USART2 clock
  - RCC_USART2CLKSOURCE_LSE LSE selected as USART2 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_GET_USART2_SOURCE

Description:

- Macro to get the USART2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART2CLKSOURCE_PCLK1 PCLK2 selected as USART2 clock
  - RCC_USART2CLKSOURCE_PLL2Q PLL2Q selected as USART2 clock
  - RCC_USART2CLKSOURCE_PLL3Q PLL3Q selected as USART2 clock (*)
  - RCC_USART2CLKSOURCE_HSI HSI selected as USART2 clock
  - RCC_USART2CLKSOURCE_CSI CSI selected as USART2 clock
  - RCC_USART2CLKSOURCE_LSE LSE selected as USART2 clock

__HAL_RCC_USART3_CONFIG

Description:

- Macro to configure the USART3 clock (USART3CLK).

Parameters:

- __USART3_CLKSOURCE__: specifies the USART3 clock source. This parameter can be one of the following values:
  - RCC_USART3CLKSOURCE_PCLK1 PCLK2 selected as USART3 clock
  - RCC_USART3CLKSOURCE_PLL2Q PLL2Q selected as USART3 clock
  - RCC_USART3CLKSOURCE_PLL3Q PLL3Q selected as USART3 clock (*)
  - RCC_USART3CLKSOURCE_HSI HSI selected as USART3 clock
  - RCC_USART3CLKSOURCE_CSI CSI selected as USART3 clock
  - RCC_USART3CLKSOURCE_LSE LSE selected as USART3 clock

Return value:

- None: (*) : For stm32h56xxx and stm32h57xxx family lines.

__HAL_RCC_GET_USART3_SOURCE

Description:

- Macro to get the USART3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART3CLKSOURCE_PCLK1 PCLK2 selected as USART3 clock
  - RCC_USART3CLKSOURCE_PLL2Q PLL2Q selected as USART3 clock
  - RCC_USART3CLKSOURCE_PLL3Q PLL3Q selected as USART3 clock (*)
  - RCC_USART3CLKSOURCE_HSI HSI selected as USART3 clock
  - RCC_USART3CLKSOURCE_CSI CSI selected as USART3 clock
  - RCC_USART3CLKSOURCE_LSE LSE selected as USART3 clock

__HAL_RCC_UART4_CONFIG

Description:

- Macro to configure the UART4 clock (UART4CLK).

Parameters:

- __UART4_CLKSOURCE__: specifies the UART4 clock source. This parameter can be one of the following values:
  - RCC_UART4CLKSOURCE_PCLK1 PCLK1 selected as UART4 clock
  - RCC_UART4CLKSOURCE_PLL2Q PLL2Q Clock selected as UART4 clock
  - RCC_UART4CLKSOURCE_PLL3Q PLL3Q Clock selected as UART4 clock
  - RCC_UART4CLKSOURCE_HSI HSI selected as UART4 clock
  - RCC_UART4CLKSOURCE_CSI CSI selected as UART4 clock
  - RCC_UART4CLKSOURCE_LSE LSE selected as UART4 clock

Return value:

- None

__HAL_RCC_GET_UART4_SOURCE

Description:

- Macro to get the UART4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART4CLKSOURCE_PCLK1 PCLK1 selected as UART4 clock
  - RCC_UART4CLKSOURCE_PLL2Q PLL2Q Clock selected as UART4 clock
  - RCC_UART4CLKSOURCE_PLL3Q PLL3Q Clock selected as UART4 clock
  - RCC_UART4CLKSOURCE_HSI HSI selected as UART4 clock
  - RCC_UART4CLKSOURCE_CSI CSI selected as UART4 clock
  - RCC_UART4CLKSOURCE_LSE LSE selected as UART4 clock

__HAL_RCC_UART5_CONFIG

Description:

- Macro to configure the UART5 clock (UART5CLK).

Parameters:

- __UART5_CLKSOURCE__: specifies the UART5 clock source. This parameter can be one of the following values:
  - RCC_UART5CLKSOURCE_PCLK1 PCLK1 selected as UART5 clock
  - RCC_UART5CLKSOURCE_PLL2Q PLL2Q Clock selected as UART5 clock
  - RCC_UART5CLKSOURCE_PLL3Q PLL3Q Clock selected as UART5 clock
  - RCC_UART5CLKSOURCE_HSI HSI selected as UART5 clock
  - RCC_UART5CLKSOURCE_CSI CSI selected as UART5 clock
  - RCC_UART5CLKSOURCE_LSE LSE selected as UART5 clock

Return value:

- None

__HAL_RCC_GET_UART5_SOURCE

Description:

- Macro to get the UART5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART5CLKSOURCE_PCLK1 PCLK1 selected as UART5 clock
  - RCC_UART5CLKSOURCE_PLL2Q PLL2Q Clock selected as UART5 clock
  - RCC_UART5CLKSOURCE_PLL3Q PLL3Q Clock selected as UART5 clock
  - RCC_UART5CLKSOURCE_HSI HSI selected as UART5 clock
  - RCC_UART5CLKSOURCE_CSI CSI selected as UART5 clock
  - RCC_UART5CLKSOURCE_LSE LSE selected as UART5 clock

__HAL_RCC_USART6_CONFIG

Description:

- Macro to configure the USART6 clock (USART6CLK).

Parameters:

- __USART6_CLKSOURCE__: specifies the USART6 clock source. This parameter can be one of the following values:
  - RCC_USART6CLKSOURCE_PCLK1 PCLK2 selected as USART6 clock
  - RCC_USART6CLKSOURCE_PLL2Q PLL2Q selected as USART6 clock
  - RCC_USART6CLKSOURCE_PLL3Q PLL3Q selected as USART6 clock
  - RCC_USART6CLKSOURCE_HSI HSI selected as USART6 clock
  - RCC_USART6CLKSOURCE_CSI CSI selected as USART6 clock
  - RCC_USART6CLKSOURCE_LSE LSE selected as USART6 clock

Return value:

- None

__HAL_RCC_GET_USART6_SOURCE

Description:

- Macro to get the USART6 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART6CLKSOURCE_PCLK1 PCLK1 selected as USART6 clock
  - RCC_USART6CLKSOURCE_PLL2Q PLL2Q selected as USART6 clock
  - RCC_USART6CLKSOURCE_PLL3Q PLL3Q selected as USART6 clock
  - RCC_USART6CLKSOURCE_HSI HSI selected as USART6 clock
  - RCC_USART6CLKSOURCE_CSI CSI selected as USART6 clock
  - RCC_USART6CLKSOURCE_LSE LSE selected as USART6 clock

__HAL_RCC_UART7_CONFIG

Description:

- Macro to configure the UART7 clock (UART7CLK).

Parameters:

- __UART7_CLKSOURCE__: specifies the UART7 clock source. This parameter can be one of the following values:
  - RCC_UART7CLKSOURCE_PCLK1 PCLK1 selected as UART7 clock
  - RCC_UART7CLKSOURCE_PLL2Q PLL2Q selected as UART7 clock
  - RCC_UART7CLKSOURCE_PLL3Q PLL3Q selected as UART7 clock
  - RCC_UART7CLKSOURCE_HSI HSI selected as UART7 clock
  - RCC_UART7CLKSOURCE_CSI CSI selected as UART7 clock
  - RCC_UART7CLKSOURCE_LSE LSE selected as UART7 clock

Return value:

- None

__HAL_RCC_GET_UART7_SOURCE

Description:

- Macro to get the UART7 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART7CLKSOURCE_PCLK1 PCLK1 selected as UART7 clock
  - RCC_UART7CLKSOURCE_PLL2Q PLL2Q selected as UART7 clock
  - RCC_UART7CLKSOURCE_PLL3Q PLL3Q selected as UART7 clock
  - RCC_UART7CLKSOURCE_HSI HSI selected as UART7 clock
  - RCC_UART7CLKSOURCE_CSI CSI selected as UART7 clock
  - RCC_UART7CLKSOURCE_LSE LSE selected as UART7 clock

__HAL_RCC_UART8_CONFIG

Description:

- Macro to configure the UART8 clock (UART8CLK).

Parameters:

- __UART8_CLKSOURCE__: specifies the UART8 clock source. This parameter can be one of the following values:
  - RCC_UART8CLKSOURCE_PCLK1 PCLK1 selected as UART8 clock
  - RCC_UART8CLKSOURCE_PLL2Q PLL2Q selected as UART8 clock
  - RCC_UART8CLKSOURCE_PLL3Q PLL3Q selected as UART8 clock
  - RCC_UART8CLKSOURCE_HSI HSI selected as UART8 clock
  - RCC_UART8CLKSOURCE_CSI CSI selected as UART8 clock
  - RCC_UART8CLKSOURCE_LSE LSE selected as UART8 clock

Return value:

- None

__HAL_RCC_GET_UART8_SOURCE

Description:

- Macro to get the UART8 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART8CLKSOURCE_PCLK1 PCLK1 selected as UART8 clock
  - RCC_UART8CLKSOURCE_PLL2Q PLL2Q selected as UART8 clock
  - RCC_UART8CLKSOURCE_PLL3Q PLL3Q selected as UART8 clock
  - RCC_UART8CLKSOURCE_HSI HSI selected as UART8 clock
  - RCC_UART8CLKSOURCE_CSI CSI selected as UART8 clock
  - RCC_UART8CLKSOURCE_LSE LSE selected as UART8 clock

__HAL_RCC_UART9_CONFIG

Description:

- Macro to configure the UART9 clock (UART9CLK).

Parameters:

- __UART9_CLKSOURCE__: specifies the UART9 clock source. This parameter can be one of the following values:
  - RCC_UART9CLKSOURCE_PCLK1 PCLK1 selected as UART9 clock
  - RCC_UART9CLKSOURCE_PLL2Q PLL2Q selected as UART9 clock
  - RCC_UART9CLKSOURCE_PLL3Q PLL3Q selected as UART9 clock
  - RCC_UART9CLKSOURCE_HSI HSI selected as UART9 clock
  - RCC_UART9CLKSOURCE_CSI CSI selected as UART9 clock
  - RCC_UART9CLKSOURCE_LSE LSE selected as UART9 clock

Return value:

- None

__HAL_RCC_GET_UART9_SOURCE

Description:

- Macro to get the UART9 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART9CLKSOURCE_PCLK1 PCLK1 selected as UART9 clock
  - RCC_UART9CLKSOURCE_PLL2Q PLL2Q selected as UART9 clock
  - RCC_UART9CLKSOURCE_PLL3Q PLL3Q selected as UART9 clock
  - RCC_UART9CLKSOURCE_HSI HSI selected as UART9 clock
  - RCC_UART9CLKSOURCE_CSI CSI selected as UART9 clock
  - RCC_UART9CLKSOURCE_LSE LSE selected as UART9 clock

__HAL_RCC_USART10_CONFIG

Description:

- Macro to configure the USART10 clock (USART10CLK).

Parameters:

- __USART10_CLKSOURCE__: specifies the USART10 clock source. This parameter can be one of the following values:
  - RCC_USART10CLKSOURCE_PCLK1 PCLK1 selected as USART10 clock
  - RCC_USART10CLKSOURCE_PLL2Q PLL2Q selected as USART10 clock
  - RCC_USART10CLKSOURCE_PLL3Q PLL3Q selected as USART10 clock
  - RCC_USART10CLKSOURCE_HSI HSI selected as USART10 clock
  - RCC_USART10CLKSOURCE_CSI CSI selected as USART10 clock
  - RCC_USART10CLKSOURCE_LSE LSE selected as USART10 clock

Return value:

- None

__HAL_RCC_GET_USART10_SOURCE

Description:

- Macro to get the USART10 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART10CLKSOURCE_PCLK1 PCLK1 selected as USART10 clock
  - RCC_USART10CLKSOURCE_PLL2Q PLL2Q selected as USART10 clock
  - RCC_USART10CLKSOURCE_PLL3Q PLL3Q selected as USART10 clock
  - RCC_USART10CLKSOURCE_HSI HSI selected as USART10 clock
  - RCC_USART10CLKSOURCE_CSI CSI selected as USART10 clock
  - RCC_USART10CLKSOURCE_LSE LSE selected as USART10 clock

__HAL_RCC_USART11_CONFIG

Description:

- Macro to configure the USART11 clock (USART11CLK).

Parameters:

- __USART11_CLKSOURCE__: specifies the USART11 clock source. This parameter can be one of the following values:
  - RCC_USART11CLKSOURCE_PCLK1 PCLK1 selected as USART11 clock
  - RCC_USART11CLKSOURCE_PLL2Q PLL2Q selected as USART11 clock
  - RCC_USART11CLKSOURCE_PLL3Q PLL3Q selected as USART11 clock
  - RCC_USART11CLKSOURCE_HSI HSI selected as USART11 clock
  - RCC_USART11CLKSOURCE_CSI CSI selected as USART11 clock
  - RCC_USART11CLKSOURCE_LSE LSE selected as USART11 clock

Return value:

- None

__HAL_RCC_GET_USART11_SOURCE

Description:

- Macro to get the USART11 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART11CLKSOURCE_PCLK1 PCLK1 selected as USART11 clock
  - RCC_USART11CLKSOURCE_PLL2Q PLL2Q selected as USART11 clock
  - RCC_USART11CLKSOURCE_PLL3Q PLL3Q selected as USART11 clock
  - RCC_USART11CLKSOURCE_HSI HSI selected as USART11 clock
  - RCC_USART11CLKSOURCE_CSI CSI selected as USART11 clock
  - RCC_USART11CLKSOURCE_LSE LSE selected as USART11 clock

__HAL_RCC_UART12_CONFIG

Description:

- Macro to configure the UART12 clock (UART12CLK).

Parameters:

- __UART12_CLKSOURCE__: specifies the UART12 clock source. This parameter can be one of the following values:
  - RCC_UART12CLKSOURCE_PCLK1 PCLK1 selected as UART12 clock
  - RCC_UART12CLKSOURCE_PLL2Q PLL2Q selected as UART12 clock
  - RCC_UART12CLKSOURCE_PLL3Q PLL3Q selected as UART12 clock
  - RCC_UART12CLKSOURCE_HSI HSI selected as UART12 clock
  - RCC_UART12CLKSOURCE_CSI CSI selected as UART12 clock
  - RCC_UART12CLKSOURCE_LSE LSE selected as UART12 clock

Return value:

- None

__HAL_RCC_GET_UART12_SOURCE

Description:

- Macro to get the UART12 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART12CLKSOURCE_PCLK1 PCLK1 selected as UART12 clock
  - RCC_UART12CLKSOURCE_PLL2Q PLL2Q selected as UART12 clock
  - RCC_UART12CLKSOURCE_PLL3Q PLL3Q selected as UART12 clock
  - RCC_UART12CLKSOURCE_HSI HSI selected as UART12 clock
  - RCC_UART12CLKSOURCE_CSI CSI selected as UART12 clock
  - RCC_UART12CLKSOURCE_LSE LSE selected as UART12 clock

__HAL_RCC_LPUART1_CONFIG

Description:

- Macro to configure the LPUART1 clock (LPUART1CLK).

Parameters:

- __LPUART1_CLKSOURCE__: specifies the LPUART1 clock source. This parameter can be one of the following values:
  - RCC_LPUART1CLKSOURCE_PCLK3 PCLK3 selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_PLL2Q PLL2Q selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_PLL3Q PLL3Q selected as LPUART1 clock (*)
  - RCC_LPUART1CLKSOURCE_HSI HSI selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_CSI CSI selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_LSE LSE selected as LPUART1 clock

Return value:

- None

__HAL_RCC_GET_LPUART1_SOURCE

Description:

- Macro to get the LPUART1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPUART1CLKSOURCE_PCLK3 PCLK3 selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_PLL2Q PLL2Q selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_PLL3Q PLL3Q selected as LPUART1 clock (*)
  - RCC_LPUART1CLKSOURCE_HSI HSI selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_CSI CSI selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_LSE LSE selected as LPUART1 clock

__HAL_RCC_OSPI_CONFIG

Description:

- Macro to configure the OctoSPI clock.

Parameters:

- __OSPI_CLKSOURCE__: specifies the OctoSPI clock source. This parameter can be one of the following values:
  - RCC_OSPICLKSOURCE_HCLK HCLK selected as OctoSPI clock
  - RCC_OSPICLKSOURCE_PLL1Q PLL1Q divider clock selected as OctoSPI clock
  - RCC_OSPICLKSOURCE_PLL2R PLL2R divider clock selected as OctoSPI clock
  - RCC_OSPICLKSOURCE_CLKP CLKP selected as OctoSPI clock

Return value:

- None

__HAL_RCC_GET_OSPI_SOURCE

Description:

- Macro to get the OctoSPI clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_OSPICLKSOURCE_HCLK HCLK selected as OctoSPI clock
  - RCC_OSPICLKSOURCE_PLL1Q PLL1Q divider clock selected as OctoSPI clock
  - RCC_OSPICLKSOURCE_PLL2R PLL2R divider clock selected as OctoSPI clock
  - RCC_OSPICLKSOURCE_CLKP CLKP selected as OctoSPI clock

__HAL_RCC_SDMMC1_CONFIG

Description:

- Macro to configure the SDMMC1 clock (SDMMCCLK).

Parameters:

- __SDMMC1_CLKSOURCE__: specifies the SDMMC1 clock source. This parameter can be one of the following values:
  - RCC_SDMMC1CLKSOURCE_PLL1Q PLL1Q selected as SDMMC1 clock
  - RCC_SDMMC1CLKSOURCE_PLL2R PLL2R selected as SDMMC1 clock

__HAL_RCC_GET_SDMMC1_SOURCE

Description:

- macro to get the SDMMC1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SDMMC1CLKSOURCE_PLL1Q PLL1Q selected as SDMMC1 clock
  - RCC_SDMMC1CLKSOURCE_PLL2R PLL2R selected as SDMMC1 clock

__HAL_RCC_SDMMC2_CONFIG

Description:

- Macro to configure the SDMMC2 clock (SDMMCCLK).

Parameters:

- __SDMMC2_CLKSOURCE__: specifies the SDMMC2 clock source. This parameter can be one of the following values:
  - RCC_SDMMC2CLKSOURCE_PLL1Q PLL1Q selected as SDMMC2 clock
  - RCC_SDMMC2CLKSOURCE_PLL2R PLL2R selected as SDMMC2 clock

__HAL_RCC_GET_SDMMC2_SOURCE

Description:

- macro to get the SDMMC2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SDMMC2CLKSOURCE_PLL1Q PLL1Q selected as SDMMC2 clock
  - RCC_SDMMC2CLKSOURCE_PLL2R PLL2R selected as SDMMC2 clock

__HAL_RCC_RNG_CONFIG

Description:

- macro to configure the RNG clock (RNGCLK).

Parameters:

- __RNGCLKSource__: specifies the RNG clock source. This parameter can be one of the following values:
  - RCC_RNGCLKSOURCE_HSI48: HSI48 selected as RNG clock
  - RCC_RNGCLKSOURCE_PLL1Q: PLL1Q selected as RNG clock
  - RCC_RNGCLKSOURCE_LSE: LSE selected as RNG clock
  - RCC_RNGCLKSOURCE_LSI: LSI selected as RNG clock

__HAL_RCC_GET_RNG_SOURCE

Description:

- macro to get the RNG clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_RNGCLKSOURCE_HSI48: HSI48 selected as RNG clock
  - RCC_RNGCLKSOURCE_PLL1Q: PLL1Q selected as RNG clock
  - RCC_RNGCLKSOURCE_LSE: LSE selected as RNG clock
  - RCC_RNGCLKSOURCE_LSI: LSI selected as RNG clock

__HAL_RCC_SAI1_CONFIG

Description:

- Macro to configure the SAI1 clock source.

Parameters:

- __SAI1_CLKSOURCE__: defines the SAI1 clock source. This parameter can be one of the following values:
  - RCC_SAI1CLKSOURCE_PLL1Q PLL1Q selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PLL2P PLL2Pselected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PLL3P PLL3P selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PIN External clock selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_CLKP CLKP selected as SAI1 clock

Return value:

- None

__HAL_RCC_GET_SAI1_SOURCE

Description:

- Macro to get the SAI1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SAI1CLKSOURCE_PLL1Q PLL1Q selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PLL2P PLL2P selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PLL3P PLL3P selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PIN External clock selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_CLKP CLKP selected as SAI1 clock

__HAL_RCC_SAI2_CONFIG

Description:

- Macro to configure the SAI2 clock source.

Parameters:

- __SAI2_CLKSOURCE__: defines the SAI2 clock source. This parameter can be one of the following values:
  - RCC_SAI2CLKSOURCE_PLL1Q PLL1Q selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PLL2P PLL2P selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PLL3P PLL3P selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PIN External clock selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_CLKP CLKP selected as SAI2 clock

Return value:

- None

__HAL_RCC_GET_SAI2_SOURCE

Description:

- Macro to get the SAI2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SAI2CLKSOURCE_PLL1Q PLL1Q selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PLL2P PLL2P selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PLL3P PLL3P selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PIN External clock selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_CLKP CLKP selected as SAI2 clock

__HAL_RCC_CLKP_CONFIG

Description:

- Macro to configure the CLKP : Oscillator clock for peripheral.

Parameters:

- __CLKPSource__: specifies Oscillator clock for peripheral This parameter can be one of the following values:
  - RCC_CLKPSOURCE_HSI HSI oscillator selected as clock for peripheral
  - RCC_CLKPSOURCE_CSI CSI oscillator selected as clock for peripheral
  - RCC_CLKPSOURCE_HSE HSE oscillator selected as clock for peripheral

__HAL_RCC_GET_CLKP_SOURCE

Description:

- Macro to get the oscillator clock for peripheral clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_CLKPSOURCE_HSI HSI selected Oscillator clock for peripheral
  - RCC_CLKPSOURCE_CSI CSI selected Oscillator clock for peripheral
  - RCC_CLKPSOURCE_HSE HSE selected Oscillator clock for peripheral

__HAL_RCC_CEC_CONFIG

Description:

- Macro to configure the CEC clock (CECCLK)

Parameters:

- __CECCLKSource__: specifies the CEC clock source. This parameter can be one of the following values:
  - RCC_CECCLKSOURCE_LSE LSE selected as CEC clock
  - RCC_CECCLKSOURCE_LSI LSI selected as CEC clock
  - RCC_CECCLKSOURCE_CSI_DIV122 CSI Divided by 122 selected as CEC clock

__HAL_RCC_GET_CEC_SOURCE

Description:

- Macro to get the CEC clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_CECCLKSOURCE_LSE: LSE selected as CEC clock
  - RCC_CECCLKSOURCE_LSI: LSI selected as CEC clock
  - RCC_CECCLKSOURCE_CSI_DIV122: CSI Divided by 122 selected as CEC clock

__HAL_RCC_USB_CONFIG

Description:

- Macro to configure the USB clock (USBCLK).

Parameters:

- __USBCLKSource__: specifies the USB clock source. This parameter can be one of the following values:
  - RCC_USBCLKSOURCE_PLL1Q PLL1Q selected as USB clock
  - RCC_USBCLKSOURCE_PLL3Q PLL3Q selected as USB clock (*)
  - RCC_USBCLKSOURCE_PLL2Q PLL2Q selected as USB clock (**)
  - RCC_USBCLKSOURCE_HSI48 HSI48 selected as USB clock

__HAL_RCC_GET_USB_SOURCE

Description:

- Macro to get the USB clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USBCLKSOURCE_PLL1Q PLL1Q selected as USB clock
  - RCC_USBCLKSOURCE_PLL3Q PLL3Q selected as USB clock (*)
  - RCC_USBCLKSOURCE_PLL2Q PLL2Q selected as USB clock (**)
  - RCC_USBCLKSOURCE_HSI48 HSI48 selected as USB clock

__HAL_RCC_TIMCLKPRESCALER

Description:

- Macro to configure the Timers clocks prescalers.

Parameters:

- __PRESC__: specifies the Timers clocks prescalers selection This parameter can be one of the following values:
  - RCC_TIMPRES_DEACTIVATED: The Timers kernels clocks prescaler is equal to rcc_hclk1 if PPREx is corresponding to division by 1 or 2, else it is equal to 2 x Frcc_pclkx (default after reset)
  - RCC_TIMPRES_ACTIVATED: The Timers kernels clocks prescaler is equal to rcc_hclk1 if PPREx is corresponding to division by 1, 2 or 4, else it is equal to 4 x Frcc_pclkx

__HAL_RCC_CRS_ENABLE_IT

Description:

- Enable the specified CRS interrupts.

Parameters:

- __INTERRUPT__: specifies the CRS interrupt sources to be enabled. This parameter can be any combination of the following values:
  - RCC_CRS_IT_SYNCOK SYNC event OK interrupt
  - RCC_CRS_IT_SYNCWARN SYNC warning interrupt
  - RCC_CRS_IT_ERR Synchronization or trimming error interrupt
  - RCC_CRS_IT_ESYNC Expected SYNC interrupt

Return value:

- None

__HAL_RCC_CRS_DISABLE_IT

Description:

- Disable the specified CRS interrupts.

Parameters:

- __INTERRUPT__: specifies the CRS interrupt sources to be disabled. This parameter can be any combination of the following values:
  - RCC_CRS_IT_SYNCOK SYNC event OK interrupt
  - RCC_CRS_IT_SYNCWARN SYNC warning interrupt
  - RCC_CRS_IT_ERR Synchronization or trimming error interrupt
  - RCC_CRS_IT_ESYNC Expected SYNC interrupt

Return value:

- None

__HAL_RCC_CRS_GET_IT_SOURCE

Description:

- Check whether the CRS interrupt has occurred or not.

Parameters:

- __INTERRUPT__: specifies the CRS interrupt source to check. This parameter can be one of the following values:
  - RCC_CRS_IT_SYNCOK SYNC event OK interrupt
  - RCC_CRS_IT_SYNCWARN SYNC warning interrupt
  - RCC_CRS_IT_ERR Synchronization or trimming error interrupt
  - RCC_CRS_IT_ESYNC Expected SYNC interrupt

Return value:

- The: new state of __INTERRUPT__ (0 or 1).

RCC_CRS_IT_ERROR_MASK

Description:

- Clear the CRS interrupt pending bits.

Parameters:

- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be any combination of the following values:
  - RCC_CRS_IT_SYNCOK SYNC event OK interrupt
  - RCC_CRS_IT_SYNCWARN SYNC warning interrupt
  - RCC_CRS_IT_ERR Synchronization or trimming error interrupt
  - RCC_CRS_IT_ESYNC Expected SYNC interrupt
  - RCC_CRS_IT_TRIMOVF Trimming overflow or underflow interrupt
  - RCC_CRS_IT_SYNCERR SYNC error interrupt
  - RCC_CRS_IT_SYNCMISS SYNC missed interrupt

__HAL_RCC_CRS_CLEAR_IT

__HAL_RCC_CRS_GET_FLAG

Description:

- Check whether the specified CRS flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - RCC_CRS_FLAG_SYNCOK SYNC event OK
  - RCC_CRS_FLAG_SYNCWARN SYNC warning
  - RCC_CRS_FLAG_ERR Error
  - RCC_CRS_FLAG_ESYNC Expected SYNC
  - RCC_CRS_FLAG_TRIMOVF Trimming overflow or underflow
  - RCC_CRS_FLAG_SYNCERR SYNC error
  - RCC_CRS_FLAG_SYNCMISS SYNC missed

Return value:

- The: new state of _FLAG_ (TRUE or FALSE).

RCC_CRS_FLAG_ERROR_MASK

Description:

- Clear the CRS specified FLAG.

Parameters:

- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - RCC_CRS_FLAG_SYNCOK SYNC event OK
  - RCC_CRS_FLAG_SYNCWARN SYNC warning
  - RCC_CRS_FLAG_ERR Error
  - RCC_CRS_FLAG_ESYNC Expected SYNC
  - RCC_CRS_FLAG_TRIMOVF Trimming overflow or underflow
  - RCC_CRS_FLAG_SYNCERR SYNC error
  - RCC_CRS_FLAG_SYNCMISS SYNC missed

Return value:

- None

Notes:

- RCC_CRS_FLAG_ERR clears RCC_CRS_FLAG_TRIMOVF, RCC_CRS_FLAG_SYNCERR, RCC_CRS_FLAG_SYNCMISS and consequently RCC_CRS_FLAG_ERR

RCC Extended MCOx Clock Config

__HAL_RCC_MCO1_CONFIG

Description:

- Macro to configure the MCO1 clock.

Parameters:

- __MCOCLKSOURCE__: specifies the MCO1 clock source. This parameter can be one of the following values:
  - RCC_MCO1SOURCE_HSI: HSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_LSE: LSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSE: HSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_PLL1QCLK: PLL1Q clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSI48: HSI48 (48MHZ) selected as MCO1 source
- __MCODIV__: specifies the MCO clock prescaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 up to RCC_MCODIV_15 : divider applied to MCO1 clock

__HAL_RCC_MCO2_CONFIG

Description:

- Macro to configure the MCO2 clock.

Parameters:

- __MCOCLKSOURCE__: specifies the MCO2 clock source. This parameter can be one of the following values:
  - RCC_MCO2SOURCE_SYSCLK: System clock (SYSCLK) selected as MCO2 source
  - RCC_MCO2SOURCE_PLL2PCLK: PLL2P clock selected as MCO2 source
  - RCC_MCO2SOURCE_HSE: HSE clock selected as MCO2 source
  - RCC_MCO2SOURCE_PLL1PCLK: PLL1P clock selected as MCO2 source
  - RCC_MCO2SOURCE_CSI: CSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_LSI: LSI clock selected as MCO2 source
- __MCODIV__: specifies the MCO clock prescaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 up to RCC_MCODIV_15 : divider applied to MCO2 clock

61.2 RNG Firmware driver API description

The following section lists the various functions of the RNG library.

61.2.1 How to use this driver

The RNG HAL driver can be used as follows:

1. Enable the RNG controller clock using __HAL_RCC_RNG_CLK_ENABLE() macro in HAL_RNG_MspInit().
2. Activate the RNG peripheral using HAL_RNG_Init() function.
3. Wait until the 32 bit Random Number Generator contains a valid random data using (polling/interrupt) mode.
4. Get the 32 bit random number using HAL_RNG_GenerateRandomNumber() function.

61.2.2 Callback registration

The compilation define USE_HAL_RNG_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_RNG_RegisterCallback() to register a user callback. Function HAL_RNG_RegisterCallback() allows to register following callbacks:

- ErrorCallback : RNG Error Callback.
- MspInitCallback : RNG MspInit.
- MspDeInitCallback : RNG MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_RNG_UnRegisterCallback() to reset a callback to the default weak (overridden) function. HAL_RNG_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : RNG Error Callback.
- MspInitCallback : RNG MspInit.
- MspDeInitCallback : RNG MspDeInit.

For specific callback ReadyDataCallback, use dedicated register callbacks: respectively HAL_RNG_RegisterReadyDataCallback() , HAL_RNG_UnRegisterReadyDataCallback().

By default, after the HAL_RNG_Init() and when the state is HAL_RNG_STATE_RESET all callbacks are set to the corresponding weak (overridden) functions: example HAL_RNG_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak (overridden) functions in the HAL_RNG_Init() and HAL_RNG_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_RNG_Init() and HAL_RNG_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_RNG_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_RNG_STATE_READY or HAL_RNG_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_RNG_RegisterCallback() before calling HAL_RNG_DeInit() or HAL_RNG_Init() function.

When The compilation define USE_HAL_RNG_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak (overridden) callbacks are used.

61.2.3 Initialization and configuration functions

This section provides functions allowing to:

- Initialize the RNG according to the specified parameters in the RNG_InitTypeDef and create the associated handle
- DeInitialize the RNG peripheral
- Initialize the RNG MSP
- DeInitialize RNG MSP

This section contains the following APIs:

- ***HAL_RNG_Init()***
- ***HAL_RNG_DeInit()***
- ***HAL_RNG_MspInit()***
- ***HAL_RNG_MspDeInit()***
- ***HAL_RNG_RegisterCallback()***
- ***HAL_RNG_UnRegisterCallback()***

- *HAL_RNG_RegisterReadyDataCallback()*
- *HAL_RNG_UnRegisterReadyDataCallback()*

61.2.4 Peripheral Control functions

This section provides functions allowing to:

- Get the 32 bit Random number
- Get the 32 bit Random number with interrupt enabled
- Handle RNG interrupt request

This section contains the following APIs:

- *HAL_RNG_GenerateRandomNumber()*
- *HAL_RNG_GenerateRandomNumber_IT()*
- *HAL_RNG_IRQHandler()*
- *HAL_RNG_ReadLastRandomNumber()*
- *HAL_RNG_ReadyDataCallback()*
- *HAL_RNG_ErrorCallback()*

61.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_RNG_GetState()*
- *HAL_RNG_GetError()*

61.2.6 Detailed description of functions

HAL_RNG_Init

Function name

HAL_StatusTypeDef HAL_RNG_Init (RNG_HandleTypeDef * hrng)

Function description

Initializes the RNG peripheral and creates the associated handle.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **HAL:** status

HAL_RNG_DeInit

Function name

HAL_StatusTypeDef HAL_RNG_DeInit (RNG_HandleTypeDef * hrng)

Function description

DeInitializes the RNG peripheral.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **HAL:** status

HAL_RNG_MspInit

Function name

void HAL_RNG_MspInit (RNG_HandleTypeDef * hrng)

Function description

Initializes the RNG MSP.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **None:**

HAL_RNG_MspDeInit

Function name

void HAL_RNG_MspDeInit (RNG_HandleTypeDef * hrng)

Function description

DeInitializes the RNG MSP.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **None:**

HAL_RNG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_RNG_RegisterCallback (RNG_HandleTypeDef * hrng, HAL_RNG_CallbackIDTypeDef CallbackID, pRNG_CallbackTypeDef pCallback)

Function description

Register a User RNG Callback To be used instead of the weak predefined callback.

Parameters

- **hrng:** RNG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_RNG_ERROR_CB_ID Error callback ID
  - HAL_RNG_MSPINIT_CB_ID MspInit callback ID
  - HAL_RNG_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_RNG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_RNG_UnRegisterCallback (RNG_HandleTypeDef * hrng, HAL_RNG_CallbackIDTypeDef CallbackID)

Function description

Unregister an RNG Callback RNG callback is redirected to the weak predefined callback.

Parameters

- **hrng:** RNG handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_RNG_ERROR_CB_ID Error callback ID
  - HAL_RNG_MSPINIT_CB_ID MspInit callback ID
  - HAL_RNG_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_RNG_RegisterReadyDataCallback

Function name

HAL_StatusTypeDef HAL_RNG_RegisterReadyDataCallback (RNG_HandleTypeDef * hrng, pRNG_ReadyDataCallbackTypeDef pCallback)

Function description

Register Data Ready RNG Callback To be used instead of the weak HAL_RNG_ReadyDataCallback() predefined callback.

Parameters

- **hrng:** RNG handle
- **pCallback:** pointer to the Data Ready Callback function

Return values

- **HAL:** status

HAL_RNG_UnRegisterReadyDataCallback

Function name

HAL_StatusTypeDef HAL_RNG_UnRegisterReadyDataCallback (RNG_HandleTypeDef * hrng)

Function description

UnRegister the Data Ready RNG Callback Data Ready RNG Callback is redirected to the weak HAL_RNG_ReadyDataCallback() predefined callback.

Parameters

- **hrng:** RNG handle

Return values

- **HAL:** status

HAL_RNG_GenerateRandomNumber

Function name

HAL_StatusTypeDef HAL_RNG_GenerateRandomNumber (RNG_HandleTypeDef * hrng, uint32_t * random32bit)

Function description

Generates a 32-bit random number.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.
- **random32bit:** pointer to generated random number variable if successful.

Return values

- **HAL:** status

Notes

- This function checks value of RNG_FLAG_DRDY flag to know if valid random number is available in the DR register (RNG_FLAG_DRDY flag set whenever a random number is available through the RNG_DR register). After transitioning from 0 to 1 (random number available), RNG_FLAG_DRDY flag remains high until output buffer becomes empty after reading four words from the RNG_DR register, i.e. further function calls will immediately return a new u32 random number (additional words are available and can be read by the application, till RNG_FLAG_DRDY flag remains high).
- When no more random number data is available in DR register, RNG_FLAG_DRDY flag is automatically cleared.

HAL_RNG_GenerateRandomNumber_IT

Function name

HAL_StatusTypeDef HAL_RNG_GenerateRandomNumber_IT (RNG_HandleTypeDef * hrng)

Function description

Generates a 32-bit random number in interrupt mode.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **HAL:** status

HAL_RNG_ReadLastRandomNumber

Function name

uint32_t HAL_RNG_ReadLastRandomNumber (const RNG_HandleTypeDef * hrng)

Function description

Read latest generated random number.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **random:** value

HAL_RNG_IRQHandler

Function name

void HAL_RNG_IRQHandler (RNG_HandleTypeDef * hrng)

Function description

Handles RNG interrupt request.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **None:**

Notes

- In the case of a clock error, the RNG is no more able to generate random numbers because the PLL48CLK clock is not correct. User has to check that the clock controller is correctly configured to provide the RNG clock and clear the CEIS bit using __HAL_RNG_CLEAR_IT(). The clock error has no impact on the previously generated random numbers, and the RNG_DR register contents can be used.
- In the case of a seed error, the generation of random numbers is interrupted as long as the SECS bit is '1'. If a number is available in the RNG_DR register, it must not be used because it may not have enough entropy. In this case, it is recommended to clear the SEIS bit using __HAL_RNG_CLEAR_IT(), then disable and enable the RNG peripheral to reinitialize and restart the RNG.
- User-written HAL_RNG_ErrorCallback() API is called once whether SEIS or CEIS are set.

HAL_RNG_ErrorCallback

Function name

void HAL_RNG_ErrorCallback (RNG_HandleTypeDef * hrng)

Function description

RNG error callbacks.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **None:**

HAL_RNG_ReadyDataCallback

Function name

void HAL_RNG_ReadyDataCallback (RNG_HandleTypeDef * hrng, uint32_t random32bit)

Function description

Data Ready callback in non-blocking mode.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.
- **random32bit:** generated random number.

Return values

- **None:**

Notes

- When RNG_FLAG_DRDY flag value is set, first random number has been read from DR register in IRQ Handler and is provided as callback parameter. Depending on valid data available in the conditioning output buffer, additional words can be read by the application from DR register till DRDY bit remains high.

HAL_RNG_GetState

Function name

HAL_RNG_StateTypeDef HAL_RNG_GetState (const RNG_HandleTypeDef * hrng)

Function description

Returns the RNG state.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure that contains the configuration information for RNG.

Return values

- **HAL:** state

HAL_RNG_GetError

Function name

uint32_t HAL_RNG_GetError (const RNG_HandleTypeDef * hrng)

Function description

Return the RNG handle error code.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure.

Return values

- **RNG:** Error Code

RNG_RecoverSeedError

Function name

HAL_StatusTypeDef RNG_RecoverSeedError (RNG_HandleTypeDef * hrng)

Function description

RNG sequence to recover from a seed error.

Parameters

- **hrng:** pointer to a RNG_HandleTypeDef structure.

Return values

- **HAL:** status

61.3 RNG Firmware driver defines

The following section lists the various define and macros of the module.

61.3.1 RNG

RNG

RNG Error Definition

HAL_RNG_ERROR_NONE

No error

HAL_RNG_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_RNG_ERROR_TIMEOUT

Timeout error

HAL_RNG_ERROR_BUSY

Busy error

HAL_RNG_ERROR_SEED

Seed error

HAL_RNG_ERROR_CLOCK

Clock error

RNG Interrupt definition

RNG_IT_DRDY

Data Ready interrupt

RNG_IT_CEI

Clock error interrupt

RNG_IT_SEI

Seed error interrupt

RNG Flag definition

RNG_FLAG_DRDY

Data ready

RNG_FLAG_CECS

Clock error current status

RNG_FLAG_SECS

Seed error current status

RNG Clock Error Detection

RNG_CED_ENABLE

Clock error detection Enabled

RNG_CED_DISABLE

Clock error detection Disabled

RNG Exported Macros

__HAL_RNG_RESET_HANDLE_STATE

Description:

- Reset RNG handle state.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_ENABLE

Description:

- Enables the RNG peripheral.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_DISABLE

Description:

- Disables the RNG peripheral.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_GET_FLAG

Description:

- Check the selected RNG flag status.

Parameters:

- __HANDLE__: RNG Handle
- __FLAG__: RNG flag This parameter can be one of the following values:
  - RNG_FLAG_DRDY: Data ready
  - RNG_FLAG_CECS: Clock error current status
  - RNG_FLAG_SECS: Seed error current status

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_RNG_CLEAR_FLAG

Description:

- Clears the selected RNG flag status.

Parameters:

- __HANDLE__: RNG handle
- __FLAG__: RNG flag to clear

Return value:

- None

Notes:

- WARNING: This is a dummy macro for HAL code alignment, flags RNG_FLAG_DRDY, RNG_FLAG_CECS and RNG_FLAG_SECS are read-only.

__HAL_RNG_ENABLE_IT

Description:

- Enables the RNG interrupts.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_DISABLE_IT

Description:

- Disables the RNG interrupts.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_GET_IT

Description:

- Checks whether the specified RNG interrupt has occurred or not.

Parameters:

- __HANDLE__: RNG Handle
- __INTERRUPT__: specifies the RNG interrupt status flag to check. This parameter can be one of the following values:
  - RNG_IT_DRDY: Data ready interrupt
  - RNG_IT_CEI: Clock error interrupt
  - RNG_IT_SEI: Seed error interrupt

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_RNG_CLEAR_IT

Description:

- Clear the RNG interrupt status flags.

Parameters:

- __HANDLE__: RNG Handle
- __INTERRUPT__: specifies the RNG interrupt status flag to clear. This parameter can be one of the following values:
  - RNG_IT_CEI: Clock error interrupt
  - RNG_IT_SEI: Seed error interrupt

Return value:

- None

Notes:

- RNG_IT_DRDY flag is read-only, reading RNG_DR register automatically clears RNG_IT_DRDY.

Auto Reset configuration

RNG_ARDIS_ENABLE

automatic reset after seed error

RNG_ARDIS_DISABLE

Disable automatic reset after seed error

Value used to configure an internal

RNG_CLKDIV_BY_1

No clock division

RNG_CLKDIV_BY_2

2 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_4

4 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_8

8 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_16

16 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_32

32 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_64

64 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_128

128 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_256

256 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_512

512 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_1024

1024 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_2048

2048 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_4096

4096 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_8192

8192 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_16384

16384 RNG clock cycles per internal RNG clock

RNG_CLKDIV_BY_32768

32768 RNG clock cycles per internal RNG clock

NIST Compliance configuration

RNG_NIST_COMPLIANT

NIST compliant configuration

RNG_CUSTOM_NIST

Custom NIST configuration

62 HAL RNG Extension Driver

62.1 RNGEx Firmware driver registers structures

62.1.1 RNG_ConfigTypeDef

RNG_ConfigTypeDef is defined in the stm32h5xx_hal_rng_ex.h

Data Fields

- ***uint32_t Config1***
- ***uint32_t Config2***
- ***uint32_t Config3***
- ***uint32_t ClockDivider***
- ***uint32_t NistCompliance***
- ***uint32_t AutoReset***
- ***uint32_t HealthTest***

Field Documentation

- ***uint32_t RNG_ConfigTypeDef::Config1***
  Config1 must be a value between 0 and 0x3F
- ***uint32_t RNG_ConfigTypeDef::Config2***
  Config2 must be a value between 0 and 0x7
- ***uint32_t RNG_ConfigTypeDef::Config3***
  Config3 must be a value between 0 and 0xF
- ***uint32_t RNG_ConfigTypeDef::ClockDivider***
  Clock Divider factor.This parameter can be a value of ***RNG_Ex_Clock_Divider_Factor***
- ***uint32_t RNG_ConfigTypeDef::NistCompliance***
  NIST compliance.This parameter can be a value of ***RNG_Ex_NIST_Compliance***
- ***uint32_t RNG_ConfigTypeDef::AutoReset***
  automatic reset When a noise source error occurs value of ***RNG_Ex_Auto_Reset***
- ***uint32_t RNG_ConfigTypeDef::HealthTest***
  RNG health test control must be a value between 0x0FFCABFF and 0x00005200

62.2 RNGEx Firmware driver defines

The following section lists the various define and macros of the module.

62.2.1 RNGEx

RNGEx

63 HAL RTC Generic Driver

63.1 RTC Firmware driver registers structures

63.1.1 RTC_InitTypeDef

RTC_InitTypeDef is defined in the stm32h5xx_hal_rtc.h

Data Fields

- ***uint32_t HourFormat***
- ***uint32_t AsynchPrediv***
- ***uint32_t SynchPrediv***
- ***uint32_t OutPut***
- ***uint32_t OutPutRemap***
- ***uint32_t OutPutPolarity***
- ***uint32_t OutPutType***
- ***uint32_t OutPutPullUp***
- ***uint32_t BinMode***
- ***uint32_t BinMixBcdU***

Field Documentation

- ***uint32_t RTC_InitTypeDef::HourFormat***
  Specifies the RTC Hour Format. This parameter can be a value of ***RTC_Hour_Formats***
- ***uint32_t RTC_InitTypeDef::AsynchPrediv***
  Specifies the RTC Asynchronous Predivider value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x7F
- ***uint32_t RTC_InitTypeDef::SynchPrediv***
  Specifies the RTC Synchronous Predivider value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x7FFF
- ***uint32_t RTC_InitTypeDef::OutPut***
  Specifies which signal will be routed to the RTC output. This parameter can be a value of ***RTCEx_Output_selection_Definitions***
- ***uint32_t RTC_InitTypeDef::OutPutRemap***
  Specifies the remap for RTC output. This parameter can be a value of ***RTC_Output_ALARM_OUT_Remap***
- ***uint32_t RTC_InitTypeDef::OutPutPolarity***
  Specifies the polarity of the output signal. This parameter can be a value of ***RTC_Output_Polarity_Definitions***
- ***uint32_t RTC_InitTypeDef::OutPutType***
  Specifies the RTC Output Pin mode. This parameter can be a value of ***RTC_Output_Type_ALARM_OUT***
- ***uint32_t RTC_InitTypeDef::OutPutPullUp***
  Specifies the RTC Output Pull-Up mode. This parameter can be a value of ***RTC_Output_PullUp_ALARM_OUT***
- ***uint32_t RTC_InitTypeDef::BinMode***
  Specifies the RTC binary mode. This parameter can be a value of ***RTCEx_Binary_Mode***
- ***uint32_t RTC_InitTypeDef::BinMixBcdU***
  Specifies the BCD calendar update if and only if BinMode = RTC_BINARY_MIX. This parameter can be a value of ***RTCEx_Binary_mix_BCDU***

63.1.2 RTC_TimeTypeDef

RTC_TimeTypeDef is defined in the stm32h5xx_hal_rtc.h

Data Fields

- ***uint8_t Hours***
- ***uint8_t Minutes***
- ***uint8_t Seconds***

- ***uint8_t TimeFormat***
- ***uint32_t SubSeconds***
- ***uint32_t SecondFraction***
- ***uint32_t DayLightSaving***
- ***uint32_t StoreOperation***

Field Documentation

- ***uint8_t RTC_TimeTypeDef::Hours***
  Specifies the RTC Time Hour. This parameter must be a number between: Min_Data = 0 and Max_Data = 12 if the RTC_HOURFORMAT_12 is selected. This parameter must be a number between: Min_Data = 0 and Max_Data = 23 if the RTC_HOURFORMAT_24 is selected
- ***uint8_t RTC_TimeTypeDef::Minutes***
  Specifies the RTC Time Minutes. This parameter must be a number between Min_Data = 0 and Max_Data = 59
- ***uint8_t RTC_TimeTypeDef::Seconds***
  Specifies the RTC Time Seconds. This parameter must be a number between Min_Data = 0 and Max_Data = 59
- ***uint8_t RTC_TimeTypeDef::TimeFormat***
  Specifies the RTC AM/PM Time. This parameter can be a value of ***RTC_AM_PM_Definitions***
- ***uint32_t RTC_TimeTypeDef::SubSeconds***
  Specifies the RTC_SSR RTC Sub Second register content. This field is not used by HAL_RTC_SetTime. If the free running 32 bit counter is not activated (mode binary none)
  - This parameter corresponds to a time unit range between [0-1] Second with [1 Sec / SecondFraction +1] granularity else
  - This parameter corresponds to the free running 32 bit counter.
- ***uint32_t RTC_TimeTypeDef::SecondFraction***
  Specifies the range or granularity of Sub Second register content corresponding to Synchronous pre-scaler factor value (PREDIV_S) This parameter corresponds to a time unit range between [0-1] Second with [1 Sec / SecondFraction +1] granularity. This field will be used only by HAL_RTC_GetTime function
- ***uint32_t RTC_TimeTypeDef::DayLightSaving***
  This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions
- ***uint32_t RTC_TimeTypeDef::StoreOperation***
  This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions

63.1.3 RTC_DateTypeDef

RTC_DateTypeDef is defined in the stm32h5xx_hal_rtc.h

Data Fields

- ***uint8_t WeekDay***
- ***uint8_t Month***
- ***uint8_t Date***
- ***uint8_t Year***

Field Documentation

- ***uint8_t RTC_DateTypeDef::WeekDay***
  Specifies the RTC Date WeekDay. This parameter can be a value of ***RTC_WeekDay_Definitions***
- ***uint8_t RTC_DateTypeDef::Month***
  Specifies the RTC Date Month (in BCD format). This parameter can be a value of ***RTC_Month_Date_Definitions***
- ***uint8_t RTC_DateTypeDef::Date***
  Specifies the RTC Date. This parameter must be a number between Min_Data = 1 and Max_Data = 31
- ***uint8_t RTC_DateTypeDef::Year***
  Specifies the RTC Date Year. This parameter must be a number between Min_Data = 0 and Max_Data = 99

63.1.4 RTC_AlarmTypeDef

RTC_AlarmTypeDef is defined in the stm32h5xx_hal_rtc.h

Data Fields

- ***RTC_TimeTypeDef AlarmTime***
- ***uint32_t AlarmMask***
- ***uint32_t AlarmSubSecondMask***
- ***uint32_t BinaryAutoClr***
- ***uint32_t AlarmDateWeekDaySel***
- ***uint8_t AlarmDateWeekDay***
- ***uint32_t FlagAutoClr***
- ***uint32_t Alarm***

Field Documentation

- ***RTC_TimeTypeDef RTC_AlarmTypeDef::AlarmTime***
  Specifies the RTC Alarm Time members
- ***uint32_t RTC_AlarmTypeDef::AlarmMask***
  Specifies the RTC Alarm Masks. This parameter can be a value of ***RTC_AlarmMask_Definitions***
- ***uint32_t RTC_AlarmTypeDef::AlarmSubSecondMask***
  Specifies the RTC Alarm SubSeconds Masks. if Binary mode is RTC_BINARY_ONLY or is RTC_BINARY_MIX This parameter can be a value of ***RTCEx_Alarm_Sub_Seconds_binary_Masks_Definitions*** else if Binary mode is RTC_BINARY_NONE This parameter can be a value of ***RTC_Alarm_Sub_Seconds_BCD_Masks_Definitions***
- ***uint32_t RTC_AlarmTypeDef::BinaryAutoClr***
  Clear synchronously counter (RTC_SSR) on binary alarm. RTC_ALARMSUBSECONDBIN_AUTOCLR_YES must only be used if Binary mode is RTC_BINARY_ONLY This parameter can be a value of ***RTCEx_Alarm_Sub_Seconds_binary_Clear_Definitions***
- ***uint32_t RTC_AlarmTypeDef::AlarmDateWeekDaySel***
  Specifies the RTC Alarm is on Date or WeekDay. This parameter can be a value of ***RTC_AlarmDateWeekDay_Definitions***
- ***uint8_t RTC_AlarmTypeDef::AlarmDateWeekDay***
  Specifies the RTC Alarm Date/WeekDay. If the Alarm Date is selected, this parameter must be set to a value in the 1-31 range. If the Alarm WeekDay is selected, this parameter can be a value of ***RTC_WeekDay_Definitions***
- ***uint32_t RTC_AlarmTypeDef::FlagAutoClr***
  Specifies the alarm trigger generation. This feature is meaningful to avoid any RTC software execution after configuration. This parameter can be a value of ***RTC_ALARM_Flag_AutoClear_Definitions***
- ***uint32_t RTC_AlarmTypeDef::Alarm***
  Specifies the alarm. This parameter can be a value of ***RTC_Alarms_Definitions***

63.1.5 __RTC_HandleTypeDef

__RTC_HandleTypeDef is defined in the stm32h5xx_hal_rtc.h

Data Fields

- ***RTC_TypeDef * Instance***
- ***RTC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_RTCStateTypeDef State***
- ***void(* AlarmAEventCallback***
- ***void(* AlarmBEventCallback***
- ***void(* TimeStampEventCallback***
- ***void(* WakeUpTimerEventCallback***
- ***void(* SSRUEventCallback***
- ***void(* Tamper1EventCallback***
- ***void(* Tamper2EventCallback***
- ***void(* Tamper3EventCallback***
- ***void(* Tamper4EventCallback***

- ***void(* Tamper5EventCallback***
- ***void(* Tamper6EventCallback***
- ***void(* Tamper7EventCallback***
- ***void(* Tamper8EventCallback***
- ***void(* InternalTamper1EventCallback***
- ***void(* InternalTamper2EventCallback***
- ***void(* InternalTamper3EventCallback***
- ***void(* InternalTamper4EventCallback***
- ***void(* InternalTamper5EventCallback***
- ***void(* InternalTamper6EventCallback***
- ***void(* InternalTamper7EventCallback***
- ***void(* InternalTamper8EventCallback***
- ***void(* InternalTamper9EventCallback***
- ***void(* InternalTamper11EventCallback***
- ***void(* InternalTamper12EventCallback***
- ***void(* InternalTamper13EventCallback***
- ***void(* InternalTamper15EventCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***RTC_TypeDef* __RTC_HandleTypeDef::Instance***
  Legacy register base address. Not used anymore, the driver directly uses cmsis base address
- ***RTC_InitTypeDef __RTC_HandleTypeDef::Init***
  RTC required parameters
- ***HAL_LockTypeDef __RTC_HandleTypeDef::Lock***
  RTC locking object
- ***__IO HAL_RTCStateTypeDef __RTC_HandleTypeDef::State***
  Time communication state
- ***void(* __RTC_HandleTypeDef::AlarmAEventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Alarm A Event callback
- ***void(* __RTC_HandleTypeDef::AlarmBEventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Alarm B Event callback
- ***void(* __RTC_HandleTypeDef::TimeStampEventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC TimeStamp Event callback
- ***void(* __RTC_HandleTypeDef::WakeUpTimerEventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC WakeUpTimer Event callback
- ***void(* __RTC_HandleTypeDef::SSRUEventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC SSRU Event callback
- ***void(* __RTC_HandleTypeDef::Tamper1EventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Tamper 1 Event callback
- ***void(* __RTC_HandleTypeDef::Tamper2EventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Tamper 2 Event callback
- ***void(* __RTC_HandleTypeDef::Tamper3EventCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Tamper 3 Event callback

63.2 RTC Firmware driver API description

The following section lists the various functions of the RTC library.

63.2.1 RTC Operating Condition

The real-time clock (RTC) and the RTC backup registers can be powered from the VBAT voltage when the main VDD supply is powered off. To retain the content of the RTC backup registers and supply the RTC when VDD is turned off, VBAT pin can be connected to an optional standby voltage supplied by a battery or by another source.

63.2.2 Backup Domain Reset

The backup domain reset sets all RTC registers and the RCC_BDCR register to their reset values. A backup domain reset is generated when one of the following events occurs:

1. Software reset, triggered by setting the BDRST bit in the RCC Backup domain control register (RCC_BDCR).
2. VDD or VBAT power on, if both supplies have previously been powered off.
3. Tamper detection event resets all data backup registers.

63.2.3 Backup Domain Access

After reset, the backup domain (RTC registers and RTC backup data registers) is protected against possible unwanted write accesses.

To enable access to the RTC Domain and RTC registers, proceed as follows:

- Enable access to RTC domain using the HAL_PWR_EnableBkUpAccess() function.

- Call the function HAL_RCCEx_PeriphCLKConfig with RCC_PERIPHCLK_RTC for PeriphClockSelection and select RTCClockSelection (LSE, LSI or HSEdiv32)
- Enable RTC Clock using the __HAL_RCC_RTC_ENABLE() function.

63.2.4 How to use RTC Driver

- Enable the RTC domain access (see description in the section above).
- Configure the RTC Prescaler (Asynchronous and Synchronous) and RTC hour format using the HAL_RTC_Init() function.

Time and Date configuration

- To configure the RTC Calendar (Time and Date) use the HAL_RTC_SetTime() and HAL_RTC_SetDate() functions.
- To read the RTC Calendar, use the HAL_RTC_GetTime() and HAL_RTC_GetDate() functions.

Alarm configuration

- To configure the RTC Alarm use the HAL_RTC_SetAlarm() function. You can also configure the RTC Alarm with interrupt mode using the HAL_RTC_SetAlarm_IT() function.
- To read the RTC Alarm, use the HAL_RTC_GetAlarm() function.

63.2.5 RTC and low power modes

The MCU can be woken up from a low power mode by an RTC alternate function.

The RTC alternate functions are the RTC alarms (Alarm A and Alarm B), RTC wakeup, RTC tamper event detection and RTC time stamp event detection. These RTC alternate functions can wake up the system from the Stop and Standby low power modes.

The system can also wake up from low power modes without depending on an external interrupt (Auto-wakeup mode), by using the RTC alarm or the RTC wakeup events.

The RTC provides a programmable time base for waking up from the Stop or Standby mode at regular intervals. Wakeup from STOP and STANDBY modes is possible only when the RTC clock source is LSE or LSI.

Callback registration

63.2.6 Initialization and de-initialization functions

This section provides functions allowing to initialize and configure the RTC Prescaler (Synchronous and Asynchronous), RTC Hour format, disable RTC registers Write protection, enter and exit the RTC initialization mode, RTC registers synchronization check and reference clock detection enable.

1. The RTC Prescaler is programmed to generate the RTC 1Hz time base. It is split into 2 programmable prescalers to minimize power consumption.
   – A 7-bit asynchronous prescaler and a 15-bit synchronous prescaler.
   – When both prescalers are used, it is recommended to configure the asynchronous prescaler to a high value to minimize power consumption.
2. All RTC registers are Write protected. Writing to the RTC registers is enabled by writing a key into the Write Protection register, RTC_WPR.
3. To configure the RTC Calendar, user application should enter initialization mode. In this mode, the calendar counter is stopped and its value can be updated. When the initialization sequence is complete, the calendar restarts counting after 4 RTCCLK cycles.
4. To read the calendar through the shadow registers after Calendar initialization, calendar update or after wakeup from low power modes the software must first clear the RSF flag. The software must then wait until it is set again before reading the calendar, which means that the calendar registers have been correctly copied into the RTC_TR and RTC_DR shadow registers. The HAL_RTC_WaitForSynchro() function implements the above software sequence (RSF clear and RSF check).

This section contains the following APIs:

- ***HAL_RTC_Init()***
- ***HAL_RTC_DeInit()***
- ***HAL_RTC_RegisterCallback()***

- *HAL_RTC_UnRegisterCallback()*
- *HAL_RTC_MspInit()*
- *HAL_RTC_MspDeInit()*

63.2.7 RTC Time and Date functions

This section provides functions allowing to configure Time and Date features
This section contains the following APIs:

- *HAL_RTC_SetTime()*
- *HAL_RTC_GetTime()*
- *HAL_RTC_SetDate()*
- *HAL_RTC_GetDate()*
- *HAL_RTC_DST_Add1Hour()*
- *HAL_RTC_DST_Sub1Hour()*
- *HAL_RTC_DST_SetStoreOperation()*
- *HAL_RTC_DST_ClearStoreOperation()*
- *HAL_RTC_DST_ReadStoreOperation()*

63.2.8 RTC Alarm functions

This section provides functions allowing to configure Alarm feature
This section contains the following APIs:

- *HAL_RTC_SetAlarm()*
- *HAL_RTC_SetAlarm_IT()*
- *HAL_RTC_DeactivateAlarm()*
- *HAL_RTC_GetAlarm()*
- *HAL_RTC_AlarmIRQHandler()*
- *HAL_RTC_AlarmAEventCallback()*
- *HAL_RTC_PollForAlarmAEvent()*

63.2.9 Peripheral Control functions

This subsection provides functions allowing to

- Wait for RTC Time and Date Synchronization

This section contains the following APIs:

- *HAL_RTC_WaitForSynchro()*

63.2.10 Peripheral State functions

This subsection provides functions allowing to

- Get RTC state

This section contains the following APIs:

- *HAL_RTC_GetState()*

63.2.11 Detailed description of functions

HAL_RTC_Init

Function name

HAL_StatusTypeDef HAL_RTC_Init (RTC_HandleTypeDef * hrtc)

Function description

Initialize the RTC peripheral.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTC_DeInit

Function name

HAL_StatusTypeDef HAL_RTC_DeInit (RTC_HandleTypeDef * hrtc)

Function description

DeInitialize the RTC peripheral.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- This function does not reset the RTC Backup Data registers.

HAL_RTC_MspInit

Function name

void HAL_RTC_MspInit (RTC_HandleTypeDef * hrtc)

Function description

Initialize the RTC MSP.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_MspDeInit

Function name

void HAL_RTC_MspDeInit (RTC_HandleTypeDef * hrtc)

Function description

DeInitialize the RTC MSP.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_RTC_RegisterCallback (RTC_HandleTypeDef * hrtc, HAL_RTC_CallbackIDTypeDef CallbackID, pRTC_CallbackTypeDef pCallback)

Function description

Register a User RTC Callback To be used instead of the weak predefined callback.

Parameters

- **hrtc:** RTC handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_RTC_ALARM_A_EVENT_CB_ID Alarm A Event Callback ID
  - HAL_RTC_ALARM_B_EVENT_CB_ID Alarm B Event Callback ID
  - HAL_RTC_TIMESTAMP_EVENT_CB_ID TimeStamp Event Callback ID
  - HAL_RTC_WAKEUPTIMER_EVENT_CB_ID WakeUp Timer Event Callback ID
  - HAL_RTC_TAMPER1_EVENT_CB_ID Tamper 1 Callback ID
  - HAL_RTC_TAMPER2_EVENT_CB_ID Tamper 2 Callback ID
  - HAL_RTC_TAMPER3_EVENT_CB_ID Tamper 3 Callback ID
  - HAL_RTC_TAMPER4_EVENT_CB_ID Tamper 4 Callback ID
  - HAL_RTC_TAMPER5_EVENT_CB_ID Tamper 5 Callback ID
  - HAL_RTC_TAMPER6_EVENT_CB_ID Tamper 6 Callback ID
  - HAL_RTC_TAMPER7_EVENT_CB_ID Tamper 7 Callback ID
  - HAL_RTC_TAMPER8_EVENT_CB_ID Tamper 8 Callback ID
  - HAL_RTC_INTERNAL_TAMPER1_EVENT_CB_ID Internal Tamper 1 Callback ID
  - HAL_RTC_INTERNAL_TAMPER2_EVENT_CB_ID Internal Tamper 2 Callback ID
  - HAL_RTC_INTERNAL_TAMPER3_EVENT_CB_ID Internal Tamper 3 Callback ID
  - HAL_RTC_INTERNAL_TAMPER4_EVENT_CB_ID Internal Tamper 4 Callback ID
  - HAL_RTC_INTERNAL_TAMPER5_EVENT_CB_ID Internal Tamper 5 Callback ID
  - HAL_RTC_INTERNAL_TAMPER6_EVENT_CB_ID Internal Tamper 6 Callback ID
  - HAL_RTC_INTERNAL_TAMPER7_EVENT_CB_ID Internal Tamper 7 Callback ID
  - HAL_RTC_INTERNAL_TAMPER8_EVENT_CB_ID Internal Tamper 8 Callback ID
  - HAL_RTC_INTERNAL_TAMPER9_EVENT_CB_ID Internal Tamper 9 Callback ID
  - HAL_RTC_INTERNAL_TAMPER11_EVENT_CB_ID Internal Tamper 11 Callback ID
  - HAL_RTC_INTERNAL_TAMPER12_EVENT_CB_ID Internal Tamper 12 Callback ID
  - HAL_RTC_INTERNAL_TAMPER13_EVENT_CB_ID Internal Tamper 13 Callback ID
  - HAL_RTC_INTERNAL_TAMPER15_EVENT_CB_ID Internal Tamper 15 Callback ID
  - HAL_RTC_MSPINIT_CB_ID Msp Init callback ID
  - HAL_RTC_MSPDEINIT_CB_ID Msp DeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_RTC_RegisterCallback() may be called before HAL_RTC_Init() in HAL_RTC_STATE_RESET to register callbacks for HAL_RTC_MSPINIT_CB_ID and HAL_RTC_MSPDEINIT_CB_ID.

HAL_RTC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_RTC_UnRegisterCallback (RTC_HandleTypeDef * hrtc, HAL_RTC_CallbackIDTypeDef CallbackID)

Function description

Unregister an RTC Callback RTC callback is redirected to the weak predefined callback.

Parameters

- **hrtc:** RTC handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values: This parameter can be one of the following values:
  - HAL_RTC_ALARM_A_EVENT_CB_ID Alarm A Event Callback ID
  - HAL_RTC_ALARM_B_EVENT_CB_ID Alarm B Event Callback ID
  - HAL_RTC_TIMESTAMP_EVENT_CB_ID TimeStamp Event Callback ID
  - HAL_RTC_SSRU_EVENT_CB_ID SSRU Callback ID
  - HAL_RTC_WAKEUPTIMER_EVENT_CB_ID WakeUp Timer Event Callback ID
  - HAL_RTC_TAMPER1_EVENT_CB_ID Tamper 1 Callback ID
  - HAL_RTC_TAMPER2_EVENT_CB_ID Tamper 2 Callback ID
  - HAL_RTC_TAMPER3_EVENT_CB_ID Tamper 3 Callback ID
  - HAL_RTC_TAMPER4_EVENT_CB_ID Tamper 4 Callback ID
  - HAL_RTC_TAMPER5_EVENT_CB_ID Tamper 5 Callback ID
  - HAL_RTC_TAMPER6_EVENT_CB_ID Tamper 6 Callback ID
  - HAL_RTC_TAMPER7_EVENT_CB_ID Tamper 7 Callback ID
  - HAL_RTC_TAMPER8_EVENT_CB_ID Tamper 8 Callback ID
  - HAL_RTC_INTERNAL_TAMPER1_EVENT_CB_ID Internal Tamper 1 Callback ID
  - HAL_RTC_INTERNAL_TAMPER2_EVENT_CB_ID Internal Tamper 2 Callback ID
  - HAL_RTC_INTERNAL_TAMPER3_EVENT_CB_ID Internal Tamper 3 Callback ID
  - HAL_RTC_INTERNAL_TAMPER4_EVENT_CB_ID Internal Tamper 4 Callback ID
  - HAL_RTC_INTERNAL_TAMPER5_EVENT_CB_ID Internal Tamper 5 Callback ID
  - HAL_RTC_INTERNAL_TAMPER6_EVENT_CB_ID Internal Tamper 6 Callback ID
  - HAL_RTC_INTERNAL_TAMPER7_EVENT_CB_ID Internal Tamper 7 Callback ID
  - HAL_RTC_INTERNAL_TAMPER8_EVENT_CB_ID Internal Tamper 8 Callback ID
  - HAL_RTC_INTERNAL_TAMPER9_EVENT_CB_ID Internal Tamper 9 Callback ID
  - HAL_RTC_INTERNAL_TAMPER11_EVENT_CB_ID Internal Tamper 11 Callback ID
  - HAL_RTC_INTERNAL_TAMPER12_EVENT_CB_ID Internal Tamper 12 Callback ID
  - HAL_RTC_INTERNAL_TAMPER13_EVENT_CB_ID Internal Tamper 13 Callback ID
  - HAL_RTC_INTERNAL_TAMPER15_EVENT_CB_ID Internal Tamper 15 Callback ID
  - HAL_RTC_MSPINIT_CB_ID Msp Init callback ID
  - HAL_RTC_MSPDEINIT_CB_ID Msp DeInit callback ID

Return values

- **HAL:** status

Notes

- The HAL_RTC_UnRegisterCallback() may be called before HAL_RTC_Init() in HAL_RTC_STATE_RESET to un-register callbacks for HAL_RTC_MSPINIT_CB_ID and HAL_RTC_MSPDEINIT_CB_ID.

HAL_RTC_SetTime

Function name

HAL_StatusTypeDef HAL_RTC_SetTime (RTC_HandleTypeDef * hrtc, RTC_TimeTypeDef * sTime, uint32_t Format)

Function description

Set RTC current time.

Parameters

- **hrtc:** RTC handle
- **sTime:** Pointer to Time structure if Binary mode is RTC_BINARY_ONLY, this parameter is not used and RTC_SSR will be automatically reset to 0xFFFFFFFF else sTime->SubSeconds is not used and RTC_SSR will be automatically reset to the A 7-bit async prescaler (RTC_PRER_PREDIV_A)
- **Format:** Format of sTime->Hours, sTime->Minutes and sTime->Seconds. if Binary mode is RTC_BINARY_ONLY, this parameter is not used else this parameter can be one of the following values
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

HAL_RTC_GetTime

Function name

HAL_StatusTypeDef HAL_RTC_GetTime (const RTC_HandleTypeDef * hrtc, RTC_TimeTypeDef * sTime, uint32_t Format)

Function description

Get RTC current time.

Parameters

- **hrtc:** RTC handle
- **sTime:** if Binary mode is RTC_BINARY_ONLY, sTime->SubSeconds only is updated else Pointer to Time structure with Hours, Minutes and Seconds fields returned with input format (BIN or BCD), also SubSeconds field returning the RTC_SSR register content and SecondFraction field the Synchronous pre-scaler factor to be used for second fraction ratio computation.
- **Format:** Format of sTime->Hours, sTime->Minutes and sTime->Seconds. if Binary mode is RTC_BINARY_ONLY, this parameter is not used else this parameter can be one of the following values:
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

Notes

- You can use SubSeconds and SecondFraction (sTime structure fields returned) to convert SubSeconds value in second fraction ratio with time unit following generic formula: Second fraction ratio * time_unit= [(SecondFraction-SubSeconds)/(SecondFraction+1)] * time_unit This conversion can be performed only if no shift operation is pending (ie. SHFP=0) when PREDIV_S >= SS
- You must call HAL_RTC_GetDate() after HAL_RTC_GetTime() to unlock the values in the higher-order calendar shadow registers to ensure consistency between the time and date values. Reading RTC current time locks the values in calendar shadow registers until Current date is read to ensure consistency between the time and date values.

HAL_RTC_SetDate

Function name

HAL_StatusTypeDef HAL_RTC_SetDate (RTC_HandleTypeDef * hrtc, RTC_DateTypeDef * sDate, uint32_t Format)

Function description

Set RTC current date.

Parameters

- **hrtc:** RTC handle
- **sDate:** Pointer to date structure
- **Format:** Format of sDate->Year, sDate->Month and sDate->Weekday. This parameter can be one of the following values:
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

HAL_RTC_GetDate

Function name

HAL_StatusTypeDef HAL_RTC_GetDate (const RTC_HandleTypeDef * hrtc, RTC_DateTypeDef * sDate, uint32_t Format)

Function description

Get RTC current date.

Parameters

- **hrtc:** RTC handle
- **sDate:** Pointer to Date structure
- **Format:** Format of sDate->Year, sDate->Month and sDate->Weekday. This parameter can be one of the following values:
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

Notes

- You must call HAL_RTC_GetDate() after HAL_RTC_GetTime() to unlock the values in the higher-order calendar shadow registers to ensure consistency between the time and date values. Reading RTC current time locks the values in calendar shadow registers until Current date is read.

HAL_RTC_DST_Add1Hour

Function name

void HAL_RTC_DST_Add1Hour (const RTC_HandleTypeDef * hrtc)

Function description

Daylight Saving Time, Add one hour to the calendar in one single operation without going through the initialization procedure.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_DST_Sub1Hour

Function name

void HAL_RTC_DST_Sub1Hour (const RTC_HandleTypeDef * hrtc)

Function description

Daylight Saving Time, Subtract one hour from the calendar in one single operation without going through the initialization procedure.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_DST_SetStoreOperation

Function name

void HAL_RTC_DST_SetStoreOperation (const RTC_HandleTypeDef * hrtc)

Function description

Daylight Saving Time, Set the store operation bit.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

Notes

- It can be used by the software in order to memorize the DST status.

HAL_RTC_DST_ClearStoreOperation

Function name

void HAL_RTC_DST_ClearStoreOperation (const RTC_HandleTypeDef * hrtc)

Function description

Daylight Saving Time, Clear the store operation bit.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_DST_ReadStoreOperation

Function name

uint32_t HAL_RTC_DST_ReadStoreOperation (const RTC_HandleTypeDef * hrtc)

Function description

Daylight Saving Time, Read the store operation bit.

Parameters

- **hrtc:** RTC handle

Return values

- **operation:** see RTC_StoreOperation_Definitions

HAL_RTC_SetAlarm

Function name

HAL_StatusTypeDef HAL_RTC_SetAlarm (RTC_HandleTypeDef * hrtc, RTC_AlarmTypeDef * sAlarm, uint32_t Format)

Function description

Set the specified RTC Alarm.

Parameters

- **hrtc:** RTC handle
- **sAlarm:** Pointer to Alarm structure if Binary mode is RTC_BINARY_ONLY, 3 fields only are used sAlarm->AlarmTime.SubSeconds sAlarm->AlarmSubSecondMask sAlarm->BinaryAutoClr
- **Format:** of the entered parameters. if Binary mode is RTC_BINARY_ONLY, this parameter is not used else this parameter can be one of the following values
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

HAL_RTC_SetAlarm_IT

Function name

HAL_StatusTypeDef HAL_RTC_SetAlarm_IT (RTC_HandleTypeDef * hrtc, RTC_AlarmTypeDef * sAlarm, uint32_t Format)

Function description

Set the specified RTC Alarm with Interrupt.

Parameters

- **hrtc:** RTC handle
- **sAlarm:** Pointer to Alarm structure if Binary mode is RTC_BINARY_ONLY, 3 fields only are used sAlarm->AlarmTime.SubSeconds sAlarm->AlarmSubSecondMask sAlarm->BinaryAutoClr
- **Format:** Specifies the format of the entered parameters. if Binary mode is RTC_BINARY_ONLY, this parameter is not used else this parameter can be one of the following values
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

Notes

- The application must ensure that the EXTI RTC interrupt line is enabled.

HAL_RTC_DeactivateAlarm

Function name

HAL_StatusTypeDef HAL_RTC_DeactivateAlarm (RTC_HandleTypeDef * hrtc, uint32_t Alarm)

Function description

Deactivate the specified RTC Alarm.

Parameters

- **hrtc:** RTC handle
- **Alarm:** Specifies the Alarm. This parameter can be one of the following values:
  - RTC_ALARM_A: AlarmA
  - RTC_ALARM_B: AlarmB

Return values

- **HAL:** status

HAL_RTC_GetAlarm

Function name

HAL_StatusTypeDef HAL_RTC_GetAlarm (const RTC_HandleTypeDef * hrtc, RTC_AlarmTypeDef * sAlarm, uint32_t Alarm, uint32_t Format)

Function description

Get the RTC Alarm value and masks.

Parameters

- **hrtc:** RTC handle
- **sAlarm:** Pointer to Date structure
- **Alarm:** Specifies the Alarm. This parameter can be one of the following values:
  - RTC_ALARM_A: AlarmA
  - RTC_ALARM_B: AlarmB
- **Format:** Specifies the format of the entered parameters. This parameter can be one of the following values:
  - RTC_FORMAT_BIN: Binary format
  - RTC_FORMAT_BCD: BCD format

Return values

- **HAL:** status

HAL_RTC_AlarmIRQHandler

Function name

void HAL_RTC_AlarmIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

Handle Alarm secure interrupt request.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_PollForAlarmAEvent

Function name

HAL_StatusTypeDef HAL_RTC_PollForAlarmAEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

Handle Alarm A Polling request.

Parameters

- **hrtc:** RTC handle
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_RTC_AlarmAEventCallback

Function name

void HAL_RTC_AlarmAEventCallback (RTC_HandleTypeDef * hrtc)

Function description

Alarm A secure callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTC_WaitForSynchro

Function name

HAL_StatusTypeDef HAL_RTC_WaitForSynchro (RTC_HandleTypeDef * hrtc)

Function description

Wait until the RTC Time and Date registers (RTC_TR and RTC_DR) are synchronized with RTC APB clock.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- The RTC Resynchronization mode is write protected, use the __HAL_RTC_WRITEPROTECTION_DISABLE() before calling this function.
- To read the calendar through the shadow registers after Calendar initialization, calendar update or after wakeup from low power modes the software must first clear the RSF flag. The software must then wait until it is set again before reading the calendar, which means that the calendar registers have been correctly copied into the RTC_TR and RTC_DR shadow registers.

HAL_RTC_GetState

Function name

HAL_RTCStateTypeDef HAL_RTC_GetState (const RTC_HandleTypeDef * hrtc)

Function description

Return the RTC handle state.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** state

RTC_EnterInitMode

Function name

HAL_StatusTypeDef RTC_EnterInitMode (RTC_HandleTypeDef * hrtc)

Function description

Enter the RTC Initialization mode.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- The RTC Initialization mode is write protected, use the __HAL_RTC_WRITEPROTECTION_DISABLE() before calling this function.

RTC_ExitInitMode

Function name

HAL_StatusTypeDef RTC_ExitInitMode (RTC_HandleTypeDef * hrtc)

Function description

Exit the RTC Initialization mode.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

RTC_ByteToBcd2

Function name

uint8_t RTC_ByteToBcd2 (uint8_t Value)

Function description

Convert a 2 digit decimal to BCD format.

Parameters

- **Value:** Byte to be converted

Return values

- **Converted:** byte

RTC_Bcd2ToByte

Function name

uint8_t RTC_Bcd2ToByte (uint8_t Value)

Function description

Convert from 2 digit BCD to Binary.

Parameters

- **Value:** BCD value to be converted

Return values

- **Converted:** word

63.3 RTC Firmware driver defines

The following section lists the various define and macros of the module.

63.3.1 RTC

RTC

RTC DayLightSaving Definitions

RTC_DAYLIGHTSAVING_SUB1H

RTC_DAYLIGHTSAVING_ADD1H

RTC_DAYLIGHTSAVING_NONE

RTC Exported Macros

__HAL_RTC_RESET_HANDLE_STATE

Description:

- Reset RTC handle state.

Parameters:

- __HANDLE__: RTC handle.

Return value:

- None

__HAL_RTC_WRITEPROTECTION_DISABLE

Description:

- Disable the write protection for RTC registers.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_WRITEPROTECTION_ENABLE

Description:

- Enable the write protection for RTC registers.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_DAYLIGHT_SAVING_TIME_ADD1H

Description:

- Add 1 hour (summer time change).

Parameters:

- __HANDLE__: specifies the RTC handle.
- __BKP__: Backup This parameter can be:
  - RTC_STOREOPERATION_RESET
  - RTC_STOREOPERATION_SET

Return value:

- None

Notes:

- This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions

__HAL_RTC_DAYLIGHT_SAVING_TIME_SUB1H

Description:

- Subtract 1 hour (winter time change).

Parameters:

- __HANDLE__: specifies the RTC handle.
- __BKP__: Backup This parameter can be:
  - RTC_STOREOPERATION_RESET
  - RTC_STOREOPERATION_SET

Return value:

- None

Notes:

- This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions

__HAL_RTC_ALARMA_ENABLE

Description:

- Enable the RTC ALARMA peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARMA_DISABLE

Description:

- Disable the RTC ALARMA peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARMB_ENABLE

Description:

- Enable the RTC ALARMB peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARMB_DISABLE

Description:

- Disable the RTC ALARMB peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARM_ENABLE_IT

Description:

- Enable the RTC Alarm interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- None

__HAL_RTC_ALARM_DISABLE_IT

Description:

- Disable the RTC Alarm interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- None

__HAL_RTC_ALARM_GET_IT

Description:

- Check whether the specified RTC Alarm interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to check. This parameter can be:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- None

__HAL_RTC_ALARM_GET_IT_SOURCE

Description:

- Check whether the specified RTC Alarm interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to check. This parameter can be:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- None

__HAL_RTC_ALARM_GET_FLAG

Description:

- Get the selected RTC Alarms flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Alarm Flag sources to check. This parameter can be:
  - RTC_FLAG_ALRAF
  - RTC_FLAG_ALRBF

Return value:

- None

__HAL_RTC_ALARM_CLEAR_FLAG

Description:

- Clear the RTC Alarms pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Alarm Flag sources to clear. This parameter can be:
  - RTC_FLAG_ALRAF
  - RTC_FLAG_ALRBF

Return value:

- None

__HAL_RTC_IS_CALENDAR_INITIALIZED

Description:

- Check whether if the RTC Calendar is initialized.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

64 HAL RTC Extension Driver

64.1 RTCEx Firmware driver registers structures

64.1.1 RTC_TamperTypeDef

RTC_TamperTypeDef is defined in the stm32h5xx_hal_rtc_ex.h

Data Fields

- ***uint32_t Tamper***
- ***uint32_t Trigger***
- ***uint32_t NoErase***
- ***uint32_t MaskFlag***
- ***uint32_t Filter***
- ***uint32_t SamplingFrequency***
- ***uint32_t PrechargeDuration***
- ***uint32_t TamperPullUp***
- ***uint32_t TimeStampOnTamperDetection***

Field Documentation

- ***uint32_t RTC_TamperTypeDef::Tamper***
  Specifies the Tamper Pin. This parameter can be a value of ***RTCEx_Tamper_Pins***
- ***uint32_t RTC_TamperTypeDef::Trigger***
  Specifies the Tamper Trigger. This parameter can be a value of ***RTCEx_Tamper_Trigger***
- ***uint32_t RTC_TamperTypeDef::NoErase***
  Specifies the Tamper no erase mode. This parameter can be a value of ***RTCEx_Tamper_EraseBackUp***
- ***uint32_t RTC_TamperTypeDef::MaskFlag***
  Specifies the Tamper Flag masking. This parameter can be a value of ***RTCEx_Tamper_MaskFlag***
- ***uint32_t RTC_TamperTypeDef::Filter***
  Specifies the TAMP Filter Tamper. This parameter can be a value of ***RTCEx_Tamper_Filter***
- ***uint32_t RTC_TamperTypeDef::SamplingFrequency***
  Specifies the sampling frequency. This parameter can be a value of ***RTCEx_Tamper_Sampling_Frequencies***
- ***uint32_t RTC_TamperTypeDef::PrechargeDuration***
  Specifies the Precharge Duration. This parameter can be a value of ***RTCEx_Tamper_Pin_Precharge_Duration***
- ***uint32_t RTC_TamperTypeDef::TamperPullUp***
  Specifies the Tamper PullUp. This parameter can be a value of ***RTCEx_Tamper_Pull_UP***
- ***uint32_t RTC_TamperTypeDef::TimeStampOnTamperDetection***
  Specifies the TimeStampOnTamperDetection. This parameter can be a value of ***RTCEx_Tamper_TimeStampOnTamperDetection***

64.1.2 RTC_ATampInputTypeDef

RTC_ATampInputTypeDef is defined in the stm32h5xx_hal_rtc_ex.h

Data Fields

- ***uint32_t Enable***
- ***uint32_t Interrupt***
- ***uint32_t Output***
- ***uint32_t NoErase***
- ***uint32_t MaskFlag***

Field Documentation

- ***uint32_t RTC_ATampInputTypeDef::Enable***
  Specifies the Tamper input is active. This parameter can be a value of ***RTCEx_ActiveTamper_Enable***

- ***uint32_t RTC_ATampInputTypeDef::Interrupt***
  Specifies the interrupt mode. This parameter can be a value of ***RTCEx_ActiveTamper_Interrupt***
- ***uint32_t RTC_ATampInputTypeDef::Output***
  Specifies the TAMP output to be compared with. The same output can be used for several tamper inputs. This parameter can be a value of ***RTCEx_ActiveTamper_Sel***
- ***uint32_t RTC_ATampInputTypeDef::NoErase***
  Specifies the Tamper no erase mode. This parameter can be a value of ***RTCEx_Tamper_EraseBackUp***
- ***uint32_t RTC_ATampInputTypeDef::MaskFlag***
  Specifies the Tamper Flag masking. This parameter can be a value of ***RTCEx_Tamper_MaskFlag***

64.1.3 RTC_ActiveTampersTypeDef

RTC_ActiveTampersTypeDef is defined in the stm32h5xx_hal_rtc_ex.h

Data Fields

- ***uint32_t ActiveFilter***
- ***uint32_t ActiveAsyncPrescaler***
- ***uint32_t TimeStampOnTamperDetection***
- ***uint32_t ActiveOutputChangePeriod***
- ***uint32_t Seed***
- ***RTC_ATampInputTypeDef TampInput***

Field Documentation

- ***uint32_t RTC_ActiveTampersTypeDef::ActiveFilter***
  Specifies the Active tamper filter enable. This parameter can be a value of ***RTCEx_ActiveTamper_Filter***
- ***uint32_t RTC_ActiveTampersTypeDef::ActiveAsyncPrescaler***
  Specifies the Active Tamper asynchronous Prescaler clock. This parameter can be a value of ***RTCEx_ActiveTamper_Async_prescaler***
- ***uint32_t RTC_ActiveTampersTypeDef::TimeStampOnTamperDetection***
  Specifies the timeStamp on tamper detection. This parameter can be a value of ***RTCEx_Tamper_TimeStampOnTamperDetection***
- ***uint32_t RTC_ActiveTampersTypeDef::ActiveOutputChangePeriod***
  Specifies the Active Tamper output change period. This parameter can be a value from 0 to 7
- ***uint32_t RTC_ActiveTampersTypeDef::Seed[RTC_ATAMP_SEED_NB_UINT32]***
  Specifies the RNG Seed value. This parameter is an array of value from 0 to 0xFFFFFFFF
- ***RTC_ATampInputTypeDef RTC_ActiveTampersTypeDef::TampInput[RTC_TAMP_NB]***
  Specifies configuration of all active tampers. The index of TampInput[RTC_TAMP_NB] can be a value of RTCEx_ActiveTamper_Sel

64.1.4 RTC_InternalTamperTypeDef

RTC_InternalTamperTypeDef is defined in the stm32h5xx_hal_rtc_ex.h

Data Fields

- ***uint32_t IntTamper***
- ***uint32_t TimeStampOnTamperDetection***
- ***uint32_t NoErase***

Field Documentation

- ***uint32_t RTC_InternalTamperTypeDef::IntTamper***
  Specifies the Internal Tamper Pin. This parameter can be a value of ***RTCEx_Internal_Tamper_Pins***
- ***uint32_t RTC_InternalTamperTypeDef::TimeStampOnTamperDetection***
  Specifies the TimeStampOnTamperDetection. This parameter can be a value of ***RTCEx_Tamper_TimeStampOnTamperDetection***
- ***uint32_t RTC_InternalTamperTypeDef::NoErase***
  Specifies the internal Tamper no erase mode. This parameter can be a value of ***RTCEx_Tamper_EraseBackUp***

64.1.5 RTC_SecureStateTypeDef

RTC_SecureStateTypeDef is defined in the stm32h5xx_hal_rtc_ex.h

Data Fields

- ***uint32_t rtcSecureFull***
- ***uint32_t rtcNonSecureFeatures***
- ***uint32_t tampSecureFull***
- ***uint32_t backupRegisterStartZone2***
- ***uint32_t backupRegisterStartZone3***
- ***uint32_t MonotonicCounterSecure***

Field Documentation

- ***uint32_t RTC_SecureStateTypeDef::rtcSecureFull***
  Specifies If the RTC is fully secure or not. This parameter can be a value of ***RTCEx_RTC_Secure_Full***
- ***uint32_t RTC_SecureStateTypeDef::rtcNonSecureFeatures***
  Specifies the non-secure features. This parameter is only relevant if RTC is not fully secure (rtcSecureFull == RTC_SECURE_FULL_NO). This parameter can be a combination of ***RTCEx_RTC_NonSecure_Features***
- ***uint32_t RTC_SecureStateTypeDef::tampSecureFull***
  Specifies If the TAMP is fully secure or not execpt monotonic counters and BackUp registers. This parameter can be a value of ***RTCEx_TAMP_Secure_Full***
- ***uint32_t RTC_SecureStateTypeDef::backupRegisterStartZone2***
  Specifies the backup register start zone 2. Zone 1 : read secure write secure. Zone 2 : read non-secure write secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register. Warning : this parameter is shared with ***Section 63.3.1 RTC_PrivilegeStateTypeDef***
- ***uint32_t RTC_SecureStateTypeDef::backupRegisterStartZone3***
  Specifies the backup register start zone 3. Zone 3 : read non-secure write non-secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register. Warning : this parameter is shared with ***Section 63.3.1 RTC_PrivilegeStateTypeDef***
- ***uint32_t RTC_SecureStateTypeDef::MonotonicCounterSecure***
  Specifies If the monotonic counter is secure or not. This parameter can be a value of ***RTCEx_TAMP_Monotonic_Counter_Secure***

64.1.6 RTC_PrivilegeStateTypeDef

RTC_PrivilegeStateTypeDef is defined in the stm32h5xx_hal_rtc_ex.h

Data Fields

- ***uint32_t rtcPrivilegeFull***
- ***uint32_t rtcPrivilegeFeatures***
- ***uint32_t tampPrivilegeFull***
- ***uint32_t backupRegisterPrivZone***
- ***uint32_t backupRegisterStartZone2***
- ***uint32_t backupRegisterStartZone3***
- ***uint32_t MonotonicCounterPrivilege***

Field Documentation

- ***uint32_t RTC_PrivilegeStateTypeDef::rtcPrivilegeFull***
  Specifies If the RTC is fully privileged or not. This parameter can be a value of ***RTCEx_RTC_Privilege_Full***
- ***uint32_t RTC_PrivilegeStateTypeDef::rtcPrivilegeFeatures***
  Specifies the privileged features. This parameter is only relevant if RTC is not fully privileged (rtcPrivilegeFull == RTC_PRIVILEGE_FULL_NO). This parameter can be a combination of ***RTCEx_RTC_Privilege_Features***
- ***uint32_t RTC_PrivilegeStateTypeDef::tampPrivilegeFull***
  Specifies If the TAMP is fully privileged or not execpt monotonic counters and BackUp registers. This parameter can be a value of ***RTCEx_TAMP_Privilege_Full***
- ***uint32_t RTC_PrivilegeStateTypeDef::backupRegisterPrivZone***
  Specifies backup register zone to be privileged. This parameter can be a combination of ***RTCEx_Backup_Reg_Privilege_zone***. Warning : this parameter is writable in secure mode or if trustzone is disabled

- ***uint32_t RTC_PrivilegeStateTypeDef::backupRegisterStartZone2***
  Specifies the backup register start zone 2. Zone 1 : read secure write secure. Zone 2 : read non-secure write secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register . Warning : this parameter is writable in secure mode or if trustzone is disabled. Warning : this parameter is shared with ***Section 63.3.1 RTC_SecureStateTypeDef***
- ***uint32_t RTC_PrivilegeStateTypeDef::backupRegisterStartZone3***
  Specifies the backup register start zone 3. Zone 3 : read non-secure write non-secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register. Warning : this parameter is writable in secure mode or if trustzone is disabled. Warning : this parameter is shared with ***Section 63.3.1 RTC_SecureStateTypeDef***
- ***uint32_t RTC_PrivilegeStateTypeDef::MonotonicCounterPrivilege***
  Specifies If the monotonic counter is privileged or not. This parameter can be a value of ***RTCEx_TAMP_Monotonic_Counter_Privilege***

64.2 RTCEx Firmware driver API description

The following section lists the various functions of the RTCEx library.

64.2.1 How to use this driver

- Enable the RTC domain access.
- Configure the RTC Prescaler (Asynchronous and Synchronous) and RTC hour format using the HAL_RTC_Init() function.

RTC Wakeup configuration

- To configure the RTC Wakeup Clock source and Counter use the HAL_RTCEx_SetWakeUpTimer() function. You can also configure the RTC Wakeup timer with interrupt mode using the HAL_RTCEx_SetWakeUpTimer_IT() function.
- To read the RTC WakeUp Counter register, use the HAL_RTCEx_GetWakeUpTimer() function.

Outputs configuration

The RTC has 2 outputs pins (RTC_OUT1 & RTC_OUT2). To configure the outputs, use the HAL_RTC_Init() function.

- RTC_OUT1 and RTC_OUT2 which select one of the following two outputs:
- CALIB: 512Hz or 1Hz clock output (with an LSE frequency of 32.768kHz). To enable the CALIB, use the HAL_RTCEx_SetCalibrationOutPut() function.
- TAMPALRM: This output is the OR between rtc_tamp_evt and ALARM signals. ALARM is enabled by configuring the OSEL[1:0] bits in the RTC_CR register which select the alarm A, alarm B or wakeup outputs. rtc_tamp_evt is enabled by setting the TAMPOE bit in the RTC_CR register which selects the tamper event outputs.

Smooth digital Calibration configuration

- Configure the RTC Original Digital Calibration Value and the corresponding calibration cycle period (32s,16s and 8s) using the HAL_RTCEx_SetSmoothCalib() function.

RTC synchronization

- The RTC can be finely adjusted using HAL_RTCEx_SetSynchroShift() function. Writing to RTC_SHIFTR can shift (either delay or advance) the clock with a resolution of 1 ck_apre period. The shift operation consists in adding the SUBFS[14:0] value to the synchronous prescaler counter SS[15:0]: this delays the clock.

Bypass shadow registers

- Enable bypass shadow registers using the HAL_RTCEx_EnableBypassShadow(). When the Bypass Shadow is enabled the calendar value are taken directly from the Calendar counter. Thus eliminating the need to wait for the RSF bit to be set. This is especially useful after exiting from low-power modes (Stop or Standby), since the shadow registers are not updated during these modes.

RTC ultra-low-power mode

- Configure the RTC ultra-low-power mode using HAL_RTCEx_SetLowPowerCalib() function. In this case, the calibration mechanism is applied on ck_apre instead of RTCCLK. The resulting accuracy is the same, but the calibration is performed during a calibration cycle of about 220 x PREDIV_A x RTCCLK pulses instead of 220 RTCCLK pulses.

RTC subsecond register underflow interruption

- Enable the RTC SSRU interruption mode using HAL_RTCEx_SetSSRU_IT() function. In this case, when the SSR rolls under 0, an SSRU interruption is triggered. Disable the RTC SSRU interruption mode using HAL_RTCEx_DeactivateSSRU() function.

TimeStamp configuration

- Enable the RTC TimeStamp using the HAL_RTCEx_SetTimeStamp() function. You can also configure the RTC TimeStamp with interrupt mode using the HAL_RTCEx_SetTimeStamp_IT() function.
- To read the RTC TimeStamp Time and Date register, use the HAL_RTCEx_GetTimeStamp() function.

Internal TimeStamp configuration

- Enable the RTC internal TimeStamp using the HAL_RTCEx_SetInternalTimeStamp() function. User has to check internal timestamp occurrence using __HAL_RTC_INTERNAL_TIMESTAMP_GET_FLAG.
- To read the RTC TimeStamp Time and Date register, use the HAL_RTCEx_GetTimeStamp() function.

Tamper configuration

- Enable the RTC Tamper and configure the Tamper filter count, trigger Edge or Level according to the Tamper filter (if equal to 0 Edge else Level) value, sampling frequency, NoErase, MaskFlag, precharge or discharge and Pull-UP using the HAL_RTCEx_SetTamper() function. You can configure RTC Tamper with interrupt mode using HAL_RTCEx_SetTamper_IT() function.
- The default configuration of the Tamper erases the backup registers. To avoid erase, enable the NoErase field on the TAMP_CR2 register.
- With new RTC tamper configuration, you have to call HAL_RTC_Init() in order to perform TAMP base address offset calculation.
- Enable Internal tamper using HAL_RTCEx_SetInternalTamper. IT mode can be chosen using setting Interrupt field.

Backup Data Registers and Device Secrets configuration

- To write to the RTC Backup Data registers, use the HAL_RTCEx_BKUPWrite() function.
- To read the RTC Backup registers, use the HAL_RTCEx_BKUPRead() function.
- To reset the RTC Backup registers and erase the device secrets, use HAL_RTCEx_BKUPErase() function.
- Enable the lock of the Boot hardware Key using the HAL_RTCEx_LockBootHardwareKey() function. The backup registers from TAMP_BKP0R to TAMP_BKP7R cannot be accessed neither in read nor in write (they are read as 0 and write ignore).
- Configure the erase of the Device Secrets using HAL_RTCEx_ConfigEraseDeviceSecrets() function.
- Block the access to the RTC Backup registers and all the device secrets using HAL_RTCEx_BKUPBlock() function.

Monotonic counter

- To increment the Monotonic counter, use the HAL_RTCEx_MonotonicCounterIncrement() function.
- To get the current value of the Monotonic counter, use the HAL_RTCEx_MonotonicCounterGet() function.

RTC & TAMP secure protection modes

- Set the security level of the RTC/TAMP/Backup registers using HAL_RTCEx_SecureModeSet() function. +) Get the security level of the RTC/TAMP/Backup registers using HAL_RTCEx_SecureModeGet() function.

RTC & TAMP privilege protection modes

- Set the privilege level of the RTC/TAMP/Backup registers using HAL_RTCEx_PrivilegeModeSet() function.
  +) Get the privilege level of the RTC/TAMP/Backup registers using HAL_RTCEx_PrivilegeModeGet() function.

64.2.2 RTC TimeStamp and Tamper functions

This section provides functions allowing to configure TimeStamp feature

This section contains the following APIs:

- *HAL_RTCEx_SetTimeStamp()*
- *HAL_RTCEx_SetTimeStamp_IT()*
- *HAL_RTCEx_DeactivateTimeStamp()*
- *HAL_RTCEx_SetInternalTimeStamp()*
- *HAL_RTCEx_DeactivateInternalTimeStamp()*
- *HAL_RTCEx_GetTimeStamp()*
- *HAL_RTCEx_TimeStampIRQHandler()*
- *HAL_RTCEx_TimeStampEventCallback()*
- *HAL_RTCEx_PollForTimeStampEvent()*

64.2.3 RTC Wake-up functions

This section provides functions allowing to configure Wake-up feature

This section contains the following APIs:

- *HAL_RTCEx_SetWakeUpTimer()*
- *HAL_RTCEx_SetWakeUpTimer_IT()*
- *HAL_RTCEx_DeactivateWakeUpTimer()*
- *HAL_RTCEx_GetWakeUpTimer()*
- *HAL_RTCEx_WakeUpTimerIRQHandler()*
- *HAL_RTCEx_WakeUpTimerEventCallback()*
- *HAL_RTCEx_PollForWakeUpTimerEvent()*

64.2.4 Extended Peripheral Control functions

This subsection provides functions allowing to

- Write a data in a specified RTC Backup data register
- Read a data in a specified RTC Backup data register
- Set the Coarse calibration parameters.
- Deactivate the Coarse calibration parameters
- Set the Smooth calibration parameters.
- Set Low Power calibration parameter.
- Configure the Synchronization Shift Control Settings.
- Configure the Calibration Pinout (RTC_CALIB) Selection (1Hz or 512Hz).
- Deactivate the Calibration Pinout (RTC_CALIB) Selection (1Hz or 512Hz).
- Enable the RTC reference clock detection.
- Disable the RTC reference clock detection.
- Enable the Bypass Shadow feature.
- Disable the Bypass Shadow feature.

This section contains the following APIs:

- *HAL_RTCEx_SetSmoothCalib()*
- *HAL_RTCEx_SetLowPowerCalib()*
- *HAL_RTCEx_SetSynchroShift()*
- *HAL_RTCEx_SetCalibrationOutPut()*

- *HAL_RTCEx_DeactivateCalibrationOutPut()*
- *HAL_RTCEx_SetRefClock()*
- *HAL_RTCEx_DeactivateRefClock()*
- *HAL_RTCEx_EnableBypassShadow()*
- *HAL_RTCEx_DisableBypassShadow()*
- *HAL_RTCEx_MonotonicCounterIncrement()*
- *HAL_RTCEx_MonotonicCounterGet()*
- *HAL_RTCEx_SetSSRU_IT()*
- *HAL_RTCEx_DeactivateSSRU()*
- *HAL_RTCEx_SSRUIRQHandler()*
- *HAL_RTCEx_SSRUEventCallback()*

64.2.5 Extended features functions

This section provides functions allowing to:

- RTC Alarm B callback
- RTC Poll for Alarm B request

This section contains the following APIs:

- *HAL_RTCEx_AlarmBEventCallback()*
- *HAL_RTCEx_PollForAlarmBEvent()*

64.2.6 Tamper functions

- Before calling any tamper or internal tamper function, you have to call first HAL_RTC_Init() function.
- In that one you can select to output tamper event on RTC pin.
- Enable the Tamper and configure the Tamper filter count, trigger Edge or Level according to the Tamper filter (if equal to 0 Edge else Level) value, sampling frequency, NoErase, MaskFlag, precharge or discharge and Pull-UP, timestamp using the HAL_RTCEx_SetTamper() function. You can configure Tamper with interrupt mode using HAL_RTCEx_SetTamper_IT() function.
- The default configuration of the Tamper erases the backup registers. To avoid erase, enable the NoErase field on the TAMP_TAMPCR register.
- Enable Internal Tamper and configure it with interrupt, timestamp using the HAL_RTCEx_SetInternalTamper() function.

This section contains the following APIs:

- *HAL_RTCEx_SetTamper()*
- *HAL_RTCEx_SetTamper_IT()*
- *HAL_RTCEx_DeactivateTamper()*
- *HAL_RTCEx_SetActiveTampers()*
- *HAL_RTCEx_SetActiveSeed()*
- *HAL_RTCEx_LockBootHardwareKey()*
- *HAL_RTCEx_DeactivateActiveTampers()*
- *HAL_RTCEx_PollForTamperEvent()*
- *HAL_RTCEx_SetInternalTamper()*
- *HAL_RTCEx_SetInternalTamper_IT()*
- *HAL_RTCEx_DeactivateInternalTamper()*
- *HAL_RTCEx_PollForInternalTamperEvent()*
- *HAL_RTCEx_TamperIRQHandler()*
- *HAL_RTCEx_Tamper1EventCallback()*
- *HAL_RTCEx_Tamper2EventCallback()*
- *HAL_RTCEx_Tamper3EventCallback()*
- *HAL_RTCEx_Tamper4EventCallback()*
- *HAL_RTCEx_Tamper5EventCallback()*

- *HAL_RTCEx_Tamper6EventCallback()*
- *HAL_RTCEx_Tamper7EventCallback()*
- *HAL_RTCEx_Tamper8EventCallback()*
- *HAL_RTCEx_InternalTamper1EventCallback()*
- *HAL_RTCEx_InternalTamper2EventCallback()*
- *HAL_RTCEx_InternalTamper3EventCallback()*
- *HAL_RTCEx_InternalTamper4EventCallback()*
- *HAL_RTCEx_InternalTamper5EventCallback()*
- *HAL_RTCEx_InternalTamper6EventCallback()*
- *HAL_RTCEx_InternalTamper7EventCallback()*
- *HAL_RTCEx_InternalTamper8EventCallback()*
- *HAL_RTCEx_InternalTamper9EventCallback()*
- *HAL_RTCEx_InternalTamper11EventCallback()*
- *HAL_RTCEx_InternalTamper12EventCallback()*
- *HAL_RTCEx_InternalTamper13EventCallback()*
- *HAL_RTCEx_InternalTamper15EventCallback()*

64.2.7 Extended RTC Backup register functions

- Before calling any tamper or internal tamper function, you have to call first HAL_RTC_Init() function.
- In that one you can select to output tamper event on RTC pin.

This subsection provides functions allowing to

- Write a data in a specified RTC Backup data register
- Read a data in a specified RTC Backup data register

This section contains the following APIs:

- *HAL_RTCEx_BKUPWrite()*
- *HAL_RTCEx_BKUPRead()*
- *HAL_RTCEx_BKUPErase()*
- *HAL_RTCEx_BKUPBlock()*
- *HAL_RTCEx_BKUPUnblock()*
- *HAL_RTCEx_ConfigEraseDeviceSecrets()*

64.2.8 Extended RTC security functions

- Before calling security function, you have to call first HAL_RTC_Init() function.

This section contains the following APIs:

- *HAL_RTCEx_SecureModeGet()*
- *HAL_RTCEx_SecureModeSet()*

64.2.9 Extended RTC privilege functions

- Before calling privilege function, you have to call first HAL_RTC_Init() function.

This section contains the following APIs:

- *HAL_RTCEx_PrivilegeModeSet()*
- *HAL_RTCEx_PrivilegeModeGet()*

64.2.10 Detailed description of functions

HAL_RTCEx_SetTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTimeStamp (RTC_HandleTypeDef * hrtc, uint32_t TimeStampEdge, uint32_t RTC_TimeStampPin)

Function description

Set TimeStamp.

Parameters

- **hrtc:** RTC handle
- **TimeStampEdge:** Specifies the pin edge on which the TimeStamp is activated. This parameter can be one of the following values:
  - RTC_TIMESTAMPEDGE_RISING: the Time stamp event occurs on the rising edge of the related pin.
  - RTC_TIMESTAMPEDGE_FALLING: the Time stamp event occurs on the falling edge of the related pin.
- **RTC_TimeStampPin:** specifies the RTC TimeStamp Pin. This parameter can be one of the following values:
  - RTC_TIMESTAMPPIN_DEFAULT: PC13 is selected as RTC TimeStamp Pin. The RTC TimeStamp Pin is per default PC13, but for reasons of compatibility, this parameter is required.

Return values

- **HAL:** status

Notes

- This API must be called before enabling the TimeStamp feature.

HAL_RTCEx_SetTimeStamp_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTimeStamp_IT (RTC_HandleTypeDef * hrtc, uint32_t TimeStampEdge, uint32_t RTC_TimeStampPin)

Function description

Set TimeStamp with Interrupt.

Parameters

- **hrtc:** RTC handle
- **TimeStampEdge:** Specifies the pin edge on which the TimeStamp is activated. This parameter can be one of the following values:
  - RTC_TIMESTAMPEDGE_RISING: the Time stamp event occurs on the rising edge of the related pin.
  - RTC_TIMESTAMPEDGE_FALLING: the Time stamp event occurs on the falling edge of the related pin.
- **RTC_TimeStampPin:** Specifies the RTC TimeStamp Pin. This parameter can be one of the following values:
  - RTC_TIMESTAMPPIN_DEFAULT: PC13 is selected as RTC TimeStamp Pin. The RTC TimeStamp Pin is per default PC13, but for reasons of compatibility, this parameter is required.

Return values

- **HAL:** status

Notes

- This API must be called before enabling the TimeStamp feature.
- The application must ensure that the EXTI RTC interrupt line is enabled.

HAL_RTCEx_DeactivateTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateTimeStamp (RTC_HandleTypeDef * hrtc)

Function description

Deactivate TimeStamp.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_SetInternalTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_SetInternalTimeStamp (RTC_HandleTypeDef * hrtc)

Function description

Set Internal TimeStamp.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- This API must be called before enabling the internal TimeStamp feature.

HAL_RTCEx_DeactivateInternalTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateInternalTimeStamp (RTC_HandleTypeDef * hrtc)

Function description

Deactivate Internal TimeStamp.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_GetTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_GetTimeStamp (const RTC_HandleTypeDef * hrtc, RTC_TimeTypeDef * sTimeStamp, RTC_DateTypeDef * sTimeStampDate, uint32_t Format)

Function description

Get the RTC TimeStamp value.

Parameters

- **hrtc:** RTC handle
- **sTimeStamp:** Pointer to Time structure
- **sTimeStampDate:** Pointer to Date structure
- **Format:** specifies the format of the entered parameters. This parameter can be one of the following values:
  - RTC_FORMAT_BIN: Binary data format
  - RTC_FORMAT_BCD: BCD data format

Return values

- **HAL:** status

HAL_RTCEx_TimeStampIRQHandler

Function name

void HAL_RTCEx_TimeStampIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

Handle TimeStamp interrupt request.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_PollForTimeStampEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForTimeStampEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

Handle TimeStamp polling request.

Parameters

- **hrtc:** RTC handle
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_RTCEx_TimeStampEventCallback

Function name

void HAL_RTCEx_TimeStampEventCallback (RTC_HandleTypeDef * hrtc)

Function description

TimeStamp callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_SetWakeUpTimer

Function name

HAL_StatusTypeDef HAL_RTCEx_SetWakeUpTimer (RTC_HandleTypeDef * hrtc, uint32_t WakeUpCounter, uint32_t WakeUpClock)

Function description

Set wake up timer.

Parameters

- **hrtc:** RTC handle
- **WakeUpCounter:** Wake up counter
- **WakeUpClock:** Wake up clock

Return values

- **HAL:** status

HAL_RTCEx_SetWakeUpTimer_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetWakeUpTimer_IT (RTC_HandleTypeDef * hrtc, uint32_t WakeUpCounter, uint32_t WakeUpClock, uint32_t WakeUpAutoClr)

Function description

Set wake up timer with interrupt.

Parameters

- **hrtc:** RTC handle
- **WakeUpCounter:** Wake up counter
- **WakeUpClock:** Wake up clock
- **WakeUpAutoClr:** Wake up auto clear value (look at WUTOCLR in reference manual)
  - No effect if WakeUpAutoClr is set to zero
  - This feature is meaningful in case of Low power mode to avoid any RTC software execution after Wake Up.

Return values

- **HAL:** status

Notes

- The application must ensure that the EXTI RTC interrupt line is enabled.

HAL_RTCEx_DeactivateWakeUpTimer

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateWakeUpTimer (RTC_HandleTypeDef * hrtc)

Function description

Deactivate wake up timer counter.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_GetWakeUpTimer

Function name

uint32_t HAL_RTCEx_GetWakeUpTimer (const RTC_HandleTypeDef * hrtc)

Function description

Get wake up timer counter.

Parameters

- **hrtc:** RTC handle

Return values

- **Counter:** value

HAL_RTCEx_WakeUpTimerIRQHandler

Function name

void HAL_RTCEx_WakeUpTimerIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

Handle Wake Up Timer interrupt request.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_WakeUpTimerEventCallback

Function name

void HAL_RTCEx_WakeUpTimerEventCallback (RTC_HandleTypeDef * hrtc)

Function description

Wake Up Timer callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_PollForWakeUpTimerEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForWakeUpTimerEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

Handle Wake Up Timer Polling.

Parameters

- **hrtc:** RTC handle
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_RTCEx_SetSmoothCalib

Function name

HAL_StatusTypeDef HAL_RTCEx_SetSmoothCalib (RTC_HandleTypeDef * hrtc, uint32_t SmoothCalibPeriod, uint32_t SmoothCalibPlusPulses, uint32_t SmoothCalibMinusPulsesValue)

Function description

Set the Smooth calibration parameters.

Parameters

- **hrtc:** RTC handle
- **SmoothCalibPeriod:** Select the Smooth Calibration Period. This parameter can be one of the following values :
  - RTC_SMOOTHCALIB_PERIOD_32SEC: The smooth calibration period is 32s.
  - RTC_SMOOTHCALIB_PERIOD_16SEC: The smooth calibration period is 16s.
  - RTC_SMOOTHCALIB_PERIOD_8SEC: The smooth calibration period is 8s.
- **SmoothCalibPlusPulses:** Select to Set or reset the CALP bit. This parameter can be one of the following values:
  - RTC_SMOOTHCALIB_PLUSPULSES_SET: Add one RTCCLK pulse every 2*11 pulses.
  - RTC_SMOOTHCALIB_PLUSPULSES_RESET: No RTCCLK pulses are added.
- **SmoothCalibMinusPulsesValue:** Select the value of CALM[8:0] bits. This parameter can be one any value from 0 to 0x000001FF.

Return values

- **HAL:** status

Notes

- To deactivate the smooth calibration, the field SmoothCalibPlusPulses must be equal to SMOOTHCALIB_PLUSPULSES_RESET and the field SmoothCalibMinusPulsesValue must be equal to 0.

HAL_RTCEx_SetLowPowerCalib

Function name

HAL_StatusTypeDef HAL_RTCEx_SetLowPowerCalib (RTC_HandleTypeDef * hrtc, uint32_t LowPowerCalib)

Function description

Select the low power Calibration mode.

Parameters

- **hrtc:** RTC handle
- **LowPowerCalib:** Low power Calibration mode. This parameter can be one of the following values :
  - RTC_LPCAL_SET: Low power mode.
  - RTC_LPCAL_RESET: High consumption mode.

Return values

- **HAL:** status

HAL_RTCEx_SetSynchroShift

Function name

HAL_StatusTypeDef HAL_RTCEx_SetSynchroShift (RTC_HandleTypeDef * hrtc, uint32_t ShiftAdd1S, uint32_t ShiftSubFS)

Function description

Configure the Synchronization Shift Control Settings.

Parameters

- **hrtc:** RTC handle
- **ShiftAdd1S:** Select to add or not 1 second to the time calendar. This parameter can be one of the following values:
  - RTC_SHIFTADD1S_SET: Add one second to the clock calendar.
  - RTC_SHIFTADD1S_RESET: No effect.
- **ShiftSubFS:** Select the number of Second Fractions to substitute. This parameter can be one any value from 0 to 0x7FFF.

Return values

- **HAL:** status

Notes

- When REFCKON is set, firmware must not write to Shift control register.

HAL_RTCEx_SetCalibrationOutPut

Function name

HAL_StatusTypeDef HAL_RTCEx_SetCalibrationOutPut (RTC_HandleTypeDef * hrtc, uint32_t CalibOutput)

Function description

Configure the Calibration Pinout (RTC_CALIB) Selection (1Hz or 512Hz).

Parameters

- **hrtc:** RTC handle
- **CalibOutput:** Select the Calibration output Selection . This parameter can be one of the following values:
  - RTC_CALIBOUTPUT_512HZ: A signal has a regular waveform at 512Hz.
  - RTC_CALIBOUTPUT_1HZ: A signal has a regular waveform at 1Hz.

Return values

- **HAL:** status

HAL_RTCEx_DeactivateCalibrationOutPut

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateCalibrationOutPut (RTC_HandleTypeDef * hrtc)

Function description

Deactivate the Calibration Pinout (RTC_CALIB) Selection (1Hz or 512Hz).

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_SetRefClock

Function name

HAL_StatusTypeDef HAL_RTCEx_SetRefClock (RTC_HandleTypeDef * hrtc)

Function description

Enable the RTC reference clock detection.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_DeactivateRefClock

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateRefClock (RTC_HandleTypeDef * hrtc)

Function description

Disable the RTC reference clock detection.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_EnableBypassShadow

Function name

HAL_StatusTypeDef HAL_RTCEx_EnableBypassShadow (RTC_HandleTypeDef * hrtc)

Function description

Enable the Bypass Shadow feature.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- When the Bypass Shadow is enabled the calendar value are taken directly from the Calendar counter.

HAL_RTCEx_DisableBypassShadow

Function name

HAL_StatusTypeDef HAL_RTCEx_DisableBypassShadow (RTC_HandleTypeDef * hrtc)

Function description

Disable the Bypass Shadow feature.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- When the Bypass Shadow is enabled the calendar value are taken directly from the Calendar counter.

HAL_RTCEx_MonotonicCounterIncrement

Function name

HAL_StatusTypeDef HAL_RTCEx_MonotonicCounterIncrement (const RTC_HandleTypeDef * hrtc, uint32_t Instance)

Function description

Increment Monotonic counter.

Parameters

- **hrtc:** RTC handle
- **Instance:** Monotonic counter Instance This parameter can be one of the following values :
  - RTC_MONOTONIC_COUNTER_1

Return values

- **HAL:** status

HAL_RTCEx_MonotonicCounterGet

Function name

HAL_StatusTypeDef HAL_RTCEx_MonotonicCounterGet (const RTC_HandleTypeDef * hrtc, uint32_t Instance, uint32_t * pValue)

Function description

Monotonic counter.

Parameters

- **hrtc:** RTC handle
- **Instance:** Monotonic counter Instance This parameter can be one of the following values :
  - RTC_MONOTONIC_COUNTER_1
- **pValue:** Pointer to the counter monotonic counter value

Return values

- **HAL:** status

HAL_RTCEx_SetSSRU_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetSSRU_IT (RTC_HandleTypeDef * hrtc)

Function description

Set SSR Underflow detection with Interrupt.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- The application must ensure that the EXTI RTC interrupt line is enabled.

HAL_RTCEx_DeactivateSSRU

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateSSRU (RTC_HandleTypeDef * hrtc)

Function description

Deactivate SSR Underflow.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_SSRUIRQHandler

Function name

void HAL_RTCEx_SSRUIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

Handle SSR underflow interrupt request.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_SSRUEventCallback

Function name

void HAL_RTCEx_SSRUEventCallback (RTC_HandleTypeDef * hrtc)

Function description

SSR underflow callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_AlarmBEventCallback

Function name

void HAL_RTCEx_AlarmBEventCallback (RTC_HandleTypeDef * hrtc)

Function description

Alarm B callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_PollForAlarmBEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForAlarmBEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

Handle Alarm B Polling request.

Parameters

- **hrtc:** RTC handle
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_RTCEx_SetTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTamper (const RTC_HandleTypeDef * hrtc, const RTC_TamperTypeDef * sTamper)

Function description

Set Tamper.

Parameters

- **hrtc:** RTC handle
- **sTamper:** Pointer to Tamper Structure.

Return values

- **HAL:** status

HAL_RTCEx_SetActiveTampers

Function name

HAL_StatusTypeDef HAL_RTCEx_SetActiveTampers (RTC_HandleTypeDef * hrtc, const RTC_ActiveTampersTypeDef * sAllTamper)

Function description

Set all active Tampers at the same time.

Parameters

- **hrtc:** RTC handle
- **sAllTamper:** Pointer to active Tamper Structure.

Return values

- **HAL:** status

Notes

- For interrupt mode, the application must ensure that the EXTI TAMP interrupt line is enabled.

HAL_RTCEx_SetActiveSeed

Function name

HAL_StatusTypeDef HAL_RTCEx_SetActiveSeed (RTC_HandleTypeDef * hrtc, const uint32_t * pSeed)

Function description

Write a new seed.

Parameters

- **hrtc:** RTC handle
- **pSeed:** Pointer to active tamper seed values.

Return values

- **HAL:** status

HAL_RTCEx_SetTamper_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTamper_IT (const RTC_HandleTypeDef * hrtc, const RTC_TamperTypeDef * sTamper)

Function description

Set Tamper in IT mode.

Parameters

- **hrtc:** RTC handle
- **sTamper:** Pointer to Tamper Structure.

Return values

- **HAL:** status

Notes

- The application must ensure that the EXTI TAMP interrupt line is enabled.

HAL_RTCEx_DeactivateTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateTamper (const RTC_HandleTypeDef * hrtc, uint32_t Tamper)

Function description

Deactivate Tamper.

Parameters

- **hrtc:** RTC handle
- **Tamper:** Selected tamper pin. This parameter can be a combination of the following values:
  - RTC_TAMPER_1
  - RTC_TAMPER_2
  - RTC_TAMPER_3
  - RTC_TAMPER_4
  - RTC_TAMPER_5
  - RTC_TAMPER_6
  - RTC_TAMPER_7
  - RTC_TAMPER_8

Return values

- **HAL:** status

HAL_RTCEx_DeactivateActiveTampers

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateActiveTampers (const RTC_HandleTypeDef * hrtc)

Function description

Deactivate all Active Tampers at the same time.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

HAL_RTCEx_PollForTamperEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForTamperEvent (const RTC_HandleTypeDef * hrtc, uint32_t Tamper, uint32_t Timeout)

Function description

Tamper event polling.

Parameters

- **hrtc:** RTC handle
- **Tamper:** Selected tamper pin. This parameter can be a combination of the following values:
  - RTC_TAMPER_1
  - RTC_TAMPER_2
  - RTC_TAMPER_3
  - RTC_TAMPER_4
  - RTC_TAMPER_5
  - RTC_TAMPER_6
  - RTC_TAMPER_7
  - RTC_TAMPER_8
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_RTCEx_SetInternalTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_SetInternalTamper (const RTC_HandleTypeDef * hrtc, const RTC_InternalTamperTypeDef * sIntTamper)

Function description

Set Internal Tamper.

Parameters

- **hrtc:** RTC handle
- **sIntTamper:** Pointer to Internal Tamper Structure.

Return values

- **HAL:** status

HAL_RTCEx_SetInternalTamper_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetInternalTamper_IT (const RTC_HandleTypeDef * hrtc, const RTC_InternalTamperTypeDef * sIntTamper)

Function description

Set Internal Tamper in interrupt mode.

Parameters

- **hrtc:** RTC handle
- **sIntTamper:** Pointer to Internal Tamper Structure.

Return values

- **HAL:** status

Notes

- The application must ensure that the EXTI TAMP interrupt line is enabled.

HAL_RTCEx_DeactivateInternalTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateInternalTamper (const RTC_HandleTypeDef * hrtc, uint32_t IntTamper)

Function description

Deactivate Internal Tamper.

Parameters

- **hrtc:** RTC handle
- **IntTamper:** Selected internal tamper event. This parameter can be any combination of existing internal tampers.

Return values

- **HAL:** status

HAL_RTCEx_PollForInternalTamperEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForInternalTamperEvent (const RTC_HandleTypeDef * hrtc, uint32_t IntTamper, uint32_t Timeout)

Function description

Internal Tamper event polling.

Parameters

- **hrtc:** RTC handle
- **IntTamper:** selected tamper. This parameter can be any combination of existing internal tampers.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_RTCEx_LockBootHardwareKey

Function name

HAL_StatusTypeDef HAL_RTCEx_LockBootHardwareKey (const RTC_HandleTypeDef * hrtc)

Function description

Lock the Boot hardware Key.

Parameters

- **hrtc:** RTC handle

Return values

- **HAL:** status

Notes

- The backup registers from TAMP_BKP0R to TAMP_BKP7R cannot be accessed neither in read nor in write (they are read as 0 and write ignore).

HAL_RTCEx_TamperIRQHandler

Function name

void HAL_RTCEx_TamperIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

Handle Tamper interrupt request.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper1EventCallback

Function name

void HAL_RTCEx_Tamper1EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 1 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper2EventCallback

Function name

void HAL_RTCEx_Tamper2EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 2 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper3EventCallback

Function name

void HAL_RTCEx_Tamper3EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 3 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper4EventCallback

Function name

void HAL_RTCEx_Tamper4EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 4 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper5EventCallback

Function name

void HAL_RTCEx_Tamper5EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 5 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper6EventCallback

Function name

void HAL_RTCEx_Tamper6EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 6 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper7EventCallback

Function name

void HAL_RTCEx_Tamper7EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 7 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_Tamper8EventCallback

Function name

void HAL_RTCEx_Tamper8EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Tamper 8 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper1EventCallback

Function name

void HAL_RTCEx_InternalTamper1EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 1 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper2EventCallback

Function name

void HAL_RTCEx_InternalTamper2EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 2 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper3EventCallback

Function name

void HAL_RTCEx_InternalTamper3EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 3 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper4EventCallback

Function name

void HAL_RTCEx_InternalTamper4EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 4 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper5EventCallback

Function name

void HAL_RTCEx_InternalTamper5EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 5 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper6EventCallback

Function name

void HAL_RTCEx_InternalTamper6EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 6 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper7EventCallback

Function name

void HAL_RTCEx_InternalTamper7EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 7 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper8EventCallback

Function name

void HAL_RTCEx_InternalTamper8EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 8 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper9EventCallback

Function name

void HAL_RTCEx_InternalTamper9EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 9 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper11EventCallback

Function name

void HAL_RTCEx_InternalTamper11EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 11 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper12EventCallback

Function name

void HAL_RTCEx_InternalTamper12EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 12 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper13EventCallback

Function name

void HAL_RTCEx_InternalTamper13EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 13 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_InternalTamper15EventCallback

Function name

void HAL_RTCEx_InternalTamper15EventCallback (RTC_HandleTypeDef * hrtc)

Function description

Internal Tamper 15 callback.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_BKUPWrite

Function name

void HAL_RTCEx_BKUPWrite (const RTC_HandleTypeDef * hrtc, uint32_t BackupRegister, uint32_t Data)

Function description

Write a data in a specified RTC Backup data register.

Parameters

- **hrtc:** RTC handle
- **BackupRegister:** RTC Backup data Register number. This parameter can be RTC_BKP_DRx where x can be from 0 to RTC_BACKUP_NB
- **Data:** Data to be written in the specified Backup data register.

Return values

- **None:**

HAL_RTCEx_BKUPRead

Function name

uint32_t HAL_RTCEx_BKUPRead (const RTC_HandleTypeDef * hrtc, uint32_t BackupRegister)

Function description

Reads data from the specified RTC Backup data Register.

Parameters

- **hrtc:** RTC handle
- **BackupRegister:** RTC Backup data Register number. This parameter can be RTC_BKP_DRx where x can be from 0 to RTC_BACKUP_NB

Return values

- **Read:** value

HAL_RTCEx_BKUPErase

Function name

void HAL_RTCEx_BKUPErase (const RTC_HandleTypeDef * hrtc)

Function description

Reset the RTC Backup data Registers and the device secrets.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_BKUPBlock

Function name

void HAL_RTCEx_BKUPBlock (const RTC_HandleTypeDef * hrtc)

Function description

Block the access to the RTC Backup data Register and all the device secrets.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_BKUPUnblock

Function name

void HAL_RTCEx_BKUPUnblock (const RTC_HandleTypeDef * hrtc)

Function description

Disable the Block to the access to the RTC Backup data Register and the device secrets.

Parameters

- **hrtc:** RTC handle

Return values

- **None:**

HAL_RTCEx_ConfigEraseDeviceSecrets

Function name

void HAL_RTCEx_ConfigEraseDeviceSecrets (const RTC_HandleTypeDef * hrtc, uint32_t DeviceSecretConf)

Function description

Enable and Disable the erase of the configurable Device Secrets.

Parameters

- **hrtc:** RTC handle
- **DeviceSecretConf:** Specifies the configuration of the Device Secrets This parameter can be a combination of the following values:
  - TAMP_DEVICESECRETS_ERASE_NONE
  - TAMP_DEVICESECRETS_ERASE_BKPSRAM

Return values

- **None:**

Notes

- This API must be called before enabling the Tamper.

HAL_RTCEx_SecureModeGet

Function name

HAL_StatusTypeDef HAL_RTCEx_SecureModeGet (const RTC_HandleTypeDef * hrtc, RTC_SecureStateTypeDef * secureState)

Function description

Get the security level of the RTC/TAMP/Backup registers.

Parameters

- **hrtc:** RTC handle
- **secureState:** Secure state

Return values

- **HAL_StatusTypeDef:**

HAL_RTCEx_SecureModeSet

Function name

HAL_StatusTypeDef HAL_RTCEx_SecureModeSet (const RTC_HandleTypeDef * hrtc, const RTC_SecureStateTypeDef * secureState)

Function description

Set the security level of the RTC/TAMP/Backup registers.

Parameters

- **hrtc:** RTC handle
- **secureState:** Secure state

Return values

- **HAL_StatusTypeDef:**

HAL_RTCEx_PrivilegeModeSet

Function name

HAL_StatusTypeDef HAL_RTCEx_PrivilegeModeSet (const RTC_HandleTypeDef * hrtc, const RTC_PrivilegeStateTypeDef * privilegeState)

Function description

Set the privilege level of the RTC/TAMP/Backup registers.

Parameters

- **hrtc:** RTC handle
- **privilegeState:** Privilege state

Return values

- **HAL_StatusTypeDef:**

HAL_RTCEx_PrivilegeModeGet

Function name

HAL_StatusTypeDef HAL_RTCEx_PrivilegeModeGet (const RTC_HandleTypeDef * hrtc, RTC_PrivilegeStateTypeDef * privilegeState)

Function description

Get the privilege level of the RTC/TAMP/Backup registers.

Parameters

- **hrtc:** RTC handle
- **privilegeState:** Privilege state

Return values

- **HAL_StatusTypeDef:**

RTC_SHIFTADD1S_RESET

RTC_SHIFTADD1S_SET

RTC Alarm Sub Seconds

RTC_ALARMSUBSECONDBIN_AUTOCLR_NO

The synchronous Binary counter(SS[31:0] in RTC_SSR) is free-running

RTC_ALARMSUBSECONDBIN_AUTOCLR_YES

The synchronous Binary counter (SS[31:0] in RTC_SSR) is running from 0xFFFF FFFF to RTC_ALRMABINR -> SS[31:0] value and is automatically reloaded with 0xFFFF FFFF whenreaching RTC_ALRMABINR -> SS[31:0].

RTC Alarm Sub Seconds with binary or mix mode

RTC_ALARMSUBSECONDBINMASK_ALL

All Alarm SS fields are masked.There is no comparison on sub seconds for Alarm

RTC_ALARMSUBSECONDBINMASK_SS31_1

SS[31:1] are don't care in Alarm comparison. Only SS[0] is compared

RTC_ALARMSUBSECONDBINMASK_SS31_2

SS[31:2] are don't care in Alarm comparison. Only SS[1:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_3

SS[31:3] are don't care in Alarm comparison. Only SS[2:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_4

SS[31:4] are don't care in Alarm comparison. Only SS[3:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_5

SS[31:5] are don't care in Alarm comparison. Only SS[4:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_6

SS[31:6] are don't care in Alarm comparison. Only SS[5:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_7

SS[31:7] are don't care in Alarm comparison. Only SS[6:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_8

SS[31:8] are don't care in Alarm comparison. Only SS[7:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_9

SS[31:9] are don't care in Alarm comparison. Only SS[8:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_10

SS[31:10] are don't care in Alarm comparison. Only SS[9:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_11

SS[31:11] are don't care in Alarm comparison. Only SS[10:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_12

SS[31:12] are don't care in Alarm comparison.Only SS[11:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_13

SS[31:13] are don't care in Alarm comparison. Only SS[12:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_14

SS[31:14] are don't care in Alarm comparison. Only SS[13:0] are compared

If Binary mode is RTC_BINARY_MIX, the BCD calendar second is incremented

RTC_BINARY_MIX_BCDU_0

The 1s BCD calendar increment is generated each time SS[7:0] = 0

RTC_BINARY_MIX_BCDU_1

The 1s BCD calendar increment is generated each time SS[8:0] = 0

RTC_BINARY_MIX_BCDU_2

The 1s BCD calendar increment is generated each time SS[9:0] = 0

RTC_BINARY_MIX_BCDU_3

The 1s BCD calendar increment is generated each time SS[10:0] = 0

RTC_BINARY_MIX_BCDU_4

The 1s BCD calendar increment is generated each time SS[11:0] = 0

RTC_BINARY_MIX_BCDU_5

The 1s BCD calendar increment is generated each time SS[12:0] = 0

RTC_BINARY_MIX_BCDU_6

The 1s BCD calendar increment is generated each time SS[13:0] = 0

RTC_BINARY_MIX_BCDU_7

The 1s BCD calendar increment is generated each time SS[14:0] = 0

RTC Binary Mode (32-bit free-running counter configuration).

RTC_BINARY_NONE

Free running BCD calendar mode (Binary mode disabled)

RTC_BINARY_ONLY

Free running Binary mode (BCD mode disabled)

RTC_BINARY_MIX

Free running BCD calendar and Binary modes

RTC Calibration

__HAL_RTC_CALIBRATION_OUTPUT_ENABLE

Description:

- Enable the RTC calibration output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_CALIBRATION_OUTPUT_DISABLE

Description:

- Disable the calibration output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_CLOCKREF_DETECTION_ENABLE

Description:

- Enable the clock reference detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_CLOCKREF_DETECTION_DISABLE

Description:

- Disable the clock reference detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_SHIFT_GET_FLAG

Description:

- Get the selected RTC shift operations flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC shift operation Flag is pending or not. This parameter can be:
  - RTC_FLAG_SHPF

Return value:

- None

RTCEx Calib Output selection Definitions

RTC_CALIBOUTPUT_512HZ

RTC_CALIBOUTPUT_1HZ

RTCEx Exported Macros

__HAL_RTC_CLEAR_FLAG

Description:

- Clear the specified RTC pending flag.

Parameters:

- __HANDLE__: specifies the RTC Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - RTC_CLEAR_ITSF Clear Internal Time-stamp flag
  - RTC_CLEAR_TSOVF Clear Time-stamp overflow flag
  - RTC_CLEAR_TSF Clear Time-stamp flag
  - RTC_CLEAR_WUTF Clear Wakeup timer flag
  - RTC_CLEAR_ALRBF Clear Alarm B flag
  - RTC_CLEAR_ALRAF Clear Alarm A flag

Return value:

- None

__HAL_RTC_GET_FLAG

Description:

- Check whether the specified RTC flag is set or not.

Parameters:

- __HANDLE__: specifies the RTC Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - RTC_FLAG_RECALPF Recalibration pending Flag
  - RTC_FLAG_INITF Initialization flag
  - RTC_FLAG_RSF Registers synchronization flag
  - RTC_FLAG_INITS Initialization status flag
  - RTC_FLAG_SHPF Shift operation pending flag
  - RTC_FLAG_WUTWF Wakeup timer write flag
  - RTC_FLAG_ITSF Internal Time-stamp flag
  - RTC_FLAG_TSOVF Time-stamp overflow flag
  - RTC_FLAG_TSF Time-stamp flag
  - RTC_FLAG_WUTF Wakeup timer flag
  - RTC_FLAG_ALRBF Alarm B flag
  - RTC_FLAG_ALRAF Alarm A flag

Return value:

- None

RTCEx Smooth calib Low Power Definitions

RTC_LPCAL_SET

Calibration window is 2exp20 ck_apre, which is the required configuration for ultra-low consumption mode.

RTC_LPCAL_RESET

Calibration window is 2exp20 RTCCLK, which is a high-consumption mode. This mode should be set only when less than 32s calibration window is required.

RTCEx Smooth calib period Definitions

RTC_SMOOTHCALIB_PERIOD_32SEC

If RTCCLK = 32768 Hz, Smooth calibration period is 32s, else 2exp20 RTCCLK pulses

RTC_SMOOTHCALIB_PERIOD_16SEC

If RTCCLK = 32768 Hz, Smooth calibration period is 16s, else 2exp19 RTCCLK pulses

RTC_SMOOTHCALIB_PERIOD_8SEC

If RTCCLK = 32768 Hz, Smooth calibration period is 8s, else 2exp18 RTCCLK pulses

RTCEx Smooth calib Plus pulses Definitions

RTC_SMOOTHCALIB_PLUSPULSES_SET

The number of RTCCLK pulses added during a X -second window = Y - CALM[8:0] with Y = 512, 256, 128 when X = 32, 16, 8

RTC_SMOOTHCALIB_PLUSPULSES_RESET

The number of RTCCLK pulses subbstited during a 32-second window = CALM[8:0]

RTC SSR Underflow

__HAL_RTC_SSRU_ENABLE_IT

Description:

- Enable the RTC SSRU interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt sources to be enabled. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- None

__HAL_RTC_SSRU_DISABLE_IT

Description:

- Disable the RTC SSRU interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt sources to be disabled. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- None

__HAL_RTC_SSRU_GET_IT

Description:

- Check whether the specified RTC SSRU interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt to check. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- None

__HAL_RTC_SSRU_GET_IT_SOURCE

Description:

- Check whether the specified RTC Wake Up timer interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Wake Up timer interrupt sources to check. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- None

__HAL_RTC_SSRU_GET_FLAG

Description:

- Get the selected RTC SSRU's flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC SSRU Flag is pending or not. This parameter can be:
  - RTC_FLAG_SSRUF

Return value:

- None

__HAL_RTC_SSRU_CLEAR_FLAG

Description:

- Clear the RTC Wake Up timer's pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC SSRU Flag to clear. This parameter can be:
  - RTC_FLAG_SSRUF

Return value:

- None

RTCEx tamper

__HAL_RTC_TAMPER_ENABLE

Description:

- Enable the TAMP Tamper input detection.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __TAMPER__: specifies the RTC Tamper source to be enabled. This parameter can be any combination of the following values:
  - RTC_TAMPER_ALL: All tampers
  - RTC_TAMPER_1: Tamper1
  - RTC_TAMPER_2: Tamper2
  - RTC_TAMPER_3: Tamper3
  - RTC_TAMPER_4: Tamper4
  - RTC_TAMPER_5: Tamper5
  - RTC_TAMPER_6: Tamper6
  - RTC_TAMPER_7: Tamper7
  - RTC_TAMPER_8: Tamper8

Return value:

- None

__HAL_RTC_TAMPER_DISABLE

Description:

- Disable the TAMP Tamper input detection.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __TAMPER__: specifies the RTC Tamper sources to be enabled. This parameter can be any combination of the following values:
  - RTC_TAMPER_ALL: All tampers
  - RTC_TAMPER_1: Tamper1
  - RTC_TAMPER_2: Tamper2
  - RTC_TAMPER_3: Tamper3
  - RTC_TAMPER_4: Tamper4
  - RTC_TAMPER_5: Tamper5
  - RTC_TAMPER_6: Tamper6
  - RTC_TAMPER_7: Tamper7
  - RTC_TAMPER_8: Tamper8

__HAL_RTC_TAMPER_ENABLE_IT

Description:

- Enable the TAMP Tamper interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt sources to be enabled. This parameter can be any combination of the following values:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt

Return value:

- None

__HAL_RTC_TAMPER_DISABLE_IT

Description:

- Disable the TAMP Tamper interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt sources to be disabled. This parameter can be any combination of the following values:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt

Return value:

- None

__HAL_RTC_TAMPER_GET_IT

Description:

- Check whether the specified RTC Tamper interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt to check. This parameter can be:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt
  - RTC_IT_INT_TAMP_ALL: All Internal Tamper interrupts
  - RTC_IT_INT_TAMP_1: Internal Tamper1 interrupt
  - RTC_IT_INT_TAMP_2: Internal Tamper2 interrupt
  - RTC_IT_INT_TAMP_3: Internal Tamper3 interrupt
  - RTC_IT_INT_TAMP_4: Internal Tamper4 interrupt
  - RTC_IT_INT_TAMP_5: Internal Tamper5 interrupt
  - RTC_IT_INT_TAMP_6: Internal Tamper6 interrupt
  - RTC_IT_INT_TAMP_7: Internal Tamper7 interrupt
  - RTC_IT_INT_TAMP_8: Internal Tamper8 interrupt
  - RTC_IT_INT_TAMP_9: Internal Tamper9 interrupt
  - RTC_IT_INT_TAMP_11: Internal Tamper11 interrupt
  - RTC_IT_INT_TAMP_12: Internal Tamper12 interrupt
  - RTC_IT_INT_TAMP_13: Internal Tamper13 interrupt
  - RTC_IT_INT_TAMP_15: Internal Tamper15 interrupt

Return value:

- None

__HAL_RTC_TAMPER_GET_IT_SOURCE

Description:

- Check whether the specified RTC Tamper interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt source to check. This parameter can be:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt
  - RTC_IT_INT_TAMP_ALL: All internal tampers interrupts
  - RTC_IT_INT_TAMP_1: Internal Tamper1 interrupt
  - RTC_IT_INT_TAMP_2: Internal Tamper2 interrupt
  - RTC_IT_INT_TAMP_3: Internal Tamper3 interrupt
  - RTC_IT_INT_TAMP_4: Internal Tamper4 interrupt
  - RTC_IT_INT_TAMP_5: Internal Tamper5 interrupt
  - RTC_IT_INT_TAMP_6: Internal Tamper6 interrupt
  - RTC_IT_INT_TAMP_7: Internal Tamper7 interrupt
  - RTC_IT_INT_TAMP_8: Internal Tamper8 interrupt
  - RTC_IT_INT_TAMP_9: Internal Tamper9 interrupt
  - RTC_IT_INT_TAMP_11: Internal Tamper11 interrupt
  - RTC_IT_INT_TAMP_12: Internal Tamper12 interrupt
  - RTC_IT_INT_TAMP_13: Internal Tamper13 interrupt
  - RTC_IT_INT_TAMP_15: Internal Tamper15 interrupt

Return value:

- None

__HAL_RTC_TAMPER_GET_FLAG

Description:

- Get the selected RTC Tampers flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Tamper Flag is pending or not. This parameter can be:
  - RTC_FLAG_TAMP_ALL: All tampers flag
  - RTC_FLAG_TAMP_1: Tamper1 flag
  - RTC_FLAG_TAMP_2: Tamper2 flag
  - RTC_FLAG_TAMP_3: Tamper3 flag
  - RTC_FLAG_TAMP_4: Tamper4 flag
  - RTC_FLAG_TAMP_5: Tamper5 flag
  - RTC_FLAG_TAMP_6: Tamper6 flag
  - RTC_FLAG_TAMP_7: Tamper7 flag
  - RTC_FLAG_TAMP_8: Tamper8 flag
  - RTC_FLAG_INT_TAMP_1: Internal Tamper1 flag
  - RTC_FLAG_INT_TAMP_2: Internal Tamper2 flag
  - RTC_FLAG_INT_TAMP_3: Internal Tamper3 flag
  - RTC_FLAG_INT_TAMP_4: Internal Tamper4 flag
  - RTC_FLAG_INT_TAMP_5: Internal Tamper5 flag
  - RTC_FLAG_INT_TAMP_6: Internal Tamper6 flag
  - RTC_FLAG_INT_TAMP_7: Internal Tamper7 flag
  - RTC_FLAG_INT_TAMP_8: Internal Tamper8 flag
  - RTC_FLAG_INT_TAMP_9: Internal Tamper9 flag
  - RTC_FLAG_INT_TAMP_11: Internal Tamper11 flag
  - RTC_FLAG_INT_TAMP_12: Internal Tamper12 flag
  - RTC_FLAG_INT_TAMP_13: Internal Tamper13 flag
  - RTC_FLAG_INT_TAMP_15: Internal Tamper15 flag

Return value:

- None

__HAL_RTC_TAMPER_CLEAR_FLAG

Description:

- Clear the RTC Tamper's pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Tamper Flag to clear. This parameter can be:
  - RTC_FLAG_TAMP_ALL: All tampers flag
  - RTC_FLAG_TAMP_1: Tamper1 flag
  - RTC_FLAG_TAMP_2: Tamper2 flag
  - RTC_FLAG_TAMP_3: Tamper3 flag
  - RTC_FLAG_TAMP_4: Tamper4 flag
  - RTC_FLAG_TAMP_5: Tamper5 flag
  - RTC_FLAG_TAMP_6: Tamper6 flag
  - RTC_FLAG_TAMP_7: Tamper7 flag
  - RTC_FLAG_TAMP_8: Tamper8 flag
  - RTC_FLAG_INT_TAMP_ALL: All Internal Tamper flags
  - RTC_FLAG_INT_TAMP_1: Internal Tamper1 flag
  - RTC_FLAG_INT_TAMP_2: Internal Tamper2 flag
  - RTC_FLAG_INT_TAMP_3: Internal Tamper3 flag
  - RTC_FLAG_INT_TAMP_4: Internal Tamper4 flag
  - RTC_FLAG_INT_TAMP_5: Internal Tamper5 flag
  - RTC_FLAG_INT_TAMP_6: Internal Tamper6 flag
  - RTC_FLAG_INT_TAMP_7: Internal Tamper7 flag
  - RTC_FLAG_INT_TAMP_8: Internal Tamper8 flag
  - RTC_FLAG_INT_TAMP_9: Internal Tamper9 flag
  - RTC_FLAG_INT_TAMP_11: Internal Tamper11 flag
  - RTC_FLAG_INT_TAMP_12: Internal Tamper12 flag
  - RTC_FLAG_INT_TAMP_13: Internal Tamper13 flag
  - RTC_FLAG_INT_TAMP_15: Internal Tamper15 flag

Return value:

- None

RTC Timestamp

__HAL_RTC_TIMESTAMP_ENABLE

Description:

- Enable the RTC TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TIMESTAMP_DISABLE

Description:

- Disable the RTC TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TIMESTAMP_ENABLE_IT

Description:

- Enable the RTC TimeStamp interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC TimeStamp interrupt source to be enabled. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- None

__HAL_RTC_TIMESTAMP_DISABLE_IT

Description:

- Disable the RTC TimeStamp interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC TimeStamp interrupt source to be disabled. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- None

__HAL_RTC_TIMESTAMP_GET_IT

Description:

- Check whether the specified RTC TimeStamp interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC TimeStamp interrupt to check. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- None

__HAL_RTC_TIMESTAMP_GET_IT_SOURCE

Description:

- Check whether the specified RTC Time Stamp interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Time Stamp interrupt source to check. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- None

__HAL_RTC_TIMESTAMP_GET_FLAG

Description:

- Get the selected RTC TimeStamps flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC TimeStamp Flag is pending or not. This parameter can be:
  - RTC_FLAG_TSF
  - RTC_FLAG_TSOVF

Return value:

- None

__HAL_RTC_TIMESTAMP_CLEAR_FLAG

Description:

- Clear the RTC Time Stamps pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC TimeStamp Flag to clear. This parameter can be:
  - RTC_FLAG_TSF
  - RTC_FLAG_TSOVF

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_ENABLE

Description:

- Enable the RTC internal TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_DISABLE

Description:

- Disable the RTC internal TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_GET_FLAG

Description:

- Get the selected RTC Internal Time Stamps flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Internal Time Stamp Flag is pending or not. This parameter can be:
  - RTC_FLAG_ITSF

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_CLEAR_FLAG

Description:

- Clear the RTC Internal Time Stamps pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Internal Time Stamp Flag source to clear. This parameter can be:
  - RTC_FLAG_ITSF

Return value:

- None

__HAL_RTC_TAMPTS_ENABLE

Description:

- Enable the RTC TimeStamp on Tamper detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TAMPTS_DISABLE

Description:

- Disable the RTC TimeStamp on Tamper detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TAMPOE_ENABLE

Description:

- Enable the RTC Tamper detection output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TAMPOE_DISABLE

Description:

- Disable the RTC Tamper detection output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

RTC WakeUp Timer

__HAL_RTC_WAKEUPTIMER_ENABLE

Description:

- Enable the RTC WakeUp Timer peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_WAKEUPTIMER_DISABLE

Description:

- Disable the RTC WakeUp Timer peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_WAKEUPTIMER_ENABLE_IT

Description:

- Enable the RTC WakeUpTimer interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC WakeUpTimer interrupt sources to be enabled. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- None

__HAL_RTC_WAKEUPTIMER_DISABLE_IT

Description:

- Disable the RTC WakeUpTimer interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC WakeUpTimer interrupt sources to be disabled. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- None

__HAL_RTC_WAKEUPTIMER_GET_IT

Description:

- Check whether the specified RTC WakeUpTimer interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC WakeUpTimer interrupt to check. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- None

__HAL_RTC_WAKEUPTIMER_GET_IT_SOURCE

Description:

- Check whether the specified RTC Wake Up timer interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Wake Up timer interrupt sources to check. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- None

__HAL_RTC_WAKEUPTIMER_GET_FLAG

Description:

- Get the selected RTC WakeUpTimers flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC WakeUpTimer Flag is pending or not. This parameter can be:
  - RTC_FLAG_WUTF
  - RTC_FLAG_WUTWF

Return value:

- None

__HAL_RTC_WAKEUPTIMER_CLEAR_FLAG

Description:

- Clear the RTC Wake Up timers pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC WakeUpTimer Flag to clear. This parameter can be:
  - RTC_FLAG_WUTF

Return value:

- None

65 HAL SAI Generic Driver

65.1 SAI Firmware driver registers structures

65.1.1 SAI_PdmInitTypeDef

SAI_PdmInitTypeDef is defined in the stm32h5xx_hal_sai.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t MicPairsNbr***
- ***uint32_t ClockEnable***

Field Documentation

- ***FunctionalState SAI_PdmInitTypeDef::Activation***
  Enable/disable PDM interface
- ***uint32_t SAI_PdmInitTypeDef::MicPairsNbr***
  Specifies the number of microphone pairs used. This parameter must be a number between Min_Data = 1 and Max_Data = 3.
- ***uint32_t SAI_PdmInitTypeDef::ClockEnable***
  Specifies which clock must be enabled. This parameter can be a values combination of ***SAI_PDM_ClockEnable***

65.1.2 SAI_InitTypeDef

SAI_InitTypeDef is defined in the stm32h5xx_hal_sai.h

Data Fields

- ***uint32_t AudioMode***
- ***uint32_t Synchro***
- ***uint32_t SynchroExt***
- ***uint32_t MckOutput***
- ***uint32_t OutputDrive***
- ***uint32_t NoDivider***
- ***uint32_t FIFOThreshold***
- ***uint32_t AudioFrequency***
- ***uint32_t Mckdiv***
- ***uint32_t MckOverSampling***
- ***uint32_t MonoStereoMode***
- ***uint32_t CompandingMode***
- ***uint32_t TriState***
- ***SAI_PdmInitTypeDef PdmInit***
- ***uint32_t Protocol***
- ***uint32_t DataSize***
- ***uint32_t FirstBit***
- ***uint32_t ClockStrobing***

Field Documentation

- ***uint32_t SAI_InitTypeDef::AudioMode***
  Specifies the SAI Block audio Mode. This parameter can be a value of ***SAI_Block_Mode***
- ***uint32_t SAI_InitTypeDef::Synchro***
  Specifies SAI Block synchronization This parameter can be a value of ***SAI_Block_Synchronization***

- ***uint32_t SAI_InitTypeDef::SynchroExt***
  Specifies SAI external output synchronization, this setup is common for BlockA and BlockB This parameter can be a value of ***SAI_Block_SyncExt***
  Note:
  – If both audio blocks of same SAI are used, this parameter has to be set to the same value for each audio block
- ***uint32_t SAI_InitTypeDef::MckOutput***
  Specifies whether master clock output will be generated or not. This parameter can be a value of ***SAI_Block_MckOutput***
- ***uint32_t SAI_InitTypeDef::OutputDrive***
  Specifies when SAI Block outputs are driven. This parameter can be a value of ***SAI_Block_Output_Drive***
  Note:
  – This value has to be set before enabling the audio block but after the audio block configuration.
- ***uint32_t SAI_InitTypeDef::NoDivider***
  Specifies whether master clock will be divided or not. This parameter can be a value of ***SAI_Block_NoDivider***
  Note:
  – If bit NODIV in the SAI_xCR1 register is cleared, the frame length should be aligned to a number equal to a power of 2, from 8 to 256. If bit NODIV in the SAI_xCR1 register is set, the frame length can take any of the values from 8 to 256.
- ***uint32_t SAI_InitTypeDef::FIFOThreshold***
  Specifies SAI Block FIFO threshold. This parameter can be a value of ***SAI_Block_Fifo_Threshold***
- ***uint32_t SAI_InitTypeDef::AudioFrequency***
  Specifies the audio frequency sampling. This parameter can be a value of ***SAI_Audio_Frequency***
- ***uint32_t SAI_InitTypeDef::Mckdiv***
  Specifies the master clock divider. This parameter must be a number between Min_Data = 0 and Max_Data = 63.
  Note:
  – This parameter is used only if AudioFrequency is set to SAI_AUDIO_FREQUENCY_MCKDIV otherwise it is internally computed.
- ***uint32_t SAI_InitTypeDef::MckOverSampling***
  Specifies the master clock oversampling. This parameter can be a value of ***SAI_Block_Mck_OverSampling***
- ***uint32_t SAI_InitTypeDef::MonoStereoMode***
  Specifies if the mono or stereo mode is selected. This parameter can be a value of ***SAI_Mono_Stereo_Mode***
- ***uint32_t SAI_InitTypeDef::CompandingMode***
  Specifies the companding mode type. This parameter can be a value of ***SAI_Block_Companding_Mode***
- ***uint32_t SAI_InitTypeDef::TriState***
  Specifies the companding mode type. This parameter can be a value of ***SAI_TRIState_Management***
- ***SAI_PdmInitTypeDef SAI_InitTypeDef::PdmInit***
  Specifies the PDM configuration.
- ***uint32_t SAI_InitTypeDef::Protocol***
  Specifies the SAI Block protocol. This parameter can be a value of ***SAI_Block_Protocol***
- ***uint32_t SAI_InitTypeDef::DataSize***
  Specifies the SAI Block data size. This parameter can be a value of ***SAI_Block_Data_Size***
- ***uint32_t SAI_InitTypeDef::FirstBit***
  Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of ***SAI_Block_MSB_LSB_transmission***
- ***uint32_t SAI_InitTypeDef::ClockStrobing***
  Specifies the SAI Block clock strobing edge sensitivity. This parameter can be a value of ***SAI_Block_Clock_Strobing***

65.1.3 SAI_FrameInitTypeDef

SAI_FrameInitTypeDef is defined in the stm32h5xx_hal_sai.h

Data Fields

- ***uint32_t FrameLength***
- ***uint32_t ActiveFrameLength***
- ***uint32_t FSDefinition***
- ***uint32_t FSPolarity***
- ***uint32_t FSOffset***

Field Documentation

- ***uint32_t SAI_FrameInitTypeDef::FrameLength***
  Specifies the Frame length, the number of SCK clocks for each audio frame. This parameter must be a number between Min_Data = 8 and Max_Data = 256.
  Note:
  – If master clock MCLK_x pin is declared as an output, the frame length should be aligned to a number equal to power of 2 in order to keep in an audio frame, an integer number of MCLK pulses by bit Clock.
- ***uint32_t SAI_FrameInitTypeDef::ActiveFrameLength***
  Specifies the Frame synchronization active level length. This Parameter specifies the length in number of bit clock (SCK + 1) of the active level of FS signal in audio frame. This parameter must be a number between Min_Data = 1 and Max_Data = 128
- ***uint32_t SAI_FrameInitTypeDef::FSDefinition***
  Specifies the Frame synchronization definition. This parameter can be a value of ***SAI_Block_FS_Definition***
- ***uint32_t SAI_FrameInitTypeDef::FSPolarity***
  Specifies the Frame synchronization Polarity. This parameter can be a value of ***SAI_Block_FS_Polarity***
- ***uint32_t SAI_FrameInitTypeDef::FSOffset***
  Specifies the Frame synchronization Offset. This parameter can be a value of ***SAI_Block_FS_Offset***

65.1.4 SAI_SlotInitTypeDef

SAI_SlotInitTypeDef is defined in the stm32h5xx_hal_sai.h

Data Fields

- ***uint32_t FirstBitOffset***
- ***uint32_t SlotSize***
- ***uint32_t SlotNumber***
- ***uint32_t SlotActive***

Field Documentation

- ***uint32_t SAI_SlotInitTypeDef::FirstBitOffset***
  Specifies the position of first data transfer bit in the slot. This parameter must be a number between Min_Data = 0 and Max_Data = 24
- ***uint32_t SAI_SlotInitTypeDef::SlotSize***
  Specifies the Slot Size. This parameter can be a value of ***SAI_Block_Slot_Size***
- ***uint32_t SAI_SlotInitTypeDef::SlotNumber***
  Specifies the number of slot in the audio frame. This parameter must be a number between Min_Data = 1 and Max_Data = 16
- ***uint32_t SAI_SlotInitTypeDef::SlotActive***
  Specifies the slots in audio frame that will be activated. This parameter can be a value of ***SAI_Block_Slot_Active***

65.1.5 __SAI_HandleTypeDef

__SAI_HandleTypeDef is defined in the stm32h5xx_hal_sai.h

Data Fields

- ***SAI_Block_TypeDef * Instance***
- ***SAI_InitTypeDef Init***
- ***SAI_FrameInitTypeDef FrameInit***
- ***SAI_SlotInitTypeDef SlotInit***
- ***uint8_t * pBuffPtr***
- ***uint16_t XferSize***

- *uint16_t XferCount*
- *DMA_HandleTypeDef * hdmatx*
- *DMA_HandleTypeDef * hdmarx*
- *SAIcallback mutecallback*

- ***void(* __SAI_HandleTypeDef::ErrorCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI error callback

- ***void(* __SAI_HandleTypeDef::MspInitCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI MSP init callback
- ***void(* __SAI_HandleTypeDef::MspDeInitCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI MSP de-init callback

65.2 SAI Firmware driver API description

The following section lists the various functions of the SAI library.

65.2.1 How to use this driver

The SAI HAL driver can be used as follows:

1. Declare a SAI_HandleTypeDef handle structure (eg. SAI_HandleTypeDef hsai).
2. Initialize the SAI low level resources by implementing the HAL_SAI_MspInit() API:
   a. Enable the SAI interface clock.
   b. SAI pins configuration:
      - Enable the clock for the SAI GPIOs.
      - Configure these SAI pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_SAI_Transmit_IT() and HAL_SAI_Receive_IT() APIs):
      - Configure the SAI interrupt priority.
      - Enable the NVIC SAI IRQ handle.
   d. DMA Configuration if you need to use DMA process (HAL_SAI_Transmit_DMA() and HAL_SAI_Receive_DMA() APIs):
      - Declare a DMA handle structure for the Tx/Rx stream.
      - Enable the DMAx interface clock.
      - Configure the declared DMA handle structure with the required Tx/Rx parameters.
      - Configure the DMA Tx/Rx Stream.
      - Associate the initialized DMA handle to the SAI DMA Tx/Rx handle.
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx Stream.
3. The initialization can be done by two ways
   a. Expert mode : Initialize the structures Init, FrameInit and SlotInit and call HAL_SAI_Init().
   b. Simplified mode : Initialize the high part of Init Structure and call HAL_SAI_InitProtocol().

Note: The specific SAI interrupts (FIFO request and Overrun underrun interrupt) will be managed using the macros __HAL_SAI_ENABLE_IT() and __HAL_SAI_DISABLE_IT() inside the transmit and receive process.

Note: Make sure that either:

- *PLLSAI1CLK output is configured or*
- *PLLSAI2CLK output is configured or*
- *PLLSAI3CLK output is configured or*
- *External clock source is configured after setting correctly the define constant EXTERNAL_SAI1_CLOCK_VALUE or EXTERNAL_SAI2_CLOCK_VALUE in the stm32h5xx_hal_conf.h file.*

Note: In master Tx mode: enabling the audio block immediately generates the bit clock for the external slaves even if there is no data in the FIFO, However FS signal generation is conditioned by the presence of data in the FIFO.

Note: In master Rx mode: enabling the audio block immediately generates the bit clock and FS signal for the external slaves.

Note: It is mandatory to respect the following conditions in order to avoid bad SAI behavior:

- *First bit Offset <= (SLOT size - Data size)*
- *Data size <= SLOT size*
- *Number of SLOT x SLOT size = Frame length*
- *The number of slots should be even when SAI_FS_CHANNEL_IDENTIFICATION is selected.*

Note: PDM interface can be activated through HAL_SAI_Init function. Please note that PDM interface is only available for SAI1 sub-block A. PDM microphone delays can be tuned with HAL_SAIEx_ConfigPdmMicDelay function.

Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_SAI_Transmit()
- Receive an amount of data in blocking mode using HAL_SAI_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_SAI_Transmit_IT()
- At transmission end of transfer HAL_SAI_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_SAI_Receive_IT()
- At reception end of transfer HAL_SAI_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_RxCpltCallback()
- In case of flag error, HAL_SAI_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SAI_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_SAI_Transmit_DMA()
- At transmission end of transfer HAL_SAI_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_SAI_Receive_DMA()
- At reception end of transfer HAL_SAI_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_RxCpltCallback()
- In case of flag error, HAL_SAI_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SAI_ErrorCallback()
- Pause the DMA Transfer using HAL_SAI_DMAPause()
- Resume the DMA Transfer using HAL_SAI_DMAResume()
- Stop the DMA Transfer using HAL_SAI_DMAStop()

SAI HAL driver additional function list

Below the list the others API available SAI HAL driver :

- HAL_SAI_EnableTxMuteMode(): Enable the mute in tx mode
- HAL_SAI_DisableTxMuteMode(): Disable the mute in tx mode
- HAL_SAI_EnableRxMuteMode(): Enable the mute in Rx mode
- HAL_SAI_DisableRxMuteMode(): Disable the mute in Rx mode
- HAL_SAI_FlushRxFifo(): Flush the rx fifo.
- HAL_SAI_Abort(): Abort the current transfer

SAI HAL driver macros list

Below the list of most used macros in SAI HAL driver :

- __HAL_SAI_ENABLE(): Enable the SAI peripheral
- __HAL_SAI_DISABLE(): Disable the SAI peripheral
- __HAL_SAI_ENABLE_IT(): Enable the specified SAI interrupts
- __HAL_SAI_DISABLE_IT(): Disable the specified SAI interrupts
- __HAL_SAI_GET_IT_SOURCE(): Check if the specified SAI interrupt source is enabled or disabled
- __HAL_SAI_GET_FLAG(): Check whether the specified SAI flag is set or not

Callback registration

The compilation define USE_HAL_SAI_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_SAI_RegisterCallback() to register a user callback.

Function HAL_SAI_RegisterCallback() allows to register following callbacks:

- RxCpltCallback : SAI receive complete.
- RxHalfCpltCallback : SAI receive half complete.
- TxCpltCallback : SAI transmit complete.
- TxHalfCpltCallback : SAI transmit half complete.
- ErrorCallback : SAI error.
- MspInitCallback : SAI MspInit.
- MspDeInitCallback : SAI MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_SAI_UnRegisterCallback() to reset a callback to the default weak function. HAL_SAI_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- RxCpltCallback : SAI receive complete.
- RxHalfCpltCallback : SAI receive half complete.
- TxCpltCallback : SAI transmit complete.
- TxHalfCpltCallback : SAI transmit half complete.
- ErrorCallback : SAI error.
- MspInitCallback : SAI MspInit.
- MspDeInitCallback : SAI MspDeInit.

By default, after the HAL_SAI_Init and if the state is HAL_SAI_STATE_RESET all callbacks are reset to the corresponding legacy weak functions: examples HAL_SAI_RxCpltCallback(), HAL_SAI_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the HAL_SAI_Init and HAL_SAI_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SAI_Init and HAL_SAI_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SAI_RegisterCallback before calling HAL_SAI_DeInit or HAL_SAI_Init function.

When the compilation define USE_HAL_SAI_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

65.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and de-initialize the SAIx peripheral:

- User must implement HAL_SAI_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_SAI_Init() to configure the selected device with the selected configuration:
  - Mode (Master/slave TX/RX)
  - Protocol
  - Data Size
  - MCLK Output
  - Audio frequency
  - FIFO Threshold
  - Frame Config
  - Slot Config
  - PDM Config
- Call the function HAL_SAI_DeInit() to restore the default configuration of the selected SAI peripheral.

This section contains the following APIs:

- ***HAL_SAI_InitProtocol()***
- ***HAL_SAI_Init()***
- ***HAL_SAI_DeInit()***

- *HAL_SAI_MspInit()*
- *HAL_SAI_MspDeInit()*
- *HAL_SAI_RegisterCallback()*
- *HAL_SAI_UnRegisterCallback()*

65.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the SAI data transfers.

- There are two modes of transfer:
